Extract from one of the leading Garden Journals, dated March 17, 1923:—
"MRS. PYM'S HARDY PLANTS.—This is a catalogue of Hardy Plants for beds, borders and rockeries, also Hardy Climbers, Vegetable and Greenhouse Plants, all of which are in small lots priced carriage paid and offered on money back terms. There is no plant catalogue more to be recommended to the amateur gardener. It is post free from Mrs. Pym, and readers may order therefrom with every confidence of entire satisfaction."

Mrs. PYM, F.R.H.S., 10, Vine House, Woodston, Peterborough

The Silver Medal Horse Shoe Boiler

THE WORST OF ORCHARD PESTS,

Psylla Mali (Apple Sucker), the tiny insect which attacks and destroys opening apple blossom buds, will shortly make its appearance. Nico Soap is the remedy and stocks should be procured at once. There is nothing so good as Campbell's English-made Nicotine Insecticides for destroying all sucking insects.

CAMPBELL'S ENGLISH NICOTINE, 95-98 per cent. guaranteed, prices on application.

CAMPBELL'S NICO SOAP (Nicotine Soap). The best Potash Soft Soap plus 7½ per cent. Nicotine, unrivalled for syringing or spraying. Prices—½ lb., 2/-; 1 lb., 4/-; 10 lb., 32/-.

CAMPBELL'S NICOTINE VAPORISING COMPOUND. Nicotine content, 50 per cent. Prices—10z., 1/6; 4oz., 3/9; 8oz., 7/6; ½ pint, 9/-; 1 pint, 17/6; ½ gallon, 61/-.

CAMPBELL'S NICOTINE FUMIGATING ROLLS, very simple and effective. In four sizes, for 500, 1,000, 2,000 and 3,000 cubic feet. Prices—7d., 10d., 1/6 and 2/- each.

CAMPBELL'S PATENT SULPHUR VAPORISER. The best method of exterminating Mildew from plants in greenhouses. In two sizes, for 5,000 and 10,000 cubic feet. Prices—18/- and 20/- each.

CAMPBELL'S LEMON OIL INSECTICIDE, splendid for sponging, dipping, or syringing stove and greenhouse plants. Pints, 2/3; quarts, 3/10; ½ gallon, 6/10; gallon, 12/- each.

CAMPBELL'S WEEDKILLER. One gallon makes 51 gallons for use. Per gallon, 7/-; 2 gallons, 13/-.

Obtainable from Seedsmen or, in case of difficulty, direct from the Manufacturer,

J. D. CAMPBELL, Nicotine Manufacturer,
LUND STREET, CORNBROOK, MANCHESTER.

Vickers' GARDEN FERTILISER

A PERFECT PLANT FOOD FOR FRUIT,
FLOWER, AND VEGETABLE GARDENS.

[APRIL 7, 1923.]

INTERESTING SPRING-FLOWERING BULBOUS PLANTS

IT is astonishing what a wealth of garden beauty is practically unknown to the great majority of garden owners. Granted that a very large proportion of plant-lovers have very small—too small—gardens, it is none the less remarkable that there is such a comparative scarcity of many interesting species and even genera in private places. This is as true of spring-flowering bulbous plants as of any section of hardy plants. Daffodils, Florist' Tulips, Hyacinths and Dutch Crocuses are to be found in practically every garden, but when we come to the very beautiful and interesting little Daffodils of the Hoop-Petticoat, Angels' Tears and cyclamineus sections, to mention but three, in how many gardens can we find them?

How often does one see even the commonest of the species Tulips growing, or species Crocuses for that matter? All the Fritillarias and Erythroniums are really uncommon. There must be many thousands of gardens of some size in which even our beautiful native Snakeshead, Fritillaria Meleagris, is wanting, and the same may be said even of the common Dog's Tooth Violet, Erythronium Dens-canis. The glorious sky blue Muscari Heavenly Blue is still a catalogue name to many, and even the old Grape Hyacinth, Muscari botryoides, which was fairly common in Victorian days, is now almost a rarity.

Of the small Narcissi, none is more interesting than the forms of the Hoop Petticoat Narcissus, N. Bulbocodium, but as these were described as recently as the issue for March 17, page 130, there is no need to cover the ground again.

Besides the Bulbocodiums and the Angels' Tears, there are such tiny and beautiful species as N. minimus, a perfect little trumpet Daffodil which scarcely exceeds

jins, in height. This little charmer does admirably in the heath garden, or, in peaty soil, it will flourish on a rocky bank. N. nanus is a giant by comparison with the last, yet it scarcely ever grows taller than Gins. The blossoms are a deep golden yellow, and it is very effective among short grass on banks or mounds.

Of Tulip species none is easier or more beautiful than T. Kaufmanniana, an April-flowering kind of very variable colouring, but, as generally sold, soft creamy yellow tinged on the exterior with pink. T. Greigi, also April-flowering, is also fairly easy, though it seldom increases to any extent. This is a large-flowered species with brilliant vermilion blossoms; the leaves are handsomely blotched with purplish brown.

The wild species which is the parent of the May-flowering Darwin Tulips, T. Gesneriana, is admirable. It is, as might be expected, a tall grower, and the brilliant crimson-scarlet blossoms, each with a conspicuous black zone at the base, are sweet scented. T. dasystemon is a pretty little species very distinct from any of the florists'

Tulips in that it habitually bears several flowers on a stem; strong bulbs will produce as many as seven. The blossoms, in their garb of yellow edged with white, remind one of that brilliant Californian annual, Linum Douglasii. T. persica also bears two or more blossoms on each stem. This is a dwarf species, and the bright yellow flowers, which are bronzed externally, are fragrant. It is best, therefore, in the rock garden and not too far from the eye. Tulipa sylvestris is a native of Britain and worth growing for its fragrance alone. In colour it is pale yellow, touched at the edges with red. There are a great number of other Tulip species, but these should suffice for the beginner to try.

When we come to the Crocus species, considerable selection is necessary, for an article could easily be written upon this topic alone. Crocus Sieberi is a Grecian species of bright lilac colouring in the typical form, with orange at the base; but the natural variety, versicolor, has a wider range of colouring—white, purple and lilac being mottled and striped above the orange base. This form

is illustrated on page 168. Crocus Imperati is one of the largest of the species Crocuses, yet, if size be a desideratum, it falls short of the Giant Dutch sorts. There is a beautiful clear rose form and also a pure white. This is quite one of the best of the very early-flowering species. Crocus Tommasinianus is one of the most beautiful and useful. It flowers just before C. vernus and the Dutch varieties raised from that species. In its most usual form it is what Mr. Bowles calls amethystine-violet, but there are deep purple and pure white varieties as well as one called pictus with dark blotches at the petal-tips. There are numbers of other spring-flowering species and several good

ONE OF THE CHARMING HOOP-PETTICOAT NARCISSI, N. BULBOCODIUM CITRINUS.

NARCISSUS JOHNSONI, A BEAUTIFUL NATURAL HYBRID (N. PSEUDO-NARCISSUS X N. TRIANDRUS).

LILAC, WHITE AND PURPLE, ORANGE CENTRED—CROCUS SIEBERI VERSICOLOR.

THE BEAUTIFUL BLUE MUSCARI-LIKE HYACINTHUS AZUREUS.

common flowering ones all easy to grow and beautiful. Of the white, probably *C. speciosus*, a rich bluish purple hue with a touch of gallant orange provided by the stigmata, is the best.

Fritillaria Meleagris, the Snake-head, still to be found wild in some of our English meadows, is equally easy in turf land or in garden soil. It does not like too hot a situation, but will grow and increase on banks facing east or west, and does not disdain the light shade of deciduous trees. It will flourish on light sandy soils, but probably prefers a moderately grassy loam. When the quaintly-spotted bells reach a height of 2ft. or more, as they will easily do when happy, this is a most effective plant. It is also excellent for cut flower. There are now quite a number of named varieties, but those who have never grown the Snakehead would be well advised to try the typical plant and its even commoner white (or whitish) variety first. Afterwards stock can be rapidly increased from the seeds which are produced in such abundance. Of the other *Fritillarias* we may neglect the Crown Imperials (*F. Imperialis*), since everyone knows them, though, strangely enough, they are little grown nowadays.

F. aurea is a pretty little kinsman of our native Snakehead, but dwarfer growing, and the blossoms are pale yellow spotted brown. *F. Burnetii* is a very early-flowering species with plum-coloured blossoms chequered yellowish green. *F. latifolia*, except for its broader foliage, is very like the Snakehead. There is a number of named varieties, and it may be naturalised as easily as the Snakehead. *F. recurva* is a species with bulb scales like those of a Lily. The whole genus is very nearly related to the true Lilies. The species under notice is late spring flowering and has bright crimson blossoms on slender purplish stems. It likes a warm, sheltered situation, and is not so easy to grow as are most of the species. The Golden Snakehead, *F. Moggridgei*, is beautiful when naturalised in grass, or it may be grown in the rock garden. An alpine species, the flowers are large and golden yellow, chequered brownish crimson on the inside of the bell. *F. pubera* is another charming species, like *F. recurva*, a native of California. It likes a warm corner to ripen the bulbs, and will then produce its golden yellow flowers abundantly. It is quite a dwarf species. There are, of course, other interesting *Fritillarias*, but these few will suffice to start a collection.

Comparatively few gardeners have any conception of the beauty of the better *Erythroniums* when naturalised, for in suitable soils and situations naturalise themselves they all will. Perhaps *E. revolutum* is the most useful species. Some of the forms of this are magnificent and easy to grow. White Beauty has self-coloured flowers of a delightful buttery-cream tone with all the finish we expect in the lily family. The blossoms are not seldom pins, a rosette and when established the flower stems are often more than a foot in height. No one who has only seen this plant as a pigmy specimen in a small pot at a Royal Horticultural Society's meeting can form any conception of its beauty in the garden. This, indeed, applies to all the American species and varieties. Other good forms of *E. revolutum* are Johnsoni, clear pink, and Watsoni, cream colour with a rosy zone. *E. Pink Beauty* is a fine rosy pink sort which makes an excellent companion to White Beauty, but is obviously not very closely related. *E. americanum* is a pretty, clear yellow species with red spots, but not free to flower. The soft yellow and orange *E. Howelli*, rather a rare plant at present, is more floriferous. All in this country like at least half shade and a compost consisting largely of leaf mould. They may easily be naturalised in the rock garden or, of course, in "coppy" parts of the wild garden.

FURTHER FREESIA NOTES

DUDS."—I was every bit as glad to read Mr. Dalrymple's notes on March 17 as he was to read mine. I am very hopeful about our getting the better of "duds," and I fancy we have got to realise that a good baking in their pots is not a sufficient preparation in itself and the after-care of the bulbs also must be attended to. They need to be kept warm and dry until they are planted. The experiment I made last autumn has given satisfactory results. Realising what a cold and sunless ripening season the corms had had, quite late on in the planting season, I put some third-sized "mixed" in a warm, airy cupboard where they remained for weeks. They were in due course planted, and at the same time an equal number that had remained in their boxes in the greenhouse. The result is very striking. While the pots with the non-heated ones are full of "duds," there are only two or three in the others. This experience is worth following up. Alas! I can cap the worse record of my own bulbs with as bad or even "worse" from some received from Dutch and English firms (not from

a Byron and awake one morning and find oneself famous, but when the reverse is the case the less said the better. This last lot is that of Daddy-long-legs. When that variety flowered in 1921 practically all the stock was a wash-out. Only a very few flowers remained unblotched and unmarked—and such hideous markings and blotches! Daddy-long-legs is now a memory only. These mauve and lavender coloured varieties are tiresome things. Here to-day and gone to-morrow. I have got a truly astonishing mauve—an altogether super-Freesia—which without any pressing out measures from 2½ ins. to 2½ ins. across its perianth; but what says latter experience?

"Dame Fortune is a fickle gipsy

Sometimes for years and years together
She'll bless you with the sunniest weather,

Then in a moment—Presto, pass!—
Your joys are withered like the grass."

Can anything be done to prevent this? Are

Then as to whites. We will before very long have varieties which will leave *Purity* and *retracta alba* far behind. Thanks to a present from America I have got a splendid new race of whites—very tall, very vigorous, very floriferous and very large in flower. Probably what I have got others have too, hence I think an advance all along the line may confidently be expected. This year one of my tip-toppers had six flowers larger than half a crown open at once. I am afraid pink and rose shades are going to be the weaklings of the *Freesia* family. The contrast between my batches of new seedling yellows and whites and the new seedling pinks and roses is very great. These last look poor and small behind their more robust brothers, and they do not improve with age. True there are exceptions which prove the rule. *Conquest* is one of them. It is a delightful variety. So, too, I used to think *Rosa Bonheur*, but I have not grown it for some years.

I wonder what *Bartley Rose* is like. I saw it when it got its award in 1910, but I have no very clear picture of it in my mind. None of these three is as near a true pink as *Pinkie* (A.M., 1910), but *Pinkie* is not what one would call a particularly good doer. My seed pans have sent up a large real pink this year far beyond my extreme flights of fancy. Will the plant prove healthy and strong? Will it keep a self? *Experientia docet*. I must possess my soul in patience and try to keep calm. JOSEPH JACOB.

ON THE LEFT, REV. J. JACOB'S YELLOW FREESIAS; ON THE RIGHT, A DUTCH "GOLDEN" FORM.

Mr. Dalrymple). Another point that needs consideration is whether some varieties are more to given "dudding" than others. While my beautiful big pale primrose, *Primrose Day*, so far has been free, there are one or two which produce far too many. They were practically without them after the hot summer of 1921. Yet another thing that I have noticed and which I think is worth mentioning is that very few are to be found among seedlings flowering for the first time or among the smaller offsets of older bulbs.

ON "BREAKING."—On the whole I seem to agree with Mr. Dalrymple, but not when he condemns the loose, open flower. I conclude he means those of the type of my Daddy-long-legs, which received an award of merit on March 11, 1919, and which attracted a large amount of favourable attention because it marked a novel type of flower. It is very nice, no doubt, to be

there any mauves or pinks that are immune? These are important questions. At the same time let me say that I think some of the broken forms are "quite all right" and are likely to find favour in the eyes of the public.

VARIETIES.—I have grown all the yellows I could get together this last year, and my verdict is, "Very disappointed." *Goldfinch* and *Golden King* are too tubular and very small. *Daffodil*, *Apogee*, *Buttercup*, *Treasure* and *Success* are too much alike for all to be wanted, and are very little more than deep primrose in colour. Nevertheless, they are decidedly attractive; but to call *Daffodil* "bright yellow and orange" and *Success* "uniform deep yellow" are rather stretches of the imagination. Not one goes in depth of colour beyond the primrose yellow which describes *Apogee* and *Buttercup*. No one has seen my *Flame* and *Yellow Emperor* or they would know what I call a yellow

EDITOR'S TABLE

SOME NEW LACHENALIAS.

FROM the Rev. Joseph Jacob, Whitewell Rectory, Whitechurch, Salop, came to hand recently a goodly number of spikes of new *Lachenalias*. There were eight varieties altogether, of which the following is a brief description: *LEIDEN* is deep orange flushed with scarlet at the apex, the stem beautifully spotted; the spacing of the bells is excellent, and altogether this is a remarkably handsome variety. *AFRICA* has a golden tube (small compared with the last) edged at the mouth with brown; the sepals are lightly tipped green and the stem is slightly maculated. *JAPAN* is golden yellow and green, the sepals heavily flushed with orange scarlet; this variety is much in the way of *L. tricolor*. *MONTE CARLO* is much like the last, but the tube is tipped with brown and the flush on the sepals lighter.

TANGIER is a flower of different calibre altogether. The blossoms are soft golden yellow, edged bronzy plum; the petals open out much like those of a *Bluebell* and the stem is much maculated; there are comparatively few bells to a spike, but this is, none the less, a very remarkable addition. *WINDSOR* is much in the way of the last, but the flowers are arranged more to the top of the spike and the sepals are distinctly tipped green. *MANDALAY* is almost a deep golden yellow self, but the bells are touched with scarlet at the apex; the blossoms are very large, well arranged and open-throated, and have very beautiful and conspicuous chocolate stamens. The stems are heavily blotched brown. *SIAM* has waxy golden yellow flowers, the tube fairly expanded at the mouth; this is a green-stemmed variety.

As far as it was possible to judge from the cut spikes, the four outstanding varieties are *Leiden*, *Tangier*, *Mandalay* and *Siam*. All four represent a great advance on anything yet seen in *Lachenalias*.

THE MECONOPSIS FAMILY

THIS popular genus is now known to consist of over forty species, several of which have been introduced into cultivation during the last twenty years.

All but two are found in the Himalayas and on the mountain ranges of Western China and Tibet. Of the other two, one, *M. cambrica*, is the well known Welsh Poppy, one of the few perennials in the genus; the other, *M. heterophylla*, is a Californian annual. Of this number quite half have been or are now in cultivation in this country, but as the majority are biennials and do not set good seed freely in many places, only a few have become in any way plentiful in gardens. Till the yellow-flowered *P. integrifolia* was introduced from Western China, the Himalayan *P. Wallichii* was first favourite with its drooping blue flowers, and it possibly still holds that position in spite of the new arrival.

With the exception of the Californian annual and the Welsh Poppy, all the species are high alpine plants, found at elevations of 10,000ft. and over. *M. horridula* enjoys the distinction of being found at the highest altitude, which is 17,500ft., both in the Himalayas and in Western China. From these altitudes to our sea level conditions is a far cry, and it is no wonder that many of these attractive plants are difficult to grow and refuse to become acclimatised. The best we can do is to give them a shady or partly

shaded position, planted in rich, moist and thoroughly drained soil. This should consist of good fibrous loam, to which may be added a generous proportion of peat and leaf-soil with plenty of sand to keep it open. Some species, like *M. Wallichii*, prefer more peat than others, while *M. integrifolia* likes good loam with plenty of manure beneath. A selection of the best species in cultivation is given below in alphabetical order.

M. ACULEATA. This species is a native of the Western Himalayas, from Kashmir to Kumaon, growing at elevations of 11,000ft. to 15,000ft. It first flowered in this country in June of 1864. It is a biennial, producing the first year a rosette of prickly hairy leaves having a sinuate margin. In the following May a 2ft. stem is formed, bearing on its full length the beautiful large flowers singly on long stalks. In the best forms the flowers are a good blue, some 2ins. across, the beauty of the blossom being enhanced by the ring of yellow stamens.

M. CAMBRICA.—The Welsh Poppy is a well known perennial with yellow flowers, very useful and desirable for naturalising in the rock garden or on shady rocky banks. It reproduces itself freely from seeds and varies in colour from bright yellow to orange. There is also a beautiful double-flowered orange variety.

M. CHELIDONIFOLIA.—A pretty plant, but not

so attractive as many of the other kinds. It is another of the few perennials in the genus, and is a native of Western China. It was found by Wilson in Szechuen, and grows about 2ft. high, with soft chelidonium-like leaves and clear yellow, saucer-shaped flowers 2½ins. across. These are produced in July. It is easily increased by division and also by means of the bulbils which are produced on the stems.

M. DELAVAYI.—A delightful little alpine species from Yunnan, with large, solitary, deep violet, pendent flowers on stems 2ins. to 6ins. high. The leaves are few in a rosette, ovate to lanceolate, on long stalks, pale green above and glaucous below. This plant was found by Forrest and flowered at Edinburgh in May, 1911.

M. GRAYII.—A Himalayan species growing only in Sikkim, which is somewhat like *M. integrifolia* in habit, but is perennial in some places. It has entire leaves with stems up to 2ft. high, bearing two or three large purple flowers.

M. HETEROPHYLLA.—A beautiful annual from California, growing from 1ft. to 2ft. high, with orange red flowers having a darker red-purple base. It is the sole American representative of the genus, as *M. cambrica* is the sole European one. It is easy to grow in an open sunny border, and should be sown where it is to flower.

M. INTEGRIFOLIA.—Much has been written about this handsome Poppy since it was introduced by Mr. E. H. Wilson when plant collecting in Western China for Messrs. Veitch and Sons. He first found it in Kansu, but it has a wide range

THE SPLENDID PALE AZURE MECONOPSIS LATIFOLIA.

MECONOPSIS CHELIDONIFOLIA, A GOOD PERENNIAL YELLOW-FLOWERED SPECIES.

RICH BLUE OR VIOLET, MECONOPSIS RACEMOSA.

from there to Yunnan and Central Tibet. It is said to grow in alpine meadows, whole hill-sides being starred with its sulphur-coloured, nodding flowers. The species is never found below 11,000ft., while 15,500ft. marks its higher limit. From a tuft of entire hairy leaves it produces a stout stem 2ft. or more high, which bears from four to six flowers, each from bins. to 10ins. in diameter. It was first shown in flower in May, 1905, at a meeting of the Royal Horticultural Society, by Messrs. Veitch and Sons, and attracted much attention at the time. It grows well in strong loamy soil.

Closely allied to this is *M. pseudointegrifolia*, which differs in having a distinct style and narrower stigma. It is a native of Southern Tibet.

M. LATIFOLIA.—Somewhat like *M. aculeata* in habit, but the whole plant, leaves and stems, is covered with stiff bristles. It grows about 2ft. high and bears pale purplish blue flowers in May. This species was introduced from Kashmir in the spring of 1906.

M. PANICULATA.—One of the best known species, this is a yellow-flowered plant from the Himalayas, in habit like *M. Wallichii*, but shorter, and with less divided leaves. It is a biennial.

M. PUNICEA.—This is another of Wilson's finds in Western China, which flowered about the same time as *M. integrifolia*. It is of very striking appearance, bearing solitary, drooping flowers of a crimson colour on a stem about 18ins. high. It has not proved easy to grow, and has almost, if not quite, gone out of cultivation.

M. QUINTUPLINERVA.—One of the few good perennials in the genus, this species make a mat of foliage and produces its nodding flowers singly on stems 1ft. or more high. In colour it varies from blue to purple. It has proved easy to grow in gravelly loam in a shady situation. Mr. Farrer spoke very highly of this plant, which is a native of Northern Tibet and Kansu.

M. PRATII.—A free-growing plant, growing from 2ft. to 3ft. high, with entire leaves and long racemes of pale blue or purple flowers. From Western China.

M. RACEMOSA.—In habit like the above, but covered with stiff hairs on the leaves and stem. The flowers vary in colour from the deepest purple to pale lilac. This is really only a form of *M. horridula*, but it has its flowers in a raceme instead of solitary.

M. SIMPLICIFOLIA.—This Himalayan species is a biennial, which during the first year forms a rosette of entire, lance-shaped leaves, and in the following spring produces its solitary flowers on hairy stems up to 1ft. high. These are usually of a dull purple colour in the type. A form, however, has been recently introduced by Captain Bailey which bears lovely pale blue flowers which are fully 4½ins. in diameter. It is a most desirable variety, each plant bearing several flowers.

M. WALLICHII is, without question, the finest member of the genus from a garden point of view.

This Himalayan species is a very popular plant, and when well grown in a cool, shady spot it is a very beautiful object. It dies after flowering, but often takes two or three years to flower from seed. Its rosettes of beautiful foliage, however, are very ornamental and often reach a diameter

THE FRAGRANT ORANGE SCARLET AND BLACK ANNUAL,
MECONOPSIS HETEROPHYLLA.

of 3ft. or more. Owing to the hairy nature of the foliage it is very susceptible to damp in winter, and in some places it is necessary to protect the crowns with glass to throw off the rain. The leaves are pinnatifid and covered with golden russet hairs, as well as the stems. In favourable positions the stems often reach a height of 7ft. or more, bearing large panicles of lovely blue flowers. Individually they do not last long, but they are produced freely in succession. There is a variety in cultivation with dull purple flowers. W. L.

GERBERA HYBRIDS

I PREFER to call these *Gerbera* hybrids rather than hybrids of *Gerbera Jamesoni*, because they are no less the hybrids of *G. viridifolia*, for all the colours that are valuable—apart from the orange-scarlet, the scarlet and the yellow obtained from *G. Jamesoni*—are due to the intervention of *G. viridifolia*, which is always, I think I may say, clearly evident in the shape of the leaves. In answer to a correspondent in the issue of March 17, page 142, reference is made only to varying shades of orange-scarlet, but for all colours approaching scarlet there is nothing better than the true *G. Jamesoni*, and the flowering season is longer. The colours to be required from the hybrids are the two colours of the first cross, viz., white and pink, which came without any others, the white being exceptional, salmon colours in variety, yellows to orange and altogether a number of variations which have been counted, I believe, up to the number of about fifty, and especially a port wine or claret colour called after me by M. Adnet of the Cap d'Antibes. This finely coloured flower derives all its beauty from the back of the petal of the rather dirty white *G. viridifolia*, which is of the same colour. It appeared at Cambridge among my early crosses and afterwards with M. Adnet, who of all growers laid himself out to produce results; indeed, I do not know where the best hybrids are now to be found, except perhaps a few at Cambridge and with M. Adnet, if his firm has found it a paying proposition to continue to grow them. They are perfectly easy to grow, but they must have the requisite attention, and it is a drawback that, like the common *Cineraria*, they should be self-sterile.

To perpetuate any choice colour exactly, it is necessary to have another plant of the same colour in flower in right condition at the same time. Nevertheless, it is astonishing what fine results can be obtained by best possible crossing. If seeds are sown as soon as ripe, there should be a fine flower in, say, a large 60 pot within about twelve months; but this implies a warm house during the winter. The plants should be grown without check to the first flower, and if I may give a hint, I would say sow the seed by sticking it in with the pappus upright. The root then goes down and the seed leaves come into position without having to turn. I must be brief, but I would wish to say that there is no difficulty whatever in setting seed. My own best account of *Gerberas*, I think, is in Robinson's "Flora and Sylva," Vol. III, page 206, with good plate by Moon. The misfortune for this plate was that the plants had almost all gone out of flower, leaving a poor selection. There is also a very good account in the *Revue Horticole* by M. Mottet, which has been translated and published in one of the English horticultural journals.

Hybrids of pure white, sunset and salmon colours were to be seen almost recently in the Cambridge Botanic Garden, but serving no special botanical purpose no speciality could be made of them.

As the raiser of *Gerbera* hybrids I feel a responsibility for shewing what they are, and if the colours to which I refer above are not now to be obtained there is a field of work open to someone who would take it up provided the materials can be obtained, the most important perhaps being a white like *G. viridifolia*, but distinction cannot properly be made. It is the light and delicate colours that are so attractive.

R. IRWIN LYNCH, V.M.H.

Chelston, Torquay.

EASTER FLOWERS AT VINCENT SQUARE

THE warm spring sunshine permitted exhibitors to show their spring flowers to the fullest advantage at the R.H.S. Hall on March 27 and 28 last. It was a very large Show, and the attendance during the afternoon taxed the capacity of the hall to the utmost.

Narcissi were the dominant feature of the Show, though forced bulbs and Roses were also very prominent. In most of the Narcissus collections it was the useful large Trumpet varieties that predominated by reason of their size and rich golden colouring as well as in numbers. In their very large collection Messrs. Barr and Sons had such sorts as Prospero, Chloria, Latone, Alexis and Carminata of this section, while their vases of Belarius, Proteus and Apricot Queen, besides many seedlings, were of great beauty. Mr. F. H. Chapman had in Rampant, Eminent, Bob Major and Stalwart exceptionally good large Trumpet varieties, though most attention was directed to Fortune, his magnificent Incomparabilis variety, which has a long orange-coloured tube surrounded by a yellow perianth.

In a fine collection by Messrs. J. R. Pearson and Sons, Weardale Perfection, Fairy and Florence Pearson of the large Trumpet Daffodils; Red Beacon, Sunrise and Lucifer of the Barrii group; and J. W. Macfield of the Poetaz were of great excellence. King Alfred was splendid in a group by Messrs. R. H. Bath, Limited, and other especially good large Trumpets were Golden Sunshine, The President and March White, Macbearer and

large double Ten de Jole were also much admired. In another place Messrs. Bath had a number of Darwin Tulips in bowls of fibre. Mr. J. L. Richardson gave prominence to his new Poetaz variety Glorious, and this was surrounded by such as Van Waveren's Giant, Comeragh and Cleopatra of the Trumpets, and Empire and King Cup of the Incomparabilis type.

A decorative exhibit of Narcissus King Alfred, Tulips Fon Brilliance, Sweet Lavender and King Harold was made by Messrs. Carter and Co.; and the Maytham Gardens arranged such Tulips as La Merveille, Louise de la Vallière, Gold-lush and La Tulip Noire very attractively. A great number of Dutch Tulips was displayed by Messrs. R. and G. Cuthbert, and these included King of the Yellows, La Remarquable, Prince of Austria, Le Rêve and Couleur de Cardinal.

The first coloured Freesias of the season were shown by Messrs. Sutton and Sons, who had mop-pets of the blush Merry Widow, Mouette, Treasure and the deep pink Robinette.

In the warm sunshine the Roses opened beautifully, and were almost equal in charm to outdoor blooms. The colouring of Padre, which was shown by Mr. George Prince and Mr. E. J. Hicks, was most delightful. Mr. Prince also had vases of the deliciously fragrant Florence H. Veitch and the rare species Rosa hemispherica, bearing small double yellow flowers. Primrose Pirrie, shown by Messrs. E. Cant and Co., is a good new Rose for forcing. Sovereign, Phoebe and Golden

Ophelia were staged in fine condition by Messrs. B. R. Cant and Co.

There did not seem to be any novelty among the Carnations, though the vases of the fancy varieties attracted considerable attention. Wivelsfield Fancy and Chintz, shown by Messrs. Allwood Brothers; and Rani, Benara and Circe by Mr. C. Engelmann, were very attractive. The Hon. Charlotte Knollys, Hon. Nita Weir and Eileen Low, staged by Messrs. Stuart Low and Co.; and Carola, Cupid and Peerless by Messrs. Keith Lufford and Co. were very fresh and bright.

Among the shrubs, the Rhododendrons were the most showy. Mr. C. E. Heath sent from his garden at Anstie Grange, Holmwood, trusses of such sorts as calophytum, sutchuenense, Chilonii, ciliatum and arboreum superbum. Among the collection by Messrs. R. Gill and Co. there were many branches of R. Cornish Red, one of the oldest R. arboreum varieties. They had a photograph of part of a tree growing at Falmouth which is said to have borne as many as 5,000 trusses in one season. R. zelanicum is a rare species, and bears compact pyramids of rich crimson flowers. Messrs. Gill also had flowers of their good strain of single St. Brigid Anemones. The double varieties were well represented by Messrs. Reamsbottom and Co. with a goodly space filled with gorgeous blooms. Among the Rhododendron exhibits was a very interesting collection of R. arboreum seedlings sent by Mrs. Haywood Johnstone from Bingley Park, Pulborough. There

THE ROSY-BLOSSOMED PURPLE-LEAVED PRUNUS BLAIRIANA.

A FINE GARDEN POETAZ NARCISSUS WITH FIERY CUP, N. GLORIOUS

were many desirable varieties among them, and all the trusses were of unusually large size.

Forced shrubs were also a prominent feature. Messrs. Wallace and Co. had many excellent *Azalea mollis*, so good as to justify the names they gave them. *Wistarias* and *Laburnums* were also well shewn. *Azaleas*, with many little plants of *Clematis*, each bearing four or more flowers, were attractively arranged by Messrs. L. R. Russell, Limited, who also had a small plant of *Francisea calycina major*, a greenhouse plant bearing rich blue flowers.

Cheiranthus Allionii was included by Mr. G. G. Whitelegg with some uncommonly good *Saxifrages* and many dwarf conifers. *Thymus citriodorus aureus* of good colour was staged by the Chalk Hill Nursery Company, who also had quantities of double mauve *Primrose*.

In distinct colours—blue, deep crimson, yellow and white—Messrs. Blackmore and Langdon displayed a large number of excellent *Polyanthuses*. These flowers were also well shewn by Mr. F. G. Wood, his crimson varieties being particularly attractive. Messrs. Clarence Elliott had an interesting exhibit of alpine, including a specially fine pan of a good form of *Primula Allionii*.

Mr. Maurice Prichard had the dark-coloured *Aubrietia* H. Marshall and some well flowered plants of *Morisia hypogaea* among an interesting collection.

Messrs. Cheal's exhibit was especially noteworthy for *Anemone nemorosa Robinsoniana*, *A. apennina*, *Aubrietia* Lloyd Edwards and a patch of the brilliant *Anemone fulgens*.

Among an interesting collection of alpine from Mr. G. Reuthe, a well flowered plant of *Rhododendron calophytum* was noteworthy. He also had bushes of the fragrant *Viburnum Carlesii*, which was also to be found in several other places in the Show.

Besides the Carnations mentioned above, Messrs. Stuart Low and Co. had some well flowered *Cyclamens* and an interesting collection of well grown *Acacias*. Some of the best were *diffusa*, *Riceana* and *armata*.

NEW AND RARE PLANTS.

***Berberis replicata*.**—This is evidently a rather compact-habited evergreen species, with glossy black-green leaves about an inch long and quantities of rather small greenish yellow flowers. This cannot be described as a showy species, yet as a bush in the open it would no doubt be effective, for, even in the hall, the blossoms were more effective from a little distance than close at hand. Sent from the Society's gardens at Wisley and granted an award of merit.

***Narcissus Calirrhoe*.**—The award to this large Trumpet Daffodil was as a show flower.

It is of quite large size, the perianth segments are paper white in colour, though of good texture, and the shapely trumpet is a deep lemon colour. Award of merit to Messrs. F. H. Chapman, Limited.

N. Glorious.—The name well described the colouring of this excellent Tazetta variety. The

immediately after it received an award of merit. On the present occasion several very floriferous bushes were shewn, and its great superiority to its ally *P. japonica* was more fully evident. First-class certificate to the Marquis of Headfort.

Prunus Blireiana fl. pl.—This highly decorative, hardy small tree received an award of merit a few years ago. It is a variety of *P. cerasifera* and, like *P. Pissardi*, bears showy purple foliage. At this season the stout, erect branches are wreathed with semi-double, bright rose-coloured flowers, making it the most beautiful of early spring-flowering trees. First-class certificate to Mr. R. C. Notcutt.

***Rhododendron rhododactylum*.**—This is a pretty little species, though of no great value for garden decoration. It is relatively small in all its parts. The loose trusses contained six campanulate white flowers which have dull rosy markings along the centre of the outsides of the segments. Award of merit to Lady Aberconway and Hon. H. D. McLaren.

Saxifraga Grisebachii Wisley var.—A large pan of well grown plants of this showy Saxifrage was on view. It differs chiefly from the type in its more robust habit and the more intense colour of the reddish leafy bracts along the flower-stems. Award of merit to Mr. Clarence Elliott.

Cattleya Suavior Low's var.—A very pretty little stove Orchid of the palest blush colour heavily flushed with velvety purple on the outer halves of the segments. Award of merit to Messrs. Stuart Low and Co.

***Laelio-Cattleya Nora*.**—A magnificent bloom, in which the deep mauve of the sepals and petals is set off by the rich velvety crimson of the large spreading lip. There are golden lines radiating from the base of the throat. Award of merit to Messrs. Cowans and Co.

***Odontoglossum Aurora var. Rajah*.**—This is a highly decorative variety. The erect spike bore flowers of deep chocolate maroon colour with a few paler spots at the margins. The distinct white lip has a golden crest. Award of merit to Messrs. Sander and Co.

SHIRLEY POPPIES

ONE of the most beautiful groupings of Shirley Poppies the writer has ever seen was quite an accidental one in a grass orchard which had been dressed with wood ashes from the garden bonfire, which had consumed the remains of the previous year's batch of Shirley Poppies. No doubt a considerable proportion of the ripe seeds had fallen through the heat and escaped the severest heat of the fire. The heat of the hot ashes the very hard seeds must, of course, have endured. Wherever there was a little bare earth in the orchard there were Poppies. In the cleared rings round the bases of the trees, of course, where a large heap of spent compost had stood long enough to kill much of the grass, even where a tunneling mole had left a thin place in the grass, there were Poppies—and such Poppies! None of them less than 3ft. high, some of the plants were almost as much through and they went on blossoming all summer through.

Now three lessons can, I think, be drawn from this object lesson. In the first place the "Shirleys" do not resent a little shade in summer. Secondly, the size and vigour of the plants must very largely have been due to the fact that the plants were not overcrowded—if a plant had 3ft. square of space to fill it very comfortably filled it. The third lesson, and the most obvious, is that these Poppies might well be used as the single Chinese Aster is at Kew; that is the seed might be sown with that of the grass when making good or returning takes place.

R. V. G. W.

A SPLENDID GIANT LEEDSII NARCISSUS—PRINCE UMBRIA.

twin flowers are of good size and shape. The perianth is white, and the compact corona the fiery orange colour associated with the very best Poeticus varieties. Award of merit to Mr. J. L. Richardson.

N. Golden Sunrise.—A useful large Trumpet Daffodil, recommended for garden decoration and as a cut flower. It is of deep yellow colour, and the sturdy fringed trumpet is widely expanded. Award of merit to Messrs. R. H. Bath, Limited.

N. Prince Umbria.—This is one of the newer hybrids that baffle classification. In some characters it is Giant Leedsii, while others would place it among the *Incomparabilis*. However, it is an uncommon bloom of striking appearance and large size. The perianth is paper white and the trumpet-like tube of pale yellow heavily stained with a much deeper shade. Award of merit to Messrs. Barr and Sons.

N. Provost.—A magnificent, large Trumpet Daffodil which is decidedly a show flower. The colour is a rich golden yellow. The long, somewhat pointed perianth segments are slightly twisted, giving a star-like appearance. The trumpet is very long, perfectly round, and the rim is beautifully frilled. Award of merit to the Rev. G. H. Engleheart.

***Pieris (Andromeda) taiwanensis*.**—We published an illustration of this beautiful hardy shrub in our issue of March 25, 1922, page 142, almost

A BORDER OF SIMPLE FLOWERS

The writer describes an effective scheme of border planting which is renewed season by season.

PERHAPS I should have entitled this article "A Border of Summer Flowers," but as I do not propose to mention any plants which may not be successfully treated as biennials, and as the majority are annuals, it would not be quite fair to do so and ignore the gorgeous perennials. With apologies, therefore, to the herbaceous border, I will endeavour to describe the planting of one which, when at its best, is equally as interesting. First of all, however, let me tell how we came to have this "biennial-annual" border, which, by the way, now goes under the name of the "simple border" and has become a yearly feature. We had been growing these beautiful flowers I shall mention rather extensively, planting them freely in the mixed border and wherever space permitted in the foreground of the shrubbery. Eventually, we came to having plots of ground for each. This method revealed them at their best, but it also exposed weaknesses which were not conspicuous when they were associated with other plants. This led to a border being devoted to annuals and plants best treated as biennials, and it was planted on lines similar to a modern herbaceous border. The result proved to be an unqualified success, since it ensured a wealth of glorious colour from the end of May until frost.

The following notes on the plants employed may, perhaps, be useful where a border has to be filled at short notice. The absence of biennials in nursery beds can easily be overcome at this season, since they can be purchased cheaply. The border having been manured and dug in winter, is made ready for planting when the weather is favourable from the latter end of March until about the end of April. Clumps of Sweet Peas at a distance of 1 ft. apart are planted along the back of the border, which in our case is about 10 ft. wide. The plants are raised in pots from seeds sown in autumn and wintered in a cold frame. The supports used are spiral wire rings, which are obtainable from horticultural sundriesmen. They answer their purpose perfectly, and are very durable. Ours have been in use for ten successive summers. Between these clumps Hollyhocks are planted, which were raised from seeds sown last April. Under this method of raising, disease has, so far, been conspicuous by its absence, and the growth is remarkable for its vigour. Canterbury Bells, naturally, play an important part in the whole scheme. The cup-and-saucer varieties are very striking in pink, white and blue, and they are planted in groups of separate colours, but far enough apart to admit of annuals coming between, otherwise there would be unsightly spaces, which would not be admired, after the biennials had ceased flowering. Sweet Williams are made equally as much of, but being dwarfier are placed nearer the front. The most pleasing variety among many we have tried is Sutton's Pink Beauty, a lovely rich salmon. White and scarlet are, of course, indispensable. We prefer these self colours, although the Auricle-eyed are very gay. All these plants were raised from seed sown in an open border last June. Though not strictly biennials, the long-spurred Aquilegias are never better than when treated as such. Care is taken to obtain a good strain of seed, and these are sown in April in boxes in a frame and subsequently pricked out in a border of rich soil, from whence they are taken and planted the following March. When in flower few plants are more

attractive, but being spare of foliage the groups should not be too large, in order that the bare spaces after flowering shall not be too conspicuous. The same cultural remarks apply to the popular Geum, Mrs Bradshaw, plants which have no superior where broad patches of vivid scarlet would be appreciated. Complaints are sometimes heard of these plants deteriorating after the first season, but we never run any risks; we sow annually. Another race of long-lasting, bright-flowering plants comprises the varieties of Lupinus

HOLLYHOCKS ARE A MAIN FEATURE OF THE SIMPLE BORDER.

polyphyllus. These make a remarkable display in the colours now available, which include a lovely soft pink, a lavender, pure white, and blue; there is a yellow, but of rather slower growth than the preceding. Seeds of these are sown in May and transferred to their flowering quarters

the following March. The graceful Gypsophila paniculata must also be included, for it does exceedingly well if sown now for next season's planting. Mention must also be made of Pansies and Violas. No attempt is made to employ either as an edging; they are simply placed near the front in clumps of a dozen or so plants. All are raised from seed sown in the previous June, and the variety is surprising, as well as the excellent form which the majority possess.

The first thing in the sowing or planting of annuals is to anticipate the bare spaces which inevitably result after the Canterbury Bells and Aquilegias have ceased flowering. Our method is to sow suitable varieties at the same time or very shortly after the plants are put in, very close to and sometimes among them. Clarkias of the elegans type are very useful for this purpose. They are quite hardy and remarkably gay, in colours which range from salmon scarlet through delicate pink to pure white. Godetias are equally as popular. There are tall and dwarf sorts, and both are available in all the choicest colours; but the mauves are best kept apart from the reds and pinks, for one spoils the effect of the other. The annual Delphiniums, or Larkspurs, are exceedingly attractive, and they very nearly take the place of the perennials of the same name in our border. Here also there are tall varieties for near the Sweet Peas and Hollyhocks, and dwarfier ones for associating with Aquilegias. Pink Pearl is a lovely colour, with Rosy Scarlet a close second. Blue, white and mauve are also obtainable. Annual Lupinus shew little inferiority to the perennial type. The Hartwegii varieties include a deep blue and a pure white, and there is a pleasing yellow in Menziesii. These are tall (nearly 3 ft.). Dwarf varieties in carmine and white, yellow, pink, white and blue are also well worth using freely. Another pleasing tall-growing annual is Lavatera rosea splendens. It makes quite a large plant, and is most striking when its bright rosy pink flowers are at their best. L. alba splendens is a white form. All these may be sown in early April where intended to bloom, and the chief thing afterwards is to thin them out severely, so as to leave each plant room to develop. Among dwarfier varieties there is a wide choice. Candytufts are quite as useful as Violas for massing near the edge, and for that purpose we employ the compact varieties freely, setting the spiral forms behind them. Few annuals shew greater improvement in the colours now available than these. Another pretty edging plant is Leptosiphon hybridus, embracing a beautiful combination of colours. The charming, and best, Love-in-a-Mist—Nigella Miss Jekyll—and Cornflowers in blue, pink and white are freely employed. The Iceland Poppy, P. nudicaule, is one of our most charming plants, the orange, scarlet, yellow and white flowers being a great attraction. These, of course, are treated as biennials. I omitted to mention above the free-flowering Coreopsis grandiflora, which is never a greater success than when treated in the same way as Canterbury Bells. Mignonette, so desirable and yet so apt to be erratic when sown in the open, we make sure of by sowing a pinch of seed in each of as many small pots as are required. The seeds germinate quickly in gentle heat, when the pots are removed to a cold frame, and planting out follows early in May. Other pretty annuals we invariably find room for include Linarias, Linums, dwarf Nasturtiums, the pretty blue Phacelia campanularia, Sweet Sultan and Viscaria. With the exceptions already noted seeds are sown in April, and judicious thinning is then all that is required to enable these simple things to combine together to furnish a wealth of beautiful flowers from the end of May until frost.

J. T.

CORRESPONDENCE

ABOUT LACHENALIAS.

I HAD the pleasure the other day of looking through the private garden of Mr. W. Manger of Messrs. W. Manger and Sons, bulb growers, etc., and saw a batch of seedling Lachenalias which I am sure would have greatly interested many of your readers. One all too seldom comes across these beautiful greenhouse plants nowadays, but could those under notice have been transported and put up at one of the London shows they could not have failed to arouse enthusiasm among all flower-lovers. I have been connected with flowers, etc., for over forty years, the earlier part of that time being spent in some of the best-kept gardens in England, and I have never seen Lachenalias nearly so well cultivated as these of Mr. Manger's. They like, as is fairly well known, a rich and open compost, and in this case it consisted of peat, well rotted manure, loam and sand with a little lime added, and they were grown in pans in rows, across and about 4 ins. deep. Some of the spikes are 20 ins. high and carry as many as twenty-four blooms without any stakes to support them. The colouring of some of them is beautiful, rich golden yellow of different shades, many of them brighter and deeper than Nelsoni. Some of them have a wide Indian red margin at the bottom of the blooms and bright red at the top streaking down the bells. Others are deep yellow at top, the lower part light green with a red margin. One very fine variety is red at top, green base with a broad red margin and very large bells. Only one of them has been named and will be known as Siam, a fine self golden yellow, strong, with splendid green foliage. It is not an easy matter to describe the colours of many flowers so as to convey a correct idea of the colouring some of them possess, and I am afraid it is too difficult for me in this case, but I can strongly recommend your readers to obtain some from the raiser and see them in their own greenhouses. These seedlings were obtained from the raiser, the Rev. J. Jacob, Whitechurch, Salop, who is a well known enthusiast in the raising of many kinds of flowers, and to whom the garden is so much indebted for many of his products. Both the raiser and the grower of these Lachenalias I have attempted to interest your readers in deserve high commendation.—H. BRITTEN, *Guernsey*.

[The Editor has attempted to describe some of the varieties under Editor's Table on page 169. It will be noted that at least eight varieties now have names.—ED.]

SPLENDID! Two good hard congratulatory slaps on the back, and now (THE GARDEN for March 17) a more gentle but none the less a most welcome pat from "G. C." Surely the tide has at last begun to flow in! Ostend, Riga and Boston are now back numbers. Greenland is almost eclipsed by Cork. I am more than ever thankful to that kindly Irishman who sent me my first bulbs. It is true, as he said, that growing them has been, up to now, the ploughing of a lonely furrow, but the fascination of fathoming the latent possibilities of what Nature has hidden in a few rather sombre species and varieties has been an ample compensation. The high water mark is represented by the beautiful waxy Siam; the tall, deep orange Leiden, made extra striking by its unique dark stems; Tangier, sturdy and red edged; the delightful yellow-bellied and red-topped spikes of Japan; Switzerland, with the wide red-edged, almost orange bells; and Britain, tall and vigorous, with large, open-mouthed, red-edged, deep yellow bells—the very emblem

of strength. Rosemary, which is the last Lachenalia to receive an award of merit from the R.H.S., is quite outclassed by some of the newest seedlings, of which as yet there are only two or three bulbs. Nelsoni is but a moon to Arabia. There is, I venture to think, an advance all along the line. Never before have we had such a show as we have this year, for, coupled with the greater beauty of the latest-born varieties, it has been a "Lachenalia year." My dear little children, cheerio! cheerio! Remember

"Even the weariest
river
Winds somewhere safe to
sea."

—JOSEPH JACOB.

PRIMULA SILVER STAR.

AS one who has never cared for Chinese Primulas, I am writing to own my admiration for Sutton's Silver Star. I consider this one of the most beautiful plants there is for the cool greenhouse and for table decoration indoors. I shall certainly grow a batch for next year. I also admire the new so-called "Star" Symmetry. This does not seem to stand carriage, so is not very effective at a show, but as I see it in my friends' houses it is splendid. Why call it a Star, though? There is nothing starry about it!—J. S.

[Many "Star" flowers are not starry. The original Primulas of this class *were* rather starry, and the name has attached itself to the type and would be difficult to uproot.—ED.]

MOISTURE-LOVING IRISES.

THE views expressed in the article on "Moisture-loving Irises" on page 143 are so heterodox that it seems worth while to enquire whether they are based on any evidence. Is it true, for instance, that there is no Iris in cultivation in this country "which is an aquatic in the sense that *I. pseudacorus* is"? Has it ever been proved that *I. versicolor*, its cousin from the Eastern United States, is not equally aquatic? The two species are obviously very closely allied. They resemble each other in appearance and their seeds are indistinguishable, which in itself is strong evidence of their relationship.

The statement that *I. aurea*, *ochroleuca* and *Monnieri* "will not tolerate real drought" seems to need some qualification, for these Irises undoubtedly flourish in Asia Minor and in other parts further east where the summer drought is more severe than anything that ever occurs in this country, for it is accompanied by heat greater than any we get. The truth probably is that these Irises, in a strong, fertile loam, will stand any amount of drought when once the flowering season is over. No plant can thrive when drought prevails in the growing season

unless there is underground moisture; but there is little doubt that all these Irises appreciate drought and heat to ripen their rhizomes after the flowering season. The leaves will then wither entirely away and the fresh shoots appear when rain comes in the autumn. An Iris which thrives with such treatment can hardly be said not to tolerate drought.

I. Monnieri, by the way, is almost certainly not a wild species but a garden plant, for seedlings

PURE WHITE PRIMULA SILVER STAR.

of it give much variation, the majority being forms of what we know as *I. ochroleuca*. The statement that the flowers of *Monnieri* are of a rich yellow margined with white is surely a mistake, for, as reference to Redouté's "Liliacæ" will show, the original plant and the one which is now in cultivation has flowers of a uniform lemon yellow without any white edge.

The statement that *I. Kämpferi* has been evolved from *I. laevigata* and *I. setosa* needs proof. It is perfectly true that both *I. Kämpferi* and *I. setosa* are natives of Japan and that in both of them the "falls" have tended to grow in size at the expense of the "standards"; but, beyond this, there is no known evidence that *I. setosa* has ever been crossed with *I. Kämpferi*. Among many hundreds of self-sown seedlings of *I. Kämpferi* nothing like *I. setosa* has ever been known to appear, and attempts to cross the two species have been so far unsuccessful. Moreover, *I. laevigata* and *I. Kämpferi* are two totally distinct species. They are both found, it is true, in the Amur district of Manchuria, but *Kämpferi* has leaves with a distinct midrib, while those of *laevigata* are quite smooth. *I. laevigata* has "standards" which are practically of the same length as the "falls," while those of *Kämpferi* are not much more than half as long. Still more obvious differences are to be found in the seed capsule and in the seeds themselves: the capsule

of *I. Kämpferi* is short and rounded and that of *I. laevigata* oblong in outline and triangular in section. The seeds, too, are totally unlike; those of *laevigata* being smooth and practically indistinguishable from those of *I. Pseudacorus* and *I. versicolor*, while those of *I. Kämpferi* are flat and surrounded with a kind of flange. The two species have often been confused; but anyone who has seen the red-purple *I. Kämpferi*, with its somewhat narrow leaves, growing alongside the rich blue flowers of *I. laevigata* must have seen at once that the two species are totally distinct. Negative evidence of failure is not worth much; but several attempts to cross the two species have produced no result and there appears to be no record of any trace of the real *I. laevigata* among seedlings raised from either Japanese or European specimens of *I. Kämpferi*. How the Japanese have evolved their hybrids from the single-flowered wild form of *I. Kämpferi* is not known; but probably, as in many other garden plants, these double forms have merely arisen in cultivation without any admixture from another species. The same explanation applies without a doubt to the Bearded Iris *Clematis*. Seedlings of *I. pallida* not infrequently appear with some or all of the "standards" changed in form, and there is even extant a paper by a learned Professor of Innsbrück who seeks to prove that this flat form of flower is the archetype of all Irises. His whole argument is based on an *I. pallida* identical in shape with the variety *I. Clematis*. Mr. Bliss was the raiser of *Clematis*, and he will probably support the statement that *I. Kämpferi* was in no way responsible for its shape. There is, in fact, no authenticated hybrid between a bearded and a beardless species of Iris.—W. R. DYKIS.

ON PUTTING PLANTS TOGETHER.

DOES "A Painter" still read *THE GARDEN*? If so, he may like the following idea: By the side of a drive a long, low retaining wall is topped by a broad planting of *Erica carnea*, at the back of which stretches a thick double line of Crocuses in three varieties—a rich warm purple, pale mauve and white striped, and pure white. I came upon this unexpectedly the other day when the sun was full upon it, and the effect was beautiful in the extreme. So attractive was it that I was glued to the gate for some time, and made a point of walking round that way daily while its beauty lasted. Such a pity there were no bees about to enjoy it!—(Mrs.) W. DUGGAN, Bournemouth.

THE MILD SEASON.

IN April, 1920, I remarked in the *Journal of Botany* that I had "no record of such precocious flowering during my residence in the West of England prior to 1889, nor again during the past six years." Although the third week in March this year has been cold in Bristol, vegetation seems about as advanced as in 1920. To-day (March 18) a *Laburnum* is showing its racemes of flower-buds, yet quite short, and two variegated Laurels (*Aucuba*) are in full bloom. In both cases the *Aucuba* bushes had apparently been much pruned, and the leaves are short and but slightly variegated with yellow. A small Lime tree at Clifton is just opening its leaves, some of which are 1 in. long. The same tree on March 20, 1920, was "green with leaves already 1½ ins. across." As then, Limes immediately adjoining, and others elsewhere, have not burst their leaf-buds at all. A Mountain Ash (*Pyrus Aucuparia*) to-day has leaves of 4 ins. and clusters of buds 2 ins. high. On March 21, 1920, it had leaves 5 ins. in size. An old Horse Chestnut below Clifton Parish Church is a little more forward than on

March 7, 1918, when "some of the young green shoots were about 4 ins. across" (*THE GARDEN*, March 23, 1918). To-day many of the leaves are partly expanded, though other Horse Chestnuts close by show no sign of it. Can any explanation be given for the persistent precociousness of certain individual trees and other plants not specially favoured by situation?—H. S. THOMPSON.

A FINE ALOE.

AMONG the many species and varieties of the flowering Aloes there is none, I think, more worthy of general cultivation than *A. spinosissima*. It deserves attention from gardeners in general, as it is dwarf in habit and has long and brilliant spikes of light red flowers in the end of February. Evidently it increases very rapidly by offsets. Being stemless and dwarf in growth, it seems to me well suited for pot culture where it could not be grown out of doors. It would take up no more room than a well grown *Cineraria*, and would give a note of distinction to any cold greenhouse. It is, of course, a child of the sun, and needs all the sun and air that it can get in northern regions,

A LITTLE CLUMP OF *VIOLA GRACILIS*.

but in summer left to itself outside under a sunny wall it would need little or no attention in the matter of watering, and would, I think, mature its growths sufficiently to produce its handsome spikes of flower. I have only seen it in quantity in such gardens as La Mortola or that of the Prince of Monaco, and I do not know if it is in the hands of nurserymen, but it certainly is a plant to cultivate on the Riviera, where it needs no attention when once planted in a sunny spot, unless it be some winter when a sudden storm of snow falls as it can sometimes do on this coast, and then it is only the flower-spikes that would need protection. There are several varieties, and perhaps that which is termed *cyanea* is the finest and biggest, but the difference in any case is small. They make a specially good effect when grouped with the massive stemmed forms of Aloe, such as *A. Salm-Dyckiana* and others, which flower a little later in the winter, prolonging the season of brilliant tritoma-like flower-spikes for six weeks or more. Thus grouped they are the admiration of all who behold them.—E. H. W.

AN ALPINE PANSY.

I WAS interested to see the note by S. J. S. on *Viola calcarata* and I agree that in some of its best forms *V. calcarata* is worthy of extended culture, but I do not like the rather disparaging way in which he speaks of *Viola gracilis*. I am by no means sure that this is not my favourite alpine. When we get forms of *V. calcarata* which will give masses of such glorious colouring as *V. gracilis* affords, it will no doubt become equally popular! Personally I do not think *V. gracilis* a bit over-rated. If your correspondent had attacked *Viola cornuta* now,—but that is another story.—ALPINIST.

A VALUABLE ACHILLEA.

ACHILLEA LEWISII is a charming hybrid Achillea that has for some reason or other got about under two names, viz., *A. Lewisii* and *A. King Edward*. There seems, however, little doubt that *Lewisii* is the correct name by right of priority. The plant is a spontaneous hybrid between *Achillea rupestris* and *A. tomentosa*, and was discovered in 1908 by Mr. Ingwersen, and was then named by him in honour of Mr.

Lewis, in a gravel path in whose garden it had sprung up self-sown. The two parents were growing close together, leaving no doubt as to the hybrid origin of the seedling. The flattish heads of flowers are pale sulphur in colour, and the plant spreads into tidy mats of ash grey foliage. It is a free grower without ever becoming a pest, and since we have had it at Stevenage it has seldom, if ever, been out of flower. This continuous flowering is a very valuable trait in the plant's character. It seems to thrive in any reasonably decent soil, and prefers fullest sunshine. In height it is about 4 ins. or 5 ins. Last year I hit upon a very happy companion for *Achillea Lewisii*. This was *Campanula pusilla* Miss Willmott. In planting a rock garden I put a mixed broken drift of the two plants. The colour contrast of lavender blue and sulphur yellow was delightful, and they lived happily together without mutual strangulation. The same beautiful effect of lavender blue and sulphur may be obtained earlier in the year by planting *Alyssum saxatile citrinum* and *Anubrieta* Lavender near one another.—CLARENCE ELLIOTT.

ROSES UNDER GLASS

A Use for Cold Houses.

NOT a few imposing palatial glass structures—regarded as more ornamental than useful even before war worries cut down, or off, the coal bill from garden expenses, in perennially poaching on the plainer but more practical plant preserves to keep them furnished—might now not inaptly bear the legend “Ichabod” (Their glory hath departed). Of two such houses in the gardens of Roebuck Castle, Dundrum, the town of the fort on the ridge, on the southern side of the Milesian metropolis in the pleasantly situated demesne of Mr. Francis V. Westby, D.L., one, best suited to the purpose, has been happily converted into a rose-house embracing a good collection of well grown pot plants.

The Roebuck Castle rose-house, an imposing curvilinear iron-ribbed building erected in happier Victorian days and, one might say, judging by elaborate internal fittings, regardless of expense, is not adapted to the planting out of climbing varieties as is the roomier and more imposing conservatory standing in the pleasure grounds of Luttrellstown Castle, the ancestral home of the lately deceased Lord Annaly, at the other end of the County Dublin. This house, originally the section of an exhibition building purchased by the late Lord Annaly's father full fifty years ago, was long, under the then changed conditions Irish landlords seem heir to, looked on as a white elephant and a heavy tax on the garden economy in providing it with provender in the way of putty and paint.

An old friend, however, in his then new charge of Luttrellstown Gardens, under changed conditions of having to make them pay, while forcibly stating that he “couldn't think what possessed the old lord to put up such a useless structure,” soon discovered its usefulness. Heating arrangements were at that time derelict, but by a liberal planting of climbing Tea Roses trained up the lofty vertical sides (it was glass to the ground) he was able, under his manipulation, to cut many baskets of blooms from late spring pretty well on to Christmas, which were appreciated to the extent of good prices in the Dublin market, and thus the “useless” house contributed its quota to the credit side of the garden account. The particular manipulation referred to was that the foreman whose duty it was to cut the blooms was grounded into the practice of pruning as he cut, by removing any superfluous weak growth, and, further, cutting back the shorn flowering wood to a couple of eyes, to the end of pretty well perennial pruning and perpetual flowering going hand in hand.

GOOD ROOF CLIMBERS.—Two rather remarkable roof climbers in the Luttrellstown conservatory appear worth noting, as both contributed to the demand for cut flowers. The one, *Clematis indivisa lobata*, provided crops of pearly white blooms much sought for by the florists; the other, *Stauntonia latifolia* (thus called, probably hexaphylla), was appreciated for its exquisite perfume. Both, as there treated, and as seen there, were remarkably clean, healthy growers. The *Stauntonia* seemed especially a lady's flower and gave much delight to the young Princesses of Connaught at the time their father, the Duke, was resident in Dublin as Commander of the Forces, when they visited the Hon. Mrs. Barton, then tenant of the Castle, because it “smelt like grandmother's handkerchiefs.” Grandmother, of course, was Queen Victoria, who honoured Mrs. Barton with a visit too.

Back to the Cotswolds and early days, and the palm for Tea Roses under glass is ungrudgingly

given to “Old Jarge,” “T' Pa'ason's” gardener in that old-fashioned rectory garden on the Cotswold Hills. The “grinhus” was to all intents and purposes a rose-house, climbing varieties, among which “Glory de John” loomed large, practically covering all roof space. It seemed a case of singleness of purpose accomplishing more than a plurality of talent, for the worthy Rector, whose tastes for following the hounds little pleased the proletariat of the parish prone to stray into the “Methody” fold, leaving him with but few of the faithful to care for, took a liberal share in gardening generally to the end of taking credit for success or blame for failure, but in the “grinhus” “Old Jarge” was *aut Caesar aut nullus*.

DIGRESSING AND REMINISCING.—Certainly as “sextant” “Old Jarge” was invested with a

them into half-standards potted up for “t' grinhus.” Could one ever forget those glorious canary-coloured, oval-shaped blooms never seen equalled since, compared with which the now rarely seen *Maréchal* of latter days is of decidedly degraded rank. No! for the exquisite perfume comes wafted back over long years. “Old Jarge” and his Roses were talked of from “Cisester” (Cirencester) to Cheltenham.

But there came times when good relations ‘twixt garden (or rather “grinhus”) and house were strained almost to breaking point. Those were the “feeding times” when “Jarge,” after soaking the border with rain water from the cistern, followed it up by many buckets of nourishing liquid from the sewage tank, and all the rectory windows on the windward side were kept religiously closed. Another critical period was when “Jarge” “smoked t' grinhus,” and the same exclusive method was perforce repeated by the maids. “Zeed old Jarge a scratching himself

ONE OF THE BEST GREENHOUSE ROSES—OPHELIA.

certain amount of ecclesiastical dignity, the more especially as, by the keener critics of his master's theology, he was credited with (or accused of) having a hand in concocting the Sunday sermon. This he did not affirm, yet it was rather suspicious that he never denied it; but there may have been less truth in that than in the report that on a certain Sunday morning only the twain turned up for the service, and when “T' Pa'ason” mounted to the top storey of the shaky old three-decker pulpit, “Jarge,” handing up the ponderous church key, asked him to “lock up when he'd done, there being no use in his a'waiting.” That happened prior to my migration to the Cotswolds in 1873, for the minimum congregation personally experienced (including myself) was seven.

“You may break, you may shatter, the vase as you will, but the scent of the Roses will hang round it still,” and fragrant memories gratefully crop up of “Old Jarge's” Roses. He lived with them and for them a long and happy life. That was the time when the brave old *Maréchal Niel* was in the heyday of youth and beauty, and “Jarge,” who managed to secure buds from “T' Squire's” garden (Squire Elwes of Colesborne, father of the late Mr. H. J. Elwes) soon converted

in t' grinhus this marning” was the sure and certain sign that he had seen signs of green fly, his *bête vert*, on his beloved, and weather permitting, fumigation would follow that evening. So much in sympathy was the old man with the objects of his love and care that was there any signs of their discomfort he was telepathically uncomfortable too. But, as Dean Hole would have said, he had Roses in his heart. K. DUBLIN.

PRIMULA SIEBOLDII

FOR a shaded, rather moist position in the rock garden or on the bank of a small stream this, in April and May, forms a particularly attractive picture. In colour it varies considerably, from white to lilac and several shades of rose pink, the white varieties being especially striking. It is easily raised from seed and luxuriates in a soil in which leaf-mould bulks largely. It is advisable to provide a top-dressing of this annually each spring after the leaves are well up. A point that should be noted is to label their position, clearly and conspicuously, as the foliage dies down in winter and, when tidying up, they are apt to be overlooked and destroyed.

GARDENING OF THE WEEK

FOR SOUTHERN GARDENS.

The Hardy Fruit Garden.

Black Currants.—In many districts these bushes are badly infested with the gall mite, which causes what is commonly known as big bud and, unfortunately, no variety is immune from attack. Only persistent treatment of the bushes will keep it in check, and so far as old specimens are concerned it is better to grub them up and plant, on a fresh site, such as Boskoop Giant or some other strong, vigorous kind. The black currant mite should be dealt with from April to June. The "big bud" on those attacked are easily recognised, and they should be picked off by hand and burnt at once. Afterwards thoroughly spray the bushes and repeat the application every ten days until June. A useful spray is made up of soft soap 2ozs. and quassia extract 4ozs. to every gallon of soft water. With the currant gall-mite, grease makes a good spray earlier in the season. The bushes may also be dusted with lime and sulphur when the branches are moist with the dew, employing one part of the lime to two parts of sulphur. These should be well mixed and applied at intervals as recommended for the spraying. Personally, I have found the quassia mixture most effective.

Fruit Under Glass.

Melons.—Although Melons are usually grown in low houses, there is no reason why the person with a cold frame should not enjoy a few fruits also. Now is a good time to collect material, such as leaves and stable litter, for the formation of a hot-bed. The position chosen should be an open one, where the sun will reach the frame during the greater part of the day. When the rank heat of the bed has passed off and the mounds of soil are thoroughly warmed, the young plants should be placed in position, two being ample for each light. For a week or so it may be necessary to leave a little air on throughout the night to allow any rank steam to escape. If the nights are cold, mats should be placed on the lights, removing them in the morning when the outside temperature begins to rise.

The Melon-House.—Here it will be an easy matter to keep up the temperature, and the atmosphere must be kept moist by damping the floors and syringing the plants twice daily. The roots should be kept well supplied with water, and plants swelling their fruits will be benefited by applications of weak liquid manure. The water should always be tepid, whether employed for watering or spraying.

The Kitchen Garden.

Asparagus.—Where new beds are required, now is the best time to make them. While admitting that an Asparagus-bed should be well made, there is really no necessity to go to a lot of expense in its preparation. A deep rich loam or any good garden soil will suit Asparagus, and having pegged out the bed 4ft. wide it should be well trenched, incorporating a liberal quantity of manure as the operation proceeds. An alley of 2ft. is needed between the beds, and the best of the soil from the paths may be placed on the beds. When the soil has settled the Asparagus roots should be planted about 18ins. apart. Care must be taken to prevent the roots getting dry, or they will suffer in consequence. No "grass" ought to be cut from these beds until the plants are well established. If the grower can afford to wait, seed may be sown in lines 18ins. apart and three or four seeds placed at intervals of 15ins. When the young plants are a few inches high thinning must be done, leaving the best plant of each grouplet. Established beds must be kept free from weeds and receive a dressing of soot. A liberal sprinkling of agricultural salt is also recommended a fortnight hence, the application being repeated in another three weeks. This not only stimulates the plants but discourages the growth of weeds.

Cauliflowers.—Plants raised from seed early in the year may be planted out when the weather is warm and showery. Keep the hoe at work, and thus encourage the plants to make rapid growth.

The Flower Garden.

Violets. When the plants growing in cold frames have been hardened, the necessary runners should be taken and transferred to their summer quarters. A partially shaded border is ideal for Violets, and if the soil is rich and has been well prepared by deep digging, strong, healthy plants will be the result. As a rule there are plenty of runners or side growths with roots attached, and these should be planted in lines

15ins. apart and 10ins. between the plants. If the stock of any variety is scarce, the growths without roots may be placed in a cold frame similar to cuttings, and if they are syringed occasionally roots will form readily. If the weather proves dry, water will be needed until the plantlets are established. During the summer months a watch must be kept for red spider; but with a free use of the syringe and an occasional dusting of soot this pest is not very troublesome.

Dahlias.—It is time the tubers were removed from their resting quarters and placed in boxes containing a little leaf-soil. Sprinkle more soil among the tubers and place them in a cool greenhouse, where they will form short-jointed and sturdy growth. The stock of special varieties may be increased by splitting up the roots when the shoots are sufficiently advanced.

T. W. BRISCOE.
(Gardener to W. R. Lysaght, Esq.).

Castleford, Chepstow, Gloucestershire.

FOR NORTHERN GARDENS.

The Kitchen Garden.

Onions which were sown under glass in January should now be planted out in well enriched, deeply dug ground. Stretch the garden line and plant to it either with trowel or dibble, allowing 6ins. between the plants and 12ins. to 15ins. between the lines. See that the roots are inserted their full length and the bulb just resting on the surface of the soil. Unless the soil is extra heavy, it should be trodden firm with the feet and raked smooth before commencing to plant.

Broad Beans.—Another sowing for succession should now be made in rows 2½ft. apart, placing the seeds about 8ins. apart in the row. Bunyard's Exhibition and Seville Longpod are two excellent varieties.

Turnips.—A small sowing may now be made on a south border for early use. Sow in very shallow drills from 12ins. to 14ins. apart. Early Milan matures quickly. I prefer the White Early Milan as having less bitterness than the type.

Lettuce.—A full sowing should now be made; the Cabbage type is more useful than the Cos, Neapolitan, Tennis Ball and All the Year Round are all excellent varieties. Sow in rows 9ins. or 10ins. apart.

Celery.—As soon as the seedlings are large enough to handle prick them out in frames in fairly rich soil that has been passed through a half-inch sieve. It will be an advantage if a foot or more of rank manure or other open material is placed in the bottom of the frame, thereby raising the temperature of the soil. Allow about 4ins. between the seedlings. Shade for a day or two with the frame close, then gradually inure to light and air. All these little attentions tell on the future welfare of the plants.

Fruit Under Glass.

The Early Vinery.—As soon as the berries have attained the size of an average Black Currant the work of second thinning should be taken in hand, directing special attention to the centre of the bunches and to the removal of any berries whose footstalks may have been injured during the first thinning. Slightly tie up any "shoulders" of considerable size which were previously overlooked. The berries removed at this thinning, if collected and washed, may be used in the kitchen for tarts. Examine the border (by means of an auger if in doubt), and if dry, give it a good soaking, as the lack of moisture at the roots will militate against the welfare of the Vines generally and against the swelling of the fruit in particular.

Strawberries.—Withhold stimulants from plants whose fruits are showing colour, and expose the fruits as fully as possible to the sun's rays. Where there is a succession batch swelling its fruits, moderately strong stimulants should be applied twice a week. Do not on any account allow the plants to suffer from lack of water; in fact, from now onwards the pots may be stood in saucers, which will conserve the drainings from the pots.

The Hardy Fruit Garden.

Side Grafting.—This form of grafting is suitable for filling up gaps on a tree or for grafting a superior variety on to an inferior one. Now is the time for performing this operation when the sap is ascending. An incision is made in the bark of the stock, and the scion, being neatly prepared as for splice grafting, is inserted into the incision as in budding and then covered with grafting wax or clay.

The Flower Garden.

Hollyhocks.—These stately plants are less popular now than they were, but they still have their use as background plants. They may now be planted from nursery lines in rich, deeply worked soil, as these plants are gross feeders.

Sweet Violets.—Rooted runners should now be taken from plants in frames and planted about 1ft. apart on a cool border which has been well manured and deeply dug. As the young plants develop, all runners or side growths should be promptly removed as they appear, as it is only thus that vigorous plants can be obtained for frame culture next season. As soon as the parent plants have finished flowering they should be thrown away.

Antirrhinums.—Autumn-sown plants and those which were raised from cuttings in the autumn should now be planted out. The Antirrhinum should not be too liberally treated, in proof of which see the goodly specimens growing in the crevices of an old stone wall. Spring-raised seedlings, which are most in vogue, should be well exposed now, preparatory to being planted out; meanwhile see that the ground is in readiness for their reception.

Lawns now demand close attention. They must be mown once a week at least, and playing lawns twice a week. The same remark applies to rolling. The broom must also be brought into operation if the mower is not furnished with a grass box.

CHARLES COMFORT

(Formerly Head-gardener to Mrs. Haig, Broomfield, Davidson's Mains, Midlothian).

GREENHOUSE AND CONSERVATORY.

Humea elegans, commonly known as the Incense Plant, is not often seen in gardens at the present day. It has generally been regarded as a somewhat difficult plant to manage, but I have not experienced any difficulty with it. It is, undoubtedly, troublesome when given its final potting, and at this stage an unskilful cultivator may kill every plant by an overdose of water. *Humea elegans* requires careful watering at all times, also, cool, airy conditions. Plants raised from seed sown last July or August should now be ready for their final potting, which if they have been well grown should be into 8in. or 10in. pots containing plenty of drainage material. The compost should consist of good mellow loam with the addition of some leaf-soil or old mushroom-bed manure and enough clean coarse sand to keep the whole open and porous. Pot the plants moderately firm and water very carefully until the roots have got a good hold of the fresh compost. *Humea elegans* is sometimes attacked by aphids, and as this plant is very impatient of fumigations and insecticides, it is well to keep a sharp lookout and brush the pests off as they appear. Here I think I should state that this plant produces a rash or eczema on some persons in the same way as *Primula obconica*.

Lobelia Tenuior.—Earlier-sown batches of this beautiful plant should be potted on as they require it. If large specimens are desired, three plants are best grown in a pot, and they may be pinched once or twice to induce a bushy habit. As they increase in height some sprays of Hazel should be used to support them. A pinch of seed should be sown at this time to maintain a succession of plants, as by so doing it is possible to have this *Lobelia* in flower until early winter. The ordinary dwarf *Lobelias* are also excellent for furnishing the fronts of the stages, and the different varieties come very true from seed, although it is usual to increase any good variety by means of cuttings, which root very readily during the spring months. The double varieties, which are excellent for pots, must, of course, be increased by means of cuttings. There are several long, straggling growers, such as *Sapphire*, which are excellent for small baskets, and these are best raised from seed.

Tecoma alata (syn. *T. Smithii*) is a good plant for autumn and winter flowering, and is easily propagated by means of cuttings at this time. By propagating at different times this plant may be had in flower over a considerable period. This plant grows quite well in any ordinary potting compost, potting on the rooted cuttings as they require it. Their final shift should be into 6in. pots. This plant requires quite cool treatment at all times, and during the summer may, with advantage, be stood outdoors on a bed of ashes. If fine large inflorescences are required, the plants should not be stopped; if more bushy examples are desired, the young plants should be pinched

LARGE BAG 7/- only; CARRIAGE PAID TO YOUR DOOR

if within 25 Miles of London; beyond extra, as below.

WAKELEY BROS. & CO., Ltd., 75a, Bankside, London, S.E.1

EVERY DRESSING OF WAKELEY'S HOP MANURE enriches the soil with the Humus it contains, doing lasting good, quite unlike the ordinary chemical manures, which act only as stimulants, and which, by constant use, impoverish it.

KING'S ACRE

Hardy Herbaceous & Border PLANTS and VIOLAS for Spring Planting. A reliable and extensive stock of young, vigorous Plants.

Illustrated Catalogue and any information required free on request to

King's Acre Nurseries
HEREFORD, Ltd.

Of course you can have them!

Plants and fruit and vegetables only thrive when the soil is rich and nourishing. When the soil is poor, the flowers and plants are starved. You can't expect it to be otherwise. It's up to you. If you want rich blooms in profusion and plenteous crops of luscious fruit and juicy vegetables, you must see that the soil is fit to produce them. And of course you do want them. Then use ECLIPSE Fish Manure to enrich the soil.

ECLIPSE Fish Manure contains Phosphates, Nitrogen and Potash in their proper proportions. Being largely organic, it supplies humus to the soil.

You can't Dig a Garden—

with good intentions and a hairpin. There has to be some honest spade-work.

You can do your digging and weeding with anybody, but you have your little weakness like the rest of 'em! You like to *look* as though you'd done it. A little perspiration, and good honest dirt thick up to the elbow.

Well, and why not? Just walk about a little where the neighbours can see you, and then—KIT.

KIT soap will clear every atom of dirt, grease, oil, paint or tar out of your hand, and will do it nearly twice as quickly as anything else. It is a nice "spready" sort of soap, so you need only a little. The tin is blue and orange (the handy shape and the handy size), and the lid comes off just when you want it.

Keep a tin in the house for cleaning after "odd jobs."

Price 6d. per Tin.

KIT the speed soap

once, which will induce several shoots to develop. The cultivation of this plant presents no difficulty, but whenever the flower-buds shew at the ends of the shoots all lateral growths which at this time appear below the flowers should be rubbed off, as such laterals soon take the lead, with the result that the flower-buds are suppressed and fall off.

Rhododendrons.—There are quite a number of fine greenhouse Rhododendrons which are worthy of more general cultivation, as they are excellent for planting out in cool conservatories and also make fine specimens in large pots or tubs. Many of them, such as Lady Alice Fitzwilliam, are hybrids of *R. Edgeworthii*, and from this species they derive their delicious fragrance. *R. Fosterianum* is one of the best, with large white flowers with a yellow blotch at the base and sometimes slightly tinted with pink. Most of these Rhododendrons are easily propagated at this time by means of cuttings, using medium

sized, half-ripened shoots for this purpose. Insert the cuttings in pots containing sandy peat, and plunge them in a propagating-case with slight bottom-heat. Lady Alice Fitzwilliam usually sets seed so freely that the plants suffer severely if the capsules are not picked off. The seed, however, affords a ready means of increase, the resulting plants shewing very little, if any, variation. *R. Veitchianum* is a very beautiful species which is readily raised from seed. Any of these Rhododendrons that may prove difficult to propagate by means of cuttings can readily be grafted on stocks of *R. formosanum*, side grafting being the best method to adopt. Many of these hybrid greenhouse Rhododendrons make long, straggling growths, but as they can easily be bent in any direction they can readily be trained round supporting stakes, and if they are bent down it induces the back buds to start into growth and thus helps to keep the plants well furnished.

Royal Botanic Gardens, Kew. J. COULTS.

ABOUT OVERCROWDING

IT is possible that overcrowding is responsible for more failures in the garden than any other mistake. We begin with sowing seeds too thickly, especially indoors, so that as soon as germination has taken place the little plantlets touch one another, and then neither air nor light can reach them in sufficient quantity.

Just remember the difference you may have observed when sowing Lettuce seed in a row in the open air. If two or three seeds happen to be dropped outside the line, compare results as regards health and vigour with those you have taken so much care of. There will be no visible stem to the accidental outcasts, and whether transplanted or left where they are, they will almost certainly produce better results than the thickly sown yet carefully tended ones. The latter, though they may be pricked off early, will have already formed weakly stems, and though these may be buried by transplanting, they will have lost some of their inherent potency and be more likely to run to seed prematurely than the more naturally grown ones, especially if there should be a shortage of water. When sown indoors they are more likely to be sown thickly and become still more drawn. I mention Lettuces, as these, though being among the easiest things to grow, will quickly shew the effects of unskilful treatment.

Then take the case of Peas, which we generally see sown much too thickly, the result being puny stems which seldom branch out, and by the time the first few pods are gathered the leaves at the base begin to turn yellow from starvation and suffocation. There may be more than enough plant food in the soil, but that will count for nothing without sufficient light and air. Peas will live a long time without manure, supposing there is sufficient moisture at the roots, but a deficiency of air to either root or leaf will speedily leave its mark. Vigorous-growing Marrowfat peas never ought to be nearer than 3 ins. apart, and it is best to sow a double row zigzag. When remonstrating with my vegetable man for wasting seed, he said, "Mice like Peas, master." But if Peas are properly dressed before sowing with red lead or paraffin, the mice, and birds too, will go elsewhere for their breakfast. That the distance mentioned is not too great is proved by the fact that seeds raised in boxes and planted 6 ins. apart are found to be quite close enough. It is not only that the plants hold out longer when given sufficient room for both leaves and roots, but the quality of the produce is greatly improved.

Those who grow Sweet Peas for exhibition will know the value of a little extra space, and we should take a lesson from them, for perfect flowers

are as necessary for culinary Peas as for the ornamental varieties.

Runner Beans, perhaps more than any vegetable, require ample room for development. Where the means are at hand I prefer sowing these indoors in March singly in 5 in. pots half filled with soil at first and afterwards top-dressed. The plants, if stopped twice, will form good-sized bushes, and may be planted 18 ins. apart in a row or, what is better, singly in deep basins 2 ft. or 4 ft. apart each way. They can be frequent stopping easily be kept down to 5 ft., and I have found that stopping the rambling shoots makes them no later in bearing. I have on several occasions gathered Beans by Midsummer Day from plants so treated, and some of the pods were produced very near the ground. Should there be a necessity for watering, this can be done thoroughly, for the basins should be capable of holding a couple of gallons. Dribblers are very harmful, therefore if one must apply water, it should be done thoroughly, and it is surprising how much water they will take in hot, dry weather, when the flowers are likely to fall off. Remember, the roots will not be confined to the basins in which they are planted; they will ramble laterally through the spaces between, and water poured into the basins will, if sufficient in quantity, percolate under the surface to these rambling roots. Bear in mind also that roots have the power of sucking moisture from soil which is beyond their extremities. Many people pour water just round the stem of a plant. This may satisfy the operator, but it is far from satisfying the plant.

To digress for a moment, I may say I have found a good heavy syringing during the middle of a hot summer day useful to prevent flowers dropping and also to assist fertilisation. A slight spraying would be injurious, as it would cause what is called "scalding," but which I call "chilling," produced by rapid evaporation. Not only should the plants be drenched, but the surrounding soil should be well damped. This will have the effect of lowering the temperature, checking transpiration, and vapour will be produced, which, though invisible, will perhaps suffice to produce a little shade temporarily.

If one cannot sow singly in pots, seeds may be sown in a box during April and transplanted when they have made a leaf or two beyond the seed leaf. The box may be kept in the dark till germination has taken place and afterwards placed outside and covered when necessary. During this interval the outside soil will probably be getting warmed somewhat. I have known this plan successfully practised by cottagers.

I wish I could persuade all cottagers to treat their Runner Beans more rationally. It is a very

important vegetable to them, yet unless the summer happens to be cold or wet, they seldom gather many Beans before September, and these are borne only in the upper portion of the stems. If sown 5 ins. apart a better crop is produced than when less space is given. T.

ON DESIGNING A GARDEN

(Continued from page 165.)

ANOTHER reason for having gardens as widely contrasting in character as space will allow—and it is wonderful how much may be done in a small space if everything is kept to scale—is that one can grow all, or nearly all, of the hosts of different plants as they should be grown in their proper places. Herbaceous plants, annuals and biennials will be planted in the more formal gardens, Roses, of course, in the rose garden, and the smaller-growing trees and most of the shrubs in the more natural parts of the grounds. Do not make the mistake of mixing Roses with other things, they are essentially plants to be grown by themselves. As in many other races of plants, there is a harmony in their colouring that, like the Scottish clanish feeling, is for members of the family alone. There are, however, exceptions to this rule, as to most others. Numbers of the Rose species, such as *Moyesii*, *rubrifolia* and several others can be used most effectively in shrubberies, on banks and in many places other than in the rose garden.

With the significance that the appearance of most shrubberies gives to it, the word "shrubbery" is a detestable one. The shrubbery walks and gardens in which, as well as shrubs, many of the smaller trees will be included, should be some of the most naturally beautiful parts of any garden. The bright colours of their flowers in spring and early summer, the variety of choice they offer for any soil and situation and, above all, the beauty of form of many of them, lend themselves in their successful planting to the making of some of the loveliest of garden scenes. The Japanese have the reputation for being supreme in the art of landscape gardening, but our English taste, a taste that is the product of long cultivation, likes, at any rate in its gardens, something that is English in feeling. With the more beautiful shrubs and trees, and it may be a few masses of the straggler-growing herbaceous plants and here and there a great boulder of stone, an artist can make gardens every line of which is a joy to look upon.

To make this sort of garden to perfection the lawns should be more or less hollowed towards their centres, and the sectional curvature continued in a more pronounced degree by the borders and planting. It is a kind of planting none but one who is, at any rate, something of an artist had better try to arrange, for to see the most beautiful of shrubs grouping themselves in squares and rectangles, as I have seen them do under the supervision of really skilled gardeners, is something to be avoided. For this kind of garden, shrubs should be chosen as much for the beauty of their habit of growth as for their flowers, for in form such planting as this is always lovely, whether the shrubs be in flower or not. Never admit a Laurel; these plants are excellent for game coverts and are occasionally suitable as hedges, but they are not for the position we have in mind. Shrubs may be divided roughly into two classes, those of beautiful habit of growth, whether in flower or not, and those that are planted principally for

the display they give during their season of flowering.

Among the former may be included almost all the Barberries, *Berberis stenophylla* and its various hybrids, *B.B. Gagnepaulii*, *Darwinii* and *Thunbergii*, the lovely dwarf-growing *Berberis Wilsonae*, and both the green and purple forms of the common Barberry, *Berberis vulgaris*. The shrubby *Spiræas* also offer some beautiful forms of flowering shrubs, *Spiræa arguta*, *S.S. discolor* (*aristifolia*), *Lindleyana*, *confusa* and *prunifolia* fl. pl. being some of the best. Thorns, *Laburnums*, *Lilacs*, Japanese Maples (in sheltered spots), Brooms and Gorse, *Cistus*, *Lonicera* and many others offer a wealth of material from which to choose.

There are too many interesting and beautiful shrubs to attempt to enumerate them in the space of a short article. Be sure, however, to include some both of the upright and prostrate-growing Junipers. The grey-green colour of their foliage as well as their beautiful habit of growth makes of them some of the most useful plants we have. Also utilise cypresses and other evergreens in any planting of shrubs; they add weight, and in winter, will intensify the beautiful tracery of the branches of the deciduous trees and shrubs by the contrast with their own persistent green foliage.

It is difficult to make an informal treatment look really well in a small space. Carving lines in a garden need length and a setting of trees and shrubs.

PERCY S. CANE.

"THE SQUIRE, THE GARDENER AND THE COOK"

A DIALOGUE ABOUT VEGETABLES.

THE SQUIRE: Your kindly reception of my suggestions, Paxton, has given me a great deal of pleasure, and I now take such an interest in the garden as I should not have thought possible. I am beginning to think Disraeli was unfortunate in his gardener acquaintances according to his estimate of them in "Lothair." I may say now that I have one or two compliments to pay you. A friend tells me he detests Cabbages, that they are indigestible and have no taste, unless it is a very disagreeable strong one, that they are only fit for pigs. They are not fit for cows, as they spoil the flavour of the butter. Well, now, the Cabbages you sent in last spring were delicious, and the cook tells me they only require from twenty to thirty minutes' boiling, and that they retain their fresh green colour without soda being added to the water. Sometimes in former situations she has had to boil these vegetables twice or three that length of time, and although soda was added, the colour of them when dished up was not attractive. What is the reason? Is it a particular variety you grow?

PAXTON: No, sir, it is not the variety; it is the culture and the cooking. They are planted in very rich soil, in shallow drills 2ft. apart and 1ft. apart in the row. As soon as they commence to grow freely in February a little stimulant is given in the shape of "nitrate," and the soil is pulled close to the stems with a hoe. This operation is repeated with the feeding in March, and at no time is any bare stem left visible. They very soon show that they like this attention. Many people plant them rans, apart on level ground, and this distance gives no room for earthing up without injuring the roots. If the situation is an exposed one, you may see them swaying about with the wind and making a plastered hole the size of an eggcup. The number of plants in a given space is about the same either way. Then, again, they are sometimes planted by the edges

of walks to economise space, but this does not bring either quality or early development. As to cooking, you are fortunate in having a cook who does not always follow her grandmother's practice. After one trial she knows the time it takes to cook a green vegetable, and the lid is never once lifted till the vegetable is ready to take up. The more steam there is confined the better. Any ordinary saucepan will allow more than enough to escape. If you would fit an adjustable sieve inside the lid in order to keep the green vegetables under water, the thing would be perfect. Any leaf above the water turns brown, just as badly as it will do in a steaming apparatus. Cabbages should be quickly grown, quickly used after gathering and quickly cooked.

THE SQUIRE: Your explanation interests me exceedingly. I have lately read much about what scientists call "vitamines," which I do not clearly understand, but as there seems to be a general agreement among learned men that these are very valuable constituents of our food, there must be something in it. They also tell us that the longer vegetables are boiled the greater is the loss of these vitamins. So you see, whether you know it or not, you and the cook are acting on the side of the scientists. Then as to Carrots. I had no idea till last spring that I liked these roots as a vegetable. They had previously only been used for flavouring, but those little stumpy ones, about the size and length of one's thumb, were very much relished, and I am told that these, too, were only boiled half an hour and were neither peeled nor scraped. Why cannot you supply these all through the summer and autumn?

PAXTON: Oh! yes, sir, I can supply them, as you like them so well, by sowing every month from March to the first week in August, and the last two sowings will keep up the supply through the winter and early spring. They will not be so good in the spring when the roots start growing afresh and will take longer to cook, but they will be young Carrots and can always be pulled fresh from the ground with their leaves quite green. When Carrots need boiling a long time there is more flavour in the water than in the roots. The variety I prefer is Early Nantes, and I wish those who grow for seed would take more care to preserve the true stock instead of devoting so much attention to reputed improvements.

THE SQUIRE: The cook tells me the Runner Beans you send in require no stringing and that they are quickly cooked. Is it a stringless variety?

PAXTON: No, sir, it is only a question of gathering at the right time, which is before one can see much of the shape of the seeds.

THE SQUIRE: I am informed that large Parsnips are the best, there being comparatively less core, and the core being of inferior quality need not be used; but I wish you would grow some smaller Onions. You may take pride in producing bulbs 3lb. in weight while your neighbour's only reach 2½lb., but they are wasteful in the kitchen.

PAXTON: I will attend to your wishes, sir, and am glad to have pleased you in some other matters.

THE SQUIRE (musing): What Heaven-sent blessings! A competent gardener and a competent cook, neither being too concerned to attend to my whims. Truly, knowledge begets modesty. Who can gauge the power for promoting human health and happiness possessed by two such unassuming yet qualified persons acting in unison?

WM. TAYLOR.

The Great Ghent Show. There will be an important horticultural exhibition held in Ghent from April 14 to 22, which should prove of great interest. Those of our readers who would like

to visit this will be pleased to learn that the Southern Railway are issuing cheap week-end tickets from London to Ostend, via Dover, which will enable passengers not only to visit the exhibition, but to spend a few days on the Belgian coast. A point which is worth noting in this connexion is that for British subjects passports are entirely dispensed with, thus greatly facilitating the journey.

ANSWERS TO CORRESPONDENTS

FLOWER GARDEN.

TREATMENT OF NARCISSI ("Torquay").—If the foliage is allowed to ripen off naturally and healthily, the bulbs should continue to produce flowers satisfactorily year after year. The necessary weeding and cleaning should not be harmful to the plants. If the bulbs are lifted after flowering, this work must not be done till the foliage is properly matured. When dried, store the bulbs in paper bags till time for replanting, which ought to be early in September.

FRUIT GARDEN.

CUTTING STEMS OF WALNUT TREES ("Wood Dean").—The term "lud-bound" is used in some districts, and the cutting or slitting of the bark is occasionally done when the outer bark has contracted or hardened unduly, a callus forms along the cuts and the stem thickens. The condition occurs mainly owing to an unsuitable rooting medium and a check to the flow of sap resulting. In such circumstances it is generally the best course to take to destroy the trees and plant new ones in better positions.

ABOUT PLANTING FRUIT TREES ("Novice").—It is too late in the season to plant Apple and Pear trees. If they are planted now they will receive a severe check and produce very second-rate shoots during the summer. The better plan would be thoroughly to prepare the soil in readiness for planting, in our correspondent's district (Doncaster) the end of next November. We recommend cordons, bush and standard (the last, especially, if undercropping with Gooseberries is contemplated), and cordons for the production of extra fine fruits. The following are good varieties: Cox's Orange Pippin, Ellison's Orange, James Grieve, Warner's King, Golden Spire, Worcester Pearmain, Lane's Prince Albert, Bismarck, Alfriston, Newton Wonder and Bramley's Seedling. Pears: Williams' Bon Chrétien, Durondeau, Doyenné du Comice, Pitmaston Duchess, Beurré de Capiaumont, Marie Louise, Louise Bonne de Jersey, Beurré Hardy and Josephine de Malines. Approximate distance apart to plant. Standards, 15ft. to 24ft. for medium and 24ft. to 30ft. for strong-growing varieties. Bushes, 12ft. to 15ft. apart.

KITCHEN GARDEN.

GREENS ATTACKED ("Torquay").—The plants are attacked by the fungus *Peronospora parasitica*, one of the "false mildews." It is too late to do much to counteract this attack, but young plants should be sprayed with Bordeaux mixture and every care should be taken that the diseased foliage, etc., should not be allowed to get into the soil.

VEGETABLES UNDER GLASS.

CUCUMBER SEEDS NOT GERMINATING (A Regular Reader).—Without knowing the exact treatment of the seeds after potting we are unable to tell our correspondent the cause of failure. However, judging from the sample of seeds sent for examination, we think it likely that excessive moisture in the soil and the comparative coldness of the latter are the two principal reasons for non-success. Sixty-five degrees bottom-heat should, with very moderate soil moisture, cause successful germination. The seeds contain ample pulp, which has rotted instead of forming the two seed leaves normally.

MISCELLANEOUS.

GROWING MUSHROOMS IN BOXES (A. M., Surrey).—Proper materials and position are necessary if Mushrooms are to be grown successfully. The best positions are dark sheds, cellars and under stages in a greenhouse, all free from cold draughts. The necessary materials are horse manure from which the bulk of straw has been taken and the droppings treated so as to get rid of the rank gases, sweet maiden loam for covering bed 2ins. thick, and a final covering of clean straw 1ft. deep. The nick loam taken from immediately under the peeled-off turf should be used in boxes and made moderately firm. The bricks of spawn should be broken each into twelve pieces and inserted 6ins. apart 2ins. below the surface. Avoid applying much water but maintain a moist atmosphere round each box. Failures often occur where conditions are uncongenial.

INSECT PESTS (A. E. M.).—The black fungus on the leaves is not in itself very harmful. It grows upon the honeydew secreted by green flies and scale insects, and attention to the prompt destruction of these pests will prevent the occurrence of the fungus. The Roses have also been attacked by thrips, but the brown spots to which our correspondent refers are apparently due to lack of water at some time in the past or to injury through spraying at a wrong time or with too strong an insecticide. The Ferns have also been attacked by thrips.

Keep your garden produce 'fit' with COOPER'S PREPARATIONS

WEEDKILLERS.

WEEDICIDE

Highly Concentrated Weedkiller.
Commended by R.H.S.
1 gal. dilutes to 100 gal. water.
1 pt. tin 2/-, 1 qt. 3/3, ½ gal. 5/6, 1 gal. 9/-

1-50 WEEDKILLER.

Similar to Weedicide, but half the strength. 1 pt. tin 1/6, 1 qt. 2/9, ½ gal. 3/9, 1 gal. 6/6

SPRAY FLUIDS.

NICOTINE (V2) SUMMER FLUID.

For Arhis, Apple Sucker, Capsid Bug, Woolly Aphis, Scale Insects, etc.
1 gal. makes 100 gal. Spray Mixture.
½ pt. 2/-, 1 pt. 3/6, 1 qt. 5/6, ½ gal. 10/-, 1 gal. 15/-

A.S. FLUID.

For Arhis, Apple Sucker, and young scale Insects. 1 gal. makes 80 gal. Spray Mixture.
1 gal. 10/6, 5 gal. 42/6

ARSENATE OF LEAD PASTE.

For Leaf-eating Caterpillars, Codling Moth, Caterpillars and other chewing insects.

1 lb. 1/9, 2 lb. 3/4, 5 lb. 6/-, 10 lb. 15/3

FUNGICIDE.

An Improved Bordeaux Mixture for Pear and Apple Scab, Potato "Blight" and other fungoid diseases.

1 lb. tin 1/-, 5 lb. tin 3/6, 10 lb. 6/-

The "PERFECTOR" ARCH forms an ideal setting for the Rose Garden. The man whose pride is in his Garden will appreciate the simplicity and effectiveness of this design. The construction is light, yet strong enough for a permanency, being specially designed for the cultivation of climbing Roses, Clematis, etc. It is made entirely of OAK and treated with Solignum, size 7 ft. high above ground level, and 3 ft. 4 in. wide inside. Price £1 each. Orders for three or more will be sent Carriage Paid. Cash with order. These can be made wider than 3 ft. 4 in. if required, prices for which will be quoted on application, stating number required

THE "PERFECTOR" PERGOLA.

This is constructed with the above Arches spaced any distance up to 6 ft. apart. The longitudinal and secondary cross bars to complete the Pergola are supplied in OAK, treated with Solignum, at 1/6 per foot run of Pergola; any lengths to suit your requirements. Thus the price of the Pergola illustrated, 25 ft. long, works out as follows:—

4 Arches at £1 each £4 0 0
25 ft. run Top Bar at 1/6 £1 17 6

CARRIAGE PAID £5 17 6

Kniphofia (Torch Lily), tall orange scarlet, 3, 1/6. **Lavender**, fragrant Old English, 2 year old bushes, 3, 1/6. **Lilies**, hardy Tiger, double or single, 3, 1/6. **Lily of the Valley**, strong flowering crowns, 6, 1/6. **Linum** perenne, beautiful blue Flax, 6, 1/6. **Linaria** dalmatica, spikes yellow, blotched red, 6, 1/6. **Lobelia** cardinalis, spikes rich scarlet, 4, 1/4; **Queen Victoria**, claret foliage, 3, 1/6. **Lupin**, Tree, yellow or white, 3, 1/6; **polyphyllus**, large spikes, blue, white, etc., 6, 1/4; **roseus**, lovely pink flowering, 4, 1/4. **Lychnis** chalcidonica, scarlet Jerusalem Cross or New Salmon Tree, 3, 1/6; **coronaria**, silvery foliage, crimson flowers, 6, 1/6.

Malva moschata, musk-scented, very showy, pink or white, 4, 1/4. **Mimulus** cardinalis, hardy scarlet Musk, forms large bush, 4, 1/4. **Monarda** (Fragrant Bergamot), new Cambridge Scarlet, 3, 1/6. **Montbretia**, spikes, brilliant colours, 12, 1/9. **Onopordon**, tall, very handsome Thistle, 3, 1/6.

Pansies, best large-flowering exhibition varieties, 12, 1/6; separate colours for bedding, blue, white, yellow, red, purple, golden, 12, 1/6; **Coquette** de Poissy, charming for bedding, lovely rosy mauve, 12, 1/10. **Papaver**, Oriental Queen, Salmon Queen, Aristocrat Queen, 3, 1/6; **orientale**, crimson and scarlet, 6, 1/6. **Penstemon**, large scarlet Southgate Gem, Middleton Gem and large Excebsior strain, 3, 1/6; **gentianoides**, blue shades, 6, 1/6. **Periwinkle**, large blue, 4, 1/4. **Pæonies**, lovely new double and single Japanese varieties, all colours, mixed, 3, 1/6; larger, separate colours, 9d. each, very large, 1/- each. **Pulmonaria**, Jerusalem blue Cowslip, very rare, large plants, 1/- each. **Pea**, everlasting, red, white, pink, 3, 1/6. **Physalis**, giant Chinese Lantern, 6, 1/6. **Pinks**, old-fashioned fragrant double white, 6, 1/6; Mrs. Sinkins, 3, 1/6; double, semi-double and single, all colours, very fragrant, 12, 1/9.

Potentilla double crimson, 4, 1/4. **Primulas**, lovely hardy varieties for borders, rockeries, bogs, assorted, 4, 1/4; larger, 3, 1/6; very large, in bud, 1/- each. **Polyanthus**, best large flowering, one year old plants, 6, 1/4. **Primrose**, blue and purple shades, 3, 1/6. **Primula** dentulata, large heads, lilac; rosea, very bright pink; **cortusoides**, rosy purple; japonica, large heads, rich colours; **cashmeriana**, large purple heads; **pulverulenta**, rich crimson flowers on stout stems; 3, 1/6; larger, 2, 1/6; **sikkimensis** (Himalayan Cowslip), sweetly fragrant pale yellow flowers, loves shade and moisture, 3, 1/6. **Phlox**, large flowering, best named, all colours, 3, 1/6; **yerna**, dwarf creeping alpine for rockery, bright pink, 3, 1/6. **Pyrethrum**, Kelway's hybrids, 4, 1/6. **Perennial Sunflowers**, Miss Melish, rigidus, 6, 1/6. **Pyrethrum**, double pink, white, crimson large clumps, 2, 1/6; James Kelway, large scarlet, 2, 1/4.

Rose Campion, bright crimson, 6, 1/6. **Rudbeckia** New-maid speciosa, 3, 1/6; Golden Ball, large double, 3, 1/6.

Salvia argentea, strikingly beautiful silvery leaves in large rosettes, pinkish white flowers, 4, 1/4. **Saponaria**, dwarf trailing, pink flowers, 6, 1/6. **Saxifraga**, mossy, crimson or pink flowers, 3, 1/6; white, 4, 1/4. **Sweet Scabious**, lovely colours, dwarf or tall, 6, 1/4. **Scabiosa** caucasica, large, exquisite mauve flowers, one year old, 3, 1/6; two year,

very large, 1/- each. **Shasta Daisy**, 4, 1/4. **Sedums**, 4, 1/4. **Silene**, pink, compact, 12, 1/6. **Solidago** (Golden Wings), 3, 1/6. **Solomon's Seal**, 6, 1/6. **Stachys** (Lamb's Wool), 6, 1/6. **Sweet Rocket**, purple or white, 6, 1/4. **Sweet William**, new Scarlet, Pink and Crimson Beauty, 6, 1/6; double white, 6, 1/6; double and single hybrids, 12, 1/6. **Thistle** Queen of Scots, 3, 1/6. **Thalictrum**, hardy Maiden-hair, 3, 1/6. **Thrift**, compact, pink flowering, 6, 1/4. **Tritoma** (Red-hot Poker), 3, 1/6. **Tussilago** (Winter Heliotrope), 3, 1/6. **Tunica** saxifraga, dwarf, edging or rockery, 6, 1/6. **Verbascum**, large, tall, yellow, 3, 1/6. **Valerian**, old crimson favourite, 6, 1/6. **Veronica** spicata, tall blue, 4, 1/4; **gentianoides**, dwarf blue, 4, 1/4. **Viola** cornuta, masses of small blooms, lovely for rockeries, etc., Mauve and Purple Queen, White and Blue Perfection, 12, 1/9. **Violas** from seed, Bath's bedding, yellow, white, purple, blue, and mixed (all colours), 12, 1/6; good bedding, mauve, from seed, 12, 1/10; from cuttings, best large mauve, yellow and white, 12, 2/6.

STRONG TRANSPLANTED GREENHOUSE AND POT PLANTS, ETC. **Agapanthus**, blue African Lily, two year old, 2, 1/4. **Agatha** celestis, lovely blue Marguerite, 6, 1/6. **Aralia** (Fig Palm), 3, 1/6. **Arum Lily**, one year, for potting, 3, 1/6. **Asparagus Fern**, erect or trailing, 3, 1/6. **Begonias**, evergreen, perpetual flowering, pots or bedding, 4, 1/4. **Beauty Stocks**, lovely, fragrant, double, 6, 1/6. **Cannas**, Crozy's beautiful hybrids, strong two year old, 3, 1/6. **Celsia** cretica, charming perennial pot plant, spikes yellow and mauve, 4, 1/4. **Cobæa** scandens, handsome, rapid climber, large purple flowers, 3, 1/6. **Cyclamen**, choice strain, 3, 1/6.

Dahlias, Peony-flowered, Collarette, Colossal, single, Cactus, double, etc., 3, 1/6. **Deutzia** gracilis, pot shrub, soon be covered with lovely pink or white flowers, 2 for 2/-.

Echeveria, glaucous rosettes trailing red flowers, 4, 1/4. **Eucalyptus** (Blue Gum), 4, 1/4.

Fuchsias, choice sorts, 4, 1/8. **Francoa** (Bridal Wreath), long trails white bloom, 4, 1/4.

Gloxinias, large erect blooming, lovely colours, 2, 1/4. **Heliotrope** (Cherry Pie), 3, 1/6.

Ivy Geraniums, double pink, 3, 1/6. **Lily of the Valley**, strong flowering crowns, 6, 1/6. **Lobelia** cardinalis Queen Victoria, claret foliage, spikes scarlet flowers, 3, 1/6.

Marguerite Covent Garden White, and large yellow and sulphur, 4, 1/4.

Nicotiana, white or crimson, fragrant Tobacco, 4, 1/4.

Passion Flower, 2, 1/6. **Plumbago**, beautiful blue, 1/4 each. **Primula** obconica, new giant, lovely colour, 3, 1/6; **malacoides**, lilac, 4, 1/4; **kevensis**, yellow, 4, 1/4; **japonica**, Queen of Primulas, 3, 1/6; **cortusoides**, rosy purple, very fine, 3, 1/6.

Rehmannia, handsome large pink trumpet flower, greenhouse perennial, 3, 1/6.

Salvia coccinea, scarlet, 4, 1/4. **Saxifrage** Mother of Thousands, 4, 1/4. **Smilax**, trailing, 4, 1/4. **Streptocarpus**, lovely Cape Primrose, beautiful new hybrids, 3, 1/6. **Schizanthus** Wistoniensis hybrids, 4, 1/4.

Tomato strong transplanted, best varieties, 6, 1/6.

STRONG VEGETABLE AND HERB PLANTS from open ground. **Asparagus**, Kelway's Giant, two year old roots 7/- 100; three years, 10/- 100. **Sage**, **Thyme**, **Mint**, **Marijor**, 3/- doz. **Parsley**, best curled, 1/4 doz. **Spring Cabbage**, **Brussels Sprouts**, **Cos** and **Cabbage Lettuce**, **Leeks**, **Cauliflower**, **Winter Tripoli Onions**, **Pickling Cabbage**, 1/9 100.

STRONG HARDY CLIMBERS. **Ampelopsis** Veitchii, self-climbing, small leaf, large roots, several trails, each 2s. **Clematis** Traveller's Joy and Flammula (Virgin's Bower), white, rapid climbers, large two year roots, 2/- each. **Honeysuckle**, very fine red-flowering Dutch, large plants, 3/- each. **Wistaria** sinensis, large racemes of bluish-lilac flowers, 3/6 each. **Everlasting Climbing Pea**, red, white, pink, 3, 1/6. **Apios**, tuberous rooted Wistaria (not sinensis), rapid climber, sweetly scented purple flowers, 3, 1/6. **Calystegia**, double pink Morning Glory, 3, 1/6. **Passion Flower**, hardy blue and white, 1, 1/4. **Tropæolum** speciosum, tiny flame flowers, glory of the South Islands, 2, 1/6. **Jasmine**, fragrant white flowering two year rooted cuttings, 1/- each; very rare yellow summer-flowering, two year rooted cuttings, 1/4 each; yellow winter-flowering, two year rooted cuttings, 2, 1/9. **Eccremocarpus**, trusses orange-red flowers, 2, 1/4.

Extract from one of the leading Garden Journals, dated March 17, 1923:—"MRS. PYM'S HARDY PLANTS.—This is a catalogue of Hardy Plants for beds, borders and rockeries, also Hardy Climbers, Vegetable and Greenhouse Plants, all of which are in small lots priced carriage paid and offered on money back terms. There is no plant catalogue more to be recommended to the amateur gardener. It is post free from Mrs. Pym, and readers may order therefrom with every confidence of entire satisfaction."

COLOUR HARMONY IN THE ROCK GARDEN

NO one who is in the habit of seeing many rock gardens at this season will question the desirability of an article on this topic. There may be objections, of course, from those who say that in Nature colours never clash; surely rather a sweeping assertion, though one with a deal of truth in it! A rock garden is not natural, however, only an attempt at reproducing the natural, and, in one respect at all events, the attempt is usually not very successful. Just at this season of the year the average rock garden is deficient in greenery. There is a superabundance of blossom, but (to repeat) as a rule a woeful shortage of harmonising foliage.

If we confined our rock garden planting to species and wild varieties, colour clashes would be still possible, but much less probable. The garden varieties of *Aubrietia*, however, to take but one instance, are apt to clash quite badly one with another. The so-called pink and red shades are difficult with the so-called blue tones, and these last again look dowdy in the extreme if allowed to come in juxtaposition with the pure colouring of the *Gentianella* or of the *Lithospermums*.

Then again the brilliant *Lychnis viscaria splendens plena* or the almost equally strident *Calandrinia umbellata* must be used with the greatest care if trouble is not to ensue, and some of the small *Rhododendron* species have, also, that magenta tone which is so difficult to utilise satisfactorily. *R. mucronulatum* has particularly striking and difficult colouring. Many of the purplish and deep rose *Geraniums*, too, have a large share of magenta in their composition.

It has always to be remembered that in the rock garden, groups of plants actually a considerable distance apart may, from some view-points, be brought together for comparison. For this reason it is dangerous to place plants of quarrelsome colouring on "bluffs" or other prominent positions in the rock garden.

In the herbaceous border we usually ensure harmony by the liberal use of plants with grey foliage and inconspicuous blossom. In the rock garden we shall do much better to concentrate on plants which give repose now with their foliage and will provide us with

blossom at another season when flower in the rock garden is even more welcome. There is not the least doubt that the average rock garden is deficient in plants which bloom in summer, autumn or early spring.

Quite a number of the *Geraniums* may be mentioned as summer-flowerers and the foliage of most is interesting the year through. *G. Traversii* is the choicest with its silky, silvery foliage and charming but not striking rose-pink blossoms. The two most useful species for the rock garden however, are *G. G. Wallichianum* and *sanguineum*. The former has blossoms in some shade of light

or dark blue and reddish bracts at the junction of flower stem and foliage, while *G. sanguineum* in its typical form is a fiery crimson not unmixed with magenta. There is, however, considerable diversity alike in habit and in colouring, and it is worth while to collect a good form of this native species. There is a splendid pure white form in commerce and the prostrate soft pink *G. laucastriense*—an invaluable plant—is botanically a natural variety. There is a lovely prostrate form of *G. Wallichianum* called Buxton's variety, which has large violet blossoms. There are, of course, many other interesting and beautiful species, including the Tibetan *G. Pylzowianum*, illustrated on this page.

Again we have the summer-flowering Rock and Sun Roses (*Cistus* and *Helianthemum*), many of which are very interesting in foliage at this season of the year. The grey-leaved beauty of the forms of the perfectly hardy *Helianthemum roseum* is especially attractive. There are many garden forms and hybrids of this species with similarly beautiful foliage.

Many of the *Silenes* flower after the great rush of blossom is over. This applies to that most beautiful of early white-flowering rock plants, *S. alpestris*, but *S. Schafta* is invaluable as one of the best late-flowering alpine. Its purplish red blossoms are borne in late summer and on into early autumn. Another interesting species is *S. vallesia* with rather nondescript coloured flowers.

The *Campanulas* are, of course, a great stand-by when *Aubrietia*, *Arabis*, *Alyssum* and *Phlox subulata* are over and although their range of colouring is not great, there is here an immense diversity of form and habit. The tiny but proportionately large-bellied *C. pusilla* may be had in several fine and distinct forms, including the lovely variety called Miss Willmott. Then there is the large-bellied *C. Allionii* and *C. Zeyssii* with singular bottle-shaped blossoms. Quite distinct again with their relatively large solitary bells are *C. C. pulla* and *pulloides*, while there is a small host of forms of the common Harebell, *C. rotundifolia*, and an equal number of species which are, in fact, little more than forms of this species. Then there are the many forms of the admirable *C. carpatica*, not to be

MUCH LIKE A VERY FINE GERANIUM SANGUINEUM,
G. PYLZOWIANUM.

The smaller *Geraniums* are valuable summer-flowering rock plants.

There are two species of *Chamaecrista* in the United States, *Chamaecrista fasciculata* (L.) Greene and *Chamaecrista nictitans* (L.) Greene. The former is a native of the United States and is much commoner than the latter. It is a bushy plant, the leaves of which are deeply lobed, the leaves of the stem being ovate, and the leaves of the larger branches being ovate or elliptical. The flowers are small and are of a light blue or white color. The fruit is a long, slender, cylindrical pod, which is flattened and is covered with a fine, white, woolly covering. The seed is small and is of a light brown color. The plant is a native of the United States and is much commoner than the latter. It is a bushy plant, the leaves of which are deeply lobed, the leaves of the stem being ovate, and the leaves of the larger branches being ovate or elliptical. The flowers are small and are of a light blue or white color. The fruit is a long, slender, cylindrical pod, which is flattened and is covered with a fine, white, woolly covering. The seed is small and is of a light brown color.

Most of the Gentians on the high alpine rock gardens are spring-flowering, but there are some noteworthy exceptions. The Willow Gentian, *G. sepium*, and all its clams are summer-flowering (i.e., September), and *Przewalskii* are both previous and later species belonging to this section. Two truly alpine species of the first rank are autumn-flowering, namely *G. Farnetii* and *sino-comata*, both are Asiatic species. The equally beautiful and remarkable *G. Kurroisii* is summer-flowering.

That splendid little "Everlasting," *Hebechrysum* bulboides, with its multitudes of white rosettes in charming grey foliage, should be in every rock garden. It will withstand such winters as we have had of late years in any sunny position, but it is a New Zealand, and it would be wise to give it a sheltered position with a south-western exposure, or to put a little stock in a frame in case of accidents.

The *Shortias*, of which the most beautiful is the Japanese *S. uniflora*, illustrated herewith, with pale flesh-coloured blossoms, are late spring or early summer flowering, but their leathery foliage is beautiful the year round. There is an especially fine free-flowering form of *S. uniflora* called *S. u. grandiflora*. *S. galapahua*, the North American species, is less striking when in flower, though handsome enough, but has foliage which takes on delightful crimson colouring in winter. It should therefore be planted in at least half sun, whereas *S. uniflora* prefers shade. Both should have a soil containing a large percentage of decayed vegetable matter.

Closely related to *Shortia* is *Schizocodon*, of which *S. soldanellodes*, with its soldanella-shaped bells (all but tinged in a way no *Soldanella* ever was), is the species usually seen. The colouring is similar to that of the *Shortia*, and this, too, is a shade-loving plant. Closely related to *S. rhinodius* (with rather bell-like foliage)

Another useful family, inasmuch as it flowers before the great mass of rock plants have finished so that of the *Potentilla*. The showiest, and perhaps that account the most useful species for the rock garden, is the bright rose *P. nepalensis*, a strong-growing, summer-flowering trailer now largely overshadowed by the splendid bright cerise coloured variety *Willmottii*. Much choicer and, in a smaller way, even more beautiful, is the exquisite rose coloured *Potentilla nativa*. There is a splendid pure white form of this. Both are rare enough for the nursery. Closely allied to *P. nativa*, but also in cultivation, is the splendid milk-white *P. Christii* which, however, seems to prefer, like the rose, a good *Potentilla* lime.

but a warm and sheltered corner, since they seem to have, like the bulbous and Malvastrum-like et al., no flowering plants, though they have a climbing, rather carefully arranged vine. The species I collected, *M. campanulata*, is one of the best. *M. conopsea* has a more delicate

SAXIFRAGA OPPOSITIFOLIA, OFTEN OF "DIFFICULT" COLOURING.

THE DELICATELY COLOURED SHORTIA UNIFLORA.

THE SUMMER-FLOWERING MALVASTRUM CAMPANULATUM.

NOTES FROM THE EDINBURGH ROYAL BOTANIC GARDEN

MARCH is always a little disappointing in Scottish gardens, and there is not a great deal to be seen in flower out of doors. The Rockery at the Botanic Garden is dominated by Saxifrages—white, pink and yellow, chiefly yellow, and three in particular stand out for effectiveness. The white *Petræschii* (tombæanensis = *Rocheliana*) is one which I have seen blooming profusely here every March since 1912, and it can be recommended as quite one of the best and easiest of all to grow. Then there is another fine hybrid to be noted in Faldonside, with its handsome yellow flowers which are large for so tiny a plant. It is the result of a cross between *Burseriana* × *aretoides*, which also produced *Boydii*, of which the flowers are smaller and the growth less free. Faldonside asks for good drainage and, when convenient, a sheet of glass to protect its blossoms, which open first in February and are apt to get spoilt by bad weather. The third Saxifrage that strikes one as showy and most free-growing is the well known *apiculata* (*Rocheliana* × *sancta*), which may be seen spreading over a large area a sheet of pale yellow bloom. Some people prefer *Elizabethæ* (*Burseriana* × *sancta*) for its closer habit and richer yellow flowers, but at Edinburgh it does not bloom quite as freely. Other Saxifrages blooming here in March include *Rocheliana* var. *coriophylla*, white, with very neat encrusted foliage; *Haagei*, a useful little hybrid bearing small but bright orangy yellow flowers on sturdy 3 in. stems, said to be one of the best kinds for planting outdoors. *Borisii* and *Kyrillii* have yellow flowers and are of encrusted habit; they are both the result of a cross between *marginata* and *Ferdinandi* Coburgi in the Botanic Gardens at Sofia, and were named after the two Bulgarian Princes, Boris and Kyril. The big-leaved *crassifolia* and *ligulata* were well out by the middle of the month, but the little mossy *sancta* was still only in bud, and should be remembered as useful for succession in bloom, also as one of the "easiest doers" in this large genus. This question of succession is often of interest when planting a rockery, and I give the following short list of Saxifrages I have seen out at Edinburgh as typical to the various months. January: *Burseriana* and its varieties; February: *apiculata*, Faldonside; March: *Petræschii*, *ligulata*, *crassifolia*; April: *sancta*, early mossy varieties; May and June: *decipiens*, *muscoides*, *longifolia*; July: *Brunoniana*, *Cymbalaria*; October–November: *Fortunei*.

Apart from Saxifrages there were but few other plants out that might be taken as representative of March. *Shortia galacifolia* does extraordinarily well up here and, despite the fragile appearance of its white bells, so daintily fringed and tinted with pink, they seem to pass unscathed through bad weather. The persistent foliage is always beautiful, daintily marbled and veined, turning to richest crimson shades when autumn comes. *Trillium ovatum* may be seen looking very happy in a low shaded corner bearing several of its large three-petalled flowers of purest white. There is a lowly little bulbous plant out, too, in *Gagea fascicularis*, often called the Yellow Star of Bethlehem because of its yellow striped green starry flowers. It is only some 3 ins. high, and is perhaps more curious than showy. The same may be said of two *Euphorbias*, *E. amygdaloides* and *E. Myrsinites*, both from Europe and more noted for their good foliage throughout winter than for their inconspicuous yellow flowers. The latter species is a really valuable asset to any rock garden for its pleasant glaucous-grey effect,

A few *Primulas* are out, the most uncommon being *P. leucophylla* from the Carpathians, like a pale and delicate Cowslip; and *P. erythrocarpa* from Bhutan, bearing small, lilac, ball-shaped heads and narrow leaves—a miniature and fragile denticulata in appearance.

Shrubs are chiefly represented by *Daphnes* and *Rhododendrons*, and of the latter genus there are four to be seen that can generally be relied on to bloom at this time of year. *R. Metternichii* is not well known yet, but from what I have seen of it here for the past few years it appears to form a nice sturdy little bush, freely covered with bright pink flowers of fair size. *R. ciliatum* is growing over one of the highest and most exposed peaks in the whole garden, yet it seems to flourish in great health and vigour and to bloom profusely,

and it forms a pretty little bush about 2 ft. high. Growing in beds by themselves and forming quite respectable trees one may also see *R. Smithii* and *R. barbatum*, both from Sikkim. Both are bearing vivid crimson-scarlet flowers, and it is noticeable how badly those of *R. barbatum* have suffered from wind and weather, while those of *Smithii* are unharmed. It is just this kind of information one should be on the look-out for as a help when choosing kinds for planting.

Many of the early outdoor *Rhododendrons*, together with rare and half-hardy species, are grown in the spacious glass-house set apart for them in this Botanic Garden. Perhaps the most arresting inhabitant there this March is *R. Campbellii* from Sikkim, which bears a fine, shapely truss of bloom of a peculiarly cheerful shade of pink. The bush is 5 ft. high and a little loose in habit, but the colour and symmetry of the flowers make it very attractive. From one end of the huge glass-house opens a long glass corridor,

THE EXCELLENT YELLOW-FLOWERED SAXIFRAGA HAAGEI.

R. intricatum will always be an attraction for its daintiness and unique colouring of blue-mauve, and *oleifolium* commends itself as a fine plant for windy places, for its position at Edinburgh is in a rocky crevice where draughty winds shake it unmercifully. Its little pinky white flowers seemed quite unharmed and were well set off by its small dark thick leaves.

The most striking *Rhododendron* is, however, not to be found in the Rockery, but in a bed in another part of these gardens. It is *R. quinquefolium* from Japan, and the beauty of this almost takes one's breath away when first one sees it on a grey, "east-windy" March morning as a small, upright little tree some 4 ft. high, with never a leaf, but such a cloud of pink blossom that it reminds one of a dwarf Peach in bloom. Here is a species that will bring joyousness and grace combined with bright colour to any garden, and it is to be found in several nurserymen's catalogues, though sometimes classed as an *Azalea*. Not far from this species is one still smaller, to be seen flowering freely under the name of *R. Kerskei*, also from Japan. Its small pale yellow flowers have a quiet daintiness of their own,

one side of this being a high wall up which climbing plants are trained. Some of these are so long that they hang down overhead and give the pleasant illusion that one is walking along some jungle by-way, an illusion that is heightened by the long bed beside the path, where grow *Strelitzias*, *Clivias* and other plants of sub-tropical appearance. A particularly tall and pendulous climber may be seen in *Bomarea caldasiana* from Peru, of which the clusters of curiously spotted bells, orange and green and yellow, droop invitingly from the root. Of stiffer habit is the rare *Rondeletia Rozei* from Guatemala, which bears the prettiest bunches of pale pink flowers in great profusion. The coral-scarlet tubes of *Cestrum Newellii* provide nice glowing patches of colour, and there are many other interesting plants, as well as some that are better known among the *Acacias*, *Geraniums* and *Camellias*. A corridor such as this might appeal to some amateur gardeners, and should not prove difficult to accomplish, especially if carried out on a smaller scale. The heating arrangements could be of the simplest, and should only be used to prevent the temperature falling below freezing point. M. E. STEBBING.

ROUND ABOUT A SPRING GARDEN

THOUGH the official opening of spring on March 21 was accompanied by the blossoming of more flowers than is usual, there were two among the latter which raised especial interest—two flowers so curiously alike in blossom, so utterly unlike in character, and natives of widely differing parts of America. I refer to *Dendromecon rigidum*, the true Tree Poppy of California, and *Stylophorum diphyllum*, the Celandine Poppy of Wisconsin woods. Of the latter one cannot speak too highly. It might be described as a giant form of our native Celandine (*Chelidonium majus*), bearing splendid golden-yellow Welsh Poppies throughout the season. This Poppywort is a loose-habited, eminently graceful plant of some 2 ft., and it is admirable for grouping with native Ferns or other things which enjoy a cool, semi-shady place.

As for *Dendromecon rigidum*, with its grey-green, very pointed, willow-like leaves, elegant

that this species is as perennial as our climate will allow. In the same colour and also with carrot-like leaves—albeit a carrot that has known the fly, for the foliage is distinctly bronzed—is *Corydalis cheilanthifolia*. This Chinese Fumitory's flowers are much like those of the familiar and naturalised *C. lutea*, but rather larger in the spike.

In a cooler corner where there are old-time, double Primroses, lilac, white and yellow, *Viola sulphurea* in an ivory buff is abloom with the pretty rosy purple *V. California* and others. As for *V. gracilis*, it is almost a weed, if one can apply such a word to the loveliest thing of its lovely world. Like so many other *Violas*, *V. gracilis* is some weeks before its time, as also is the delightful variety known as Perry's Yellow.

Though *Anemone appennina* and *A. blanda* have been in flower for a long while, many of their kindred have remained curiously indifferent to

clan. To this last one may also add the splendid *Chieranthus Allionii*, earliest to flower and last to go over; that equally delightful and fragrant Wallflower known as *C. Harpur Crewe*, and the trailing masses, already studded with bluish purple, of *Erysimum linifolium*—the last, by the way, being a fine dry wall plant.

Two of the *Arabis* breed cannot be overlooked in these early days, the one being the very dainty *A. aubrietioides*, whose delicate shell pink flowers have the grace to overlap their rounded petals, which gives the flowers a firmer, more refined effect; an effect, indeed, which *A. Sundermanni* just fails to achieve, for the reason that its flowers are distinctly starred. Albeit, the latter is a fine and generous all-season plant for any cool and partially shaded place where the high-toned, wild rose pink of its blossoms will escape the bleaching to which it is very subject.

The Bitter Vetches are always among the first of the bantlings of spring, and one gets to like them as much for their independent, optimistic natures as for their elegance and colour. *Orobus cyanens* in a cool, turquoise blue is one of the prettiest in flower as I write, but *O. vernus* in a particularly chaste pink and white form runs it very closely, and then there is *O. pannonicus varius*, another exquisite little Vetch that adds a quiet unobtrusiveness to its other good qualities.

On a dry ledge the bold yellow and deep orange heads of *Sedums confusum* and *Palmeri* thoroughly appreciate these sunny days. But one cannot help wishing that they (and especially *S. Palmeri*) would forget their early habits and come into flower with, let us say, *S. spatulifolium* in one or other of its fat and fascinating forms. Here also on these dry ledges *Iris pumila* in various shades of blue and violet on dim stems, is rejoicing that it has arrived before the slugs, and the ever-delightful creeping Rosemary, which embraces the sun-warmed rocks so closely with its refreshing green, has been toothed with its pale blue flowers these many weeks.

From the woodland, where *Genista fragrans* and *Cytisus præcox* are in full bloom, evening brings the sweetest of all fragrances, that of a bean field. *Osmanthus Delavayi* and the old *Daphne pontica* add their quota to this breath of spring. There are hours and places where the smell of the Cowslips and Narcissi only prevail, and it wants but a few days before the generous scent of Wood Hyacinths will fill the glade with the very essence of an English April.

Among the Heaths and their kindred, *Erica australis* is, perhaps, the most distinguished of its kind in bloom to-day, and the fine dark foliage and purple blossoms of one particular specimen are extremely effective against the soft, plumose branches and grassy green of a group of Tree Heaths close by. *Bryanthus empetrifolius* has raised aloft its little candelabras of prettily crimped Chinese lanterns in rosy pink, and *B. erectus*, which has proved more perennial and more floriferous than we had dared to hope, is also shewing colour. *Gaultherias Shallon* and *trichophylla* are in this company and with the grey-leaved *Andromeda polifolia*—a very worthy native shrubbing, *Vaccinium corymbosum* and others of their clan, are proving their appreciation of a drenching February by flowering earlier and better than they usually do in our sharply drained loam. Here, too, *Sanguinaria canadensis* is unfurling its glaucous purple scroll, a colour which is curiously like that of *Dicentra formosa*'s young growths near by, which latter will in a very few days look like rosy red Wood Hyacinths.

Grateful as one is for all these and more, I am not at all sure, however, that the fresh shoots of verdure which one notices every day, every hour, are not even as cheerful among the tidings

SOFT ROSE BLOSSOMS OF ARABIS AUBRIETIOIDES

form and fragrant yellow Poppies which it produces so abundantly, it is a shrub for which the best place in the garden is never too good. Perhaps sentiment has something to do with my affection for it, for was it not on its own glorious hills when they were azured to the summit with *Ceanothus* that I first beheld this beautiful object in such perfection? However, beneath our comparatively dull skies the offspring of those radiant mountain slopes does very well, often giving us a blossoming season that extends from spring to November; but it so obstinately refuses to come from cuttings that it remains scarce and expensive. As for seed, Mr. Payne of Los Angeles persuades me that even this has to be boiled before it will bring forth seedlings.

And so to the rock garden where *Veronica hirtella* is dappled its close-clinging mat of green with bright little Speedwells in a pure, cool blue, and here *Eichscholtzia tenuifolia*, partly as a half-grown Carrot, is holding erect a dozen of its dainty golden saucers. This little charmer, grown as an annual, usually leaves us when winter approaches, but these stray survivals are welcomed for their early and pre-blossoming, and they suggest

the early season. *A. triobata* arrived, as usual, just before the wild *Anemones* of the wood, and very prim and chaste it looks in its orderly little colonies. The *Hepaticas* have given us an extra long season, and these have kept the good wine to the last in the form of *A. Hepatica hibernica*. Who is responsible for the creation or discovery of this beautiful variety I have forgotten, but whoever it may be deserves the gratitude of all honest gardeners, for the big, upstanding blooms in a particularly appealing shade of blue lavender or smoke blue with a dark eye are extremely fascinating.

Ethionema ibericum is a fine, hearty plant in the early rock garden, covering its pretty carpet of glaucous foliage with heads of large, dead-white flowers which have the sweet keen scent of new-mown hay. Just below this generous and easy-tempered thing, some *Soldanellas* are expanding their fringed tassels to the sun. *Morista hypogaea* is a close-set mound of deep and glossy crinkled green, inlaid with the mustard yellow of its opening buds, while round about it is a cheerful family of baby *Moristias* which are also beginning to show the crimson badge of their numerous

of spring as the blossoms themselves. Who can mark unmoved the first green whorl of the Woodruff, the emerald which breaks from the Stehwort's wintered straw? The first furry crozier of the Bracken is a revelation which means much to all who love a garden well, and Nature more. Then there are those grassy growths on the Dianthus, so ardent with promise, the glossy bronze with which the Alpine Phloxes have revived their weathered mats and the deeper green which has come to the creeping Thymes. What is more lovely, more suggestive of spring, than the exquisite delicacy of the Epimedium's silken trefoils, or the first whiff of perfume from Penzance Briars, or those quaint little spoons of vivid green which have appeared among the brown, sapless foliage of Corokia Cotoneaster? A few weeks ago a more sorry sight could not have been found in the

garden than was presented by the wind-worried Mossy Saxifrages and all those woolly and silvery things which shrank so pitifully from the continuous wet. But the recovery of these convalescents, the repairs which have been executed with such miraculous spontaneity by spring's healing artistry, the green and the gloss of life renewed and beauty restored, these are not the least of the season's joys. N. WALES.

HARDY PRIMULAS

The Farinosa Section.

ALTHOUGH this section does not figure among the most important groups of the genus *Primula*, it contains several pretty and useful species. There are some eight or nine that are worth growing and they come from the various countries in the North Temperate regions, extending from Western North America to Europe and Northern Asia, while one comes from the Magellan region of South America. Without exception all are hardy in this country and although the conditions under which they are found in their native habitats must be of a widely divergent nature, it is possible to grow them successfully under practically the same conditions here.

While being practically perennial, some of these *Primulas* often prove short-lived in this country, and die after flowering. It is thus essential, in order to keep up a supply, to make frequent sowings and raise fresh stock. Most of them seed freely, and the seeds germinate readily when sown fresh. They enjoy a deep, moist, loamy soil, and in the northern part of the country a partly shaded position is preferable, as they get burnt up in the

hot, dry summer. The best kinds are:—

P. ALGIDA.—This marsh-loving species is a native of the Caucasus and is nearly allied to our native *P. farinosa*. The finely toothed, obtuse leaves are, however, larger, while the flowers are more showy and of a rich violet-purple colour. It is somewhat rare in gardens and generally dies after flowering. It grows best in a half shady position, planted in a mixture of peat and loam with abundance of moisture when growing.

P. CAPITELLATA may be described as a small edition of the Himalayan *P. denticulata*, with flowers almost like those of *P. farinosa*. It is also a bog plant from Asia Minor and loves plenty of moisture.

THE ROSY-LILAC PRIMULA DARIALICA

P. CONSPERSA.—This is more nearly allied to the *sibirica* group, producing tufts of similar leaves, ovate linear in outline, notched at the edges and about 4ins. to 6ins. long. The scapes are from 12ins. to 15ins. high, covered near the top with a meal, while the rose-pink flowers are produced in two or three whorls. It was collected by Mr. Farrer in Kansu.

P. COGNATA is one of the many new plants introduced from Western China by Messrs. Veitch and Son, through their collector, Mr. E. H. Wilson. He found it growing along with *Meconopsis pumila* in open valleys in Western Szechuen, at an elevation of over 12,000ft., usually on loamy banks. The leaves and stems are slightly mealy, while the lavender-coloured flowers, in heads of six to eight, are about the size of those of *P. longifolia* and borne on stems 6ins. high. Like many others of this popular genus, *P. cognata* appears to be only a biennial. Seeds, however, are freely produced and the plants flourish under conditions suitable for our native species.

P. DARIALICA. A native of the Caucasus, this is a free-growing plant with tufts of mealy leaves 4ins. long. Numerous flower stems, 6ins. high, are produced, often twelve or more on each plant, these carrying from eight to twelve good sized, rosy-lilac flowers. It makes a good plant for growing in pots or pans for the alpine house and also does well in shady positions in the rock garden.

P. FARINOSA (Bird's-eye Primrose), which is found in many parts of this country, is very appropriately named, being covered all over with a white mealy powder which gives it a silver appearance. It is usually found growing on moist loamy banks and is a lime-loving species. Both in its wild and cultivated forms it is one of the most

THE BIRD'S-EYE PRIMROSE, PRIMULA FARINOSA.

attractive and pretty little *Primulas* that we have. It is a plant that can be grown with little trouble, its chief requirements being moist soil in half-shade. A good perennial, it soon grows into good sized tufts. In April, numerous flower stems, 6ins. or more high, are produced, bearing heads of flowers of various shades of blue to pure white. There are many forms of this species, of which the most distinct is *P. farinosa* var. *scotica*, or *P. scotica* as it is often called. It is found in the pasture lands of Caithness and in the Orkneys, and bears flowers of a rich violet-purple colour on very short stalks. *P. magellanica* is another form from South America.

P. FORTUNEI.—This is one of the least hardy members of this set and requires to be kept in a cold frame during the winter months. Owing to its early-flowering habit it is a useful plant for the alpine house when grown in pots. It is probably of hybrid origin and appears to be intermediate between *P. denticulata* and *P. farinosa*. The leaves are coarsely dentate, with a little farina, while the stems are 3ins. to 4ins. high, terminating in loose heads of flowers. These are about 1in. in diameter and bluish-lilac in colour, with a primrose-yellow eye. It is a good perennial and easily increased by dividing the crowns soon after flowering. It is a very old garden plant, but is not common.

P. FRONDOSA.—A beautiful tree-flowering species from the Balkans, which may be described as a large-leaved *P. farinosa*. It is quite hardy in this country and will grow well in a half shady place,

planted in moist, sandy peat and loam. A good perennial, it is readily propagated by dividing the crowns after flowering. It is one of the most useful early-flowering *Primulas* for growing in pans for the alpine house as well as one of the easiest to grow.

P. LOCZII.—A native of Kansu, where it was found by Mr. Farrer, this species is remarkable for producing stolons in the way of a Strawberry plant. It is thus easy to increase as it soon spreads and forms wide tufts. There is little meal on the leaves, while the stems are about 4ins. to 5ins. high and bear pale blue flowers in April. It is quite hardy and soon makes itself at home in a moist, shady position.

P. LONGIFLORA.—A beautiful and distinct species from the mountains of Southern Europe, it is remarkable for having flowers with a long tube rim, or more in length. These are blue in colour, of good size and produced in April and May. It will grow under similar conditions to those which suit *P. farinosa* and like that species it has its leaves powdered with meal.

P. MODESTA.—This is the Japanese form of *P. farinosa*, with tufts of mealy leaves and rosy-lilac flowers early in April. It is quite hardy but does not grow so tall as our native plant.

P. STRICTA.—This is simply a small state of *P. farinosa* from Northern Europe. The leaves are denticulate with rounded teeth and have no meal on the underside. The pale pink flowers are borne in loose heads or stems 4ins. to 5ins. high. W. I.

them. The quaint little Aroid, *Arisarum proboscideum*, pokes up its glossy triangular leaves and odd-shaped flowers among the Anemones. Some people see in the flower a resemblance to an elephant with uplifted trunk; others liken it to a scared mouse bolting down a hole! Anyhow, it is an uncommon and interesting little plant, appreciated by all who enjoy strange flowers as well as showy ones.

One unlucky day a small piece of *Helxine Solierii* was planted in this border, and has since been the cause of much back-aching labour in vain efforts to abolish it, since no amount of scraping and scratching has much effect on this Uriah Heep of a plant. It looks so neat and promising a carpeter with its attractive green foliage that the unwary hail it with joy and plant it reverently near cherished alpenes, only to find that it is a more rampant smotherer than *Arenaria balearica*, without any redeeming beauty of flower. The only use I have found for *Helxine* is to let it ramp over *Primula rosea* in summer, when it keeps the *Primula* roots cool, and it pulled up in handfuls in autumn a sufficient stock will be found to come up again to repeat the process the following season. A few shade-loving Daffodils have been squeezed into the border as well, and the best of these is the little Spanish *Narcissus moschatus* with very charming drooping white trumpets. *N. cyclamineus* found conditions too dry and did not thrive here, and *Tropædium speciosum* proved another disappointment, though theoretically the position was ideal for it. N. G. HADDEN.

A SUCCESSFUL NORTH BORDER

OWNERS of small gardens often find it difficult to make good use of narrow strips of border facing due north, so that an account of one which has proved a success may be of some interest. Being a very narrow border (only 2ft. wide and 15ft. long) against the wall of the house and, moreover, full of the roots of *Cydonia japonica* and *Solanum crispum*, which are trained up the wall, it did not appear a very promising site for choice plants. After several years of experimenting, however, this little border has become full of interest and is seldom without some flowers at all seasons. The soil was top-dressed with a mixture of virgin loam, peat, leaf-mould and a little lime-rubble, which last ingredient is especially appreciated by the *Cyclamens*.

Cyclamen neapolitanum is the main feature of the border, and is a great success, seedlings from the four original corns having been planted all along. The great variety of form and marbling of the foliage is one of the charms of this invaluable species, while the pink and white blossoms brighten up the border in August and September, just when the other occupants are dormant. A single corn of *C. neriifolium album* planted three years ago is cherished more for the beauty of its very large dentate leaves than for its somewhat scanty crop of flowers in March. Some seedlings of the later-flowering crimson *C. repandum* must be added to this little colony, but as this species is flourishing in a southern exposure it is perhaps asking too much of it to adorn a north border also. The native Oak Fern is encouraged to wander as it will among the *Cyclamens*, where its graceful fronds show to full advantage in early summer when the *Cyclamen* foliage dies down. The exquisitely beautiful *Anemone Alleni* is spreading in a most heartening manner, and the flowers remain in perfect condition much longer than when they are fully exposed to the sun. It is a delight every spring to see its buds and leaves pushing through the soil in an ever-increasing circle from

the spot where the original tuber was planted four years ago. *Anemone Blue Bonnet* and *A. nemorosa grandiflora* are most recent introductions, but both appear to find the conditions equally congenial; they are all the more welcome here since the wild Wood *Anemone* is strangely absent from most West Somerset woods. *Eupedemum Muschianum*, a neat-growing white-flowered Japanese, enjoys similar conditions, and though it is increasing steadily, is not an invasive species like too many of the genus. Several species of *Primula* have been tried, but the border is much too dry for their liking, so that now only *P. Julia* remains, and is thoroughly happy creeping over the edging stones with its roots kept cool beneath

A NEW BARBERRY

BERBERIS REPLICATA, which recently received an award of merit (see April 7 issue, page 173), was raised from seed collected at an altitude of 11,000ft. in open scrub on the Shweli-Salween divide by Mr. Geo. Forrest and sent to the Royal Horticultural Society. It is evergreen, and the rather small leaves with recurved margins are grey below. It is an early and very profusely flowering species, blossoming freely in the young state and very pleasing from its habit of flowering all along the branches, which in older plants arch gracefully. The plants at Wisley are about 2ft. high, but eventually reach 4ft. or 5ft., and bear deep crimson fruits. It appears to be perfectly hardy. F. J. C.

GREENISH YELLOW BLOSSOMS AND DARK GREEN AND GREY FOLIAGE OF *BERBERIS REPLICATA*.

NOTES ON BULBS

DUTCH CROCUSES.—Is it only my imagination coupled with a faulty memory that makes me think all these Crocuses are taller and more lanky than usual? The basal tubes of the flowers seem to be longer than they generally are, and their extra length is by no means an improvement. The exception is the old yellow. This does not shew any difference from the usual. Truly it is a very remarkable plant—a really great plant. By vegetative reproduction it has gone on unchanged for generations. No one has ever gathered a single seed from all the countless millions that have flowered in countless bulb fields and gardens, and yet it is as healthy and vigorous as if it was just starting life. We should disturb it as little as possible, for its yellow never looks so rich as when many small-sized blooms are clustered together in solid masses. It, too, approaches more nearly to the style of the dainty species, which is no slight recommendation. After the yellow come the purples in my estimation.

There seems to be something in the colour itself which, as it were, harmonises with mere size, hence the old *purpurea grandiflora* looks well although it is so large. To this I would add two which I think I am right in saying are much newer, namely, the dark rich *President Cleveland* and the very large deep-coloured *Hero*. After the purples come the lavenders or pale mauves. *Dorothea* (syn. *Maximilian*) is undoubtedly my favourite. As an additional recommendation for gardeners under glass may I say it is one of the very best to grow in pots. It is less floppy than the majority. *Margot* comes *proxime accessit* to *Dorothea*, but it looks a little too large for its delicate colouring. *Cambridge blue* and *Charterhouse pink* do not harmonise with sixty! Lavenders and mauves are followed by whites. Far the most satisfying to me is the moderate-sized, round-shaped *May*. I am quite content to let the size-worshippers buy up all the *King of the Whites* and *Kathleen Parlows* and *White Giants* if only they leave a few of this really beautiful flower in the dealers' hands. After the whites, but at a very considerable distance, there are the striped. I cannot bring myself to like them.

In a collection of Dutch Crocuses they must necessarily be included, but otherwise I would never plant them in my garden. Yet there must be people who like them and buy them, otherwise there would not be so many of them in our bulb lists. *Edna* and *Mikado* are about the best. *Margot*, which perhaps ought to be classed under this head, I have already mentioned, but it is more shaded than striped.

CHIONODOXAS.—These beautiful bright little flowers have not been fifty years in British gardens, but they have caught on wonderfully. There are probably few to whom they are unknown; but not everyone knows how much they improve in size and effectiveness when they are left undisturbed. I never even take off the seed-pods, but let the seeds shed all over the beds where they are. The result is the soil is so full of *Chionodoxas* that it bears digging and preparing for other plants—e.g., *Aquilegias* and *Tulips*—without any diminution of their numbers. I think the blue and white *Lucilia* is more prolific than the all blue *sardensis*, but I am not sure. Which is my favourite I never know. I could be happy with either "were the other fair charmer away."

THE RETURN OF THE PRODIGAL.—While horticulture remains the name of William Wilks can

never be forgotten, but the individual ties which bound him in one way or another to his friends will be snapped. *Narcissus cyclamineus* I always associate with the late secretary of the R.H.S. and with another good friend of mine, the late Andrew Kingsmill, who was one of the first to appreciate the immense possibilities of the work among *Daffodils* that was being done by the then, comparatively speaking, unknown parson of Appleshaw. In the thin woodland which formed part of poor Kingsmill's garden at Harrow there

the surprise was great when it turned up again by a streamside in Portugal after being lost sight of for nearly three hundred years. The perianth segments are quite as much reflexed as in a *Cyclamen*, but when we have very nearly as much reflexing in the triandrus branch of the family, one rather wonders at the cock-sure unbelief of the eminent one about Vallet's picture. *N. cyclamineus* sets seed very freely and can readily be increased by this means. Plenty of hybrids have been raised between it and other sections, but only a very small proportion have perpetuated themselves. Most have soon died out. Still, the crossings are worth making; there is something very charming in

cyclamineus hybrids even if they are only birds of passage. The Prodigal is with us now; let us by all means in our power make the most of him.

"THE GREATLY INFIRIOR EMPEROR"?—I cannot sit down quietly and read what is said in *THE GARDEN* for March 17 (page 130) about our good old friend Emperor. "Old friends are best," so until I find that King Alfred will grow and flourish in far more gardens than it does at present or has done in the past I will never place it as a garden plant as the equal of Emperor. If Cornwall was England it might be different. Mr. E. M. Crosfield, who knew all the tricks of the trade, could never get King Alfred to flourish in his garden when he lived near Wrexham. Fourteen miles off, in my own garden, neither love nor money will persuade it to live anything but a life of misery. The first time it flowers it may seem all right, but summer it and winter it and see what happens then! JOSEPH JACOB.

[**NARCISSUS TRIANDRUS HYBRIDS.**—Mrs. E. M. Crosfield sends a photograph, which is reproduced herewith, which conveys a good deal of the charm and grace with which all the hybrids of *Narcissus triandrus* are endowed. The Angel's Tears is

HYBRID SEEDLINGS OF NARCISSUS TRIANDRUS.

was the finest mass of this strange-looking little flower that I have ever seen, while in the garden of the Wilderness at Shirley in a very similar position there were a good many fine specimens dotted here and there "all over the place," which impressed me very much. I have used the epithet "strange-looking" to this flower; not without reason I think you will say, when I tell you that the accurate representations of the plant in the picture books of Pierre Vallet, which gave illustrations of the contents of the gardens of the French Kings Henri IV, Louis XIII and Louis XIV, were once considered by one of our eminent botanists to be wholly imaginary. Naturally,

not a long-lived species, and most of the hybrids are slow of increase and apt to be short-lived also, which is annoying when one has a specially beautiful form, but the species crosses readily, the seedlings are easily raised and, as a rule, flower in from two to three years, and all can be relied upon to be beautiful and—important point!—harmonious in colouring, for *Narcissus triandrus* always imposes a great deal of its pallid colouring upon the seedlings. Pale colouring is always delightful in the *Daffodil*. Strong colour seems to distract attention from the beauty of form of this gracious flower.—Ed.]

ANNUALS FOR THE BLUE BORDER

ONE meets with a large number of "blue borders" in which all the flowers are chosen for the fact that they possess that inimitable colour. Wonderful pictures are produced in spring and early summer, right from the days when the first Hepaticas open their timid buds until the passing of the last Delphinium. A rich and satisfying feast of gorgeous flower, but—what then? That is the question that many find very difficult of solution, for with the shortening of the days blue becomes rarer and rarer. It is just here that the good old hardy annuals and half-hardy annuals come to our assistance, for there are large numbers of these easily raised at the cost of a little time and trouble, the "blueness" of whose blood is beyond all question and who will—if we time the sowings correctly—step into the breach, just at the psychological moment, and carry on the blueness of the blue border until the latest autumn days.

Let us take those of the half-hardy class first, for it is these that require the earliest attention in sowing under glass in the cool greenhouse. Agatheia, also known as *Aster capensis*, is delightful in full sun and—although not strictly annual in its duration—responds very readily to culture in this way. The plant makes a low-growing shrubby bush covered with a profusion of the daisy-like "china blue" flowers from June to October. Much depends upon the variety of the *Ageratum* you choose, as to how much blueness you get, although all of them possess sufficient to warrant their inclusion. A favourite of mine is that known as Little Blue Star, a compact, bushy little plant about 6 ins. in height. Another annual that certainly merits a trial is the annual Alkanet—*Anchusa*. This reaches a height of 1½ ft., with a profusion of clear blue flowers that give a fine show in the mass. Another "Little Blue Star" is found in the dainty little *Brachycome*, or Swan River Daisy, an Australian annual deserving the widest popularity. For broad clumps or as edgings to the blue border it is unequalled, and gives such a mass of tiny light blue cineraria-like flowers that these almost hide the small pale green foliage. Sow early, but do not use too much heat, and plant out rather closely after careful hardening off. Many are under the impression that *Browallias* will only grow in the greenhouse, but to them I would say "try and see." Many years ago I made the experiment and found the plants to be an inexhaustible store of unmatched blueness, lasting for months. There are no *Asters* that quite satisfy me for the blue border, although one uses the single *sinensis* as coming the nearest to one's requirements, and a point about this is that seeds may be sown in April where the plants are to flower, and will then continue blooming very late indeed, although I mention it here in case early blooms are wanted, in which case the season must be anticipated by sowing under glass. *Lobelias*, of course, will occur to mind as of quite undisputed blueness, and generous sowings should be made so that a very large number of plants is on hand when planting-time comes, for one can "tuck these in" almost anywhere, and their blueness persists until the very hardest frosts kill them off. Few people seem to know that the glorious Forget-me-not, *Myosotis azurea*, that makes such a superb grounding for beds of bulbs in the spring garden, can be had in autumn by the simple expedient of sowing the seeds in gentle warmth in spring and planting out. August and September see these plants a perfect blaze of flower, dwarf and compact and of a blueness that the bluest blue lover cannot criticise. Make a

note of this for this purpose; it is a gem. Two of the genus *Salvia* are grand plants, and both of the "very easy" order. *S. farinacea* is especially useful, as it achieves the height of 2½ ft., a useful point when grouping among early taller growers that can be cut down considerably. *S. patens*, known to all blue lovers, though fleeting in duration of its individual blooms, continues to open these in succession over a long period, while its very blueness compensates any shortcomings in the way of duration. If you have not tried it, you should be pleased with the new strain of *Statice sinuata* (known as True Blue), for in this the tendency to blue has been eliminated and the flowers are a clean navy blue.

Now let us suggest a few hardy annuals that may be sown *in situ* and that give the minimum of trouble. The blue Pimpernel, *Anagallis Phillipsii*, should be used for bold patches well forward in the border, and it is better not to sow until the middle of April, as late frosts are liable to catch plants that are too forward. Suited to a similar position and equally attractive is the blue Woodruff, *Asperula azurea setosa*, though this is a very pale colour. Do not omit the dwarf *Convolvuli*, for these, in their season—which is by no means a short one—present a massed blue effect of the finest quality and are a grand addition to the border. Cornflowers are certain to be well represented, and can be sown anywhere where a plant 2½ ft. to 3 ft. high is desired. Spring-sown plants invariably do well, but there can be no question that—for length of life and multitude of bloom—those sown by the previous year's plants in autumn are the best, and if you have any of these in odd places that are not just where you want them you can now transplant with safety.

For late summer and autumn the annual Rocket Larkspur, *Delphinium Ajacis*, is simply wonderful. Tireless in flowering and very double, a bright indigo blue, the plants attain a height of 2½ ft. and take up the story just at the point where the Cornflowers are beginning to become shorter in the stem, thus replacing them, too, in the direction

of cut flowers as well as of border decorators. The branching D. *Consolida coerulea* should not be omitted either; it is an equally valuable plant and makes a great show. Sweet Peas in various shades of blue are a great "height" stand-by, and always welcome for their lengthy flowering season and fragrant blossoms, which, again, are invaluable for cutting purposes. Do not omit the common blue Flax from your list. This is listed as *Linum usitatissimum*, a somewhat fearsome name, but the plant is all right—a very dainty little thing in pale azure blue, of light, elegant habit and smothered with flowers. By contrast *Nigella damascena*, the Latin name of Love-in-a-Mist has a compelling sound about it, and you will not go far wrong in using this lovely hardy annual lavishly, especially the variety Miss Jekyll with its charming bright blue flowers "veiled" in their misty leafage. Right in the front, beside the path edge, most charming little patches of brilliant deep blue can be obtained by sowing *Phacelia campanularia*, a free, and continuous-flowering little plant. H. W. CANNING-WRIGHT.

A BEAUTIFUL BORDER CRANESBILL

ONE of the most beautiful and interesting of the taller-growing *Geraniums* is *G. anemonifolium*, a native of the Canaries. As the illustration shews, the plant has handsome foliage, and the scale of the picture will be appreciated when it is noted that the flowers are an inch or more across, satin rose in colour, deepening to crimson at the eye. The stamens also are crimson. This is a splendid plant for not too exposed a place in the wild garden, for it seeds freely and will even naturalise itself. Shelter from the east is desirable, since the plant makes new growth in winter-time. Unless in very deep fertile soils, shade from midday sun is also helpful. The flower-stems are thickly covered with silky hairs.

The plant remains in blossom for a length of time. This and the beautiful *G. Wallichianum* are probably the most useful garden species of this very useful genus.

A BEAUTIFUL SOFT ROSE BORDER PLANT, GERANIUM ANEMONIFOLIUM.

CORRESPONDENCE

A CHOICE SPEEDWELL.

THE history of the Speedwell mentioned on page 156 is as follows: About 1803 Mr. Wolley Dod gave me a plant and said he found it by the roadside in Hungary. No botanists, either German or Russian, could give it a name. The late Mr. T. Smith, Newry, asked me for a plant, and a few years later I was rather amazed to see it described as "Veronica species E. C. Buxton—a gem for the rockery." Mr. T. Smith said he had tried to get it named at Kew (and, I think, at Edinburgh) without success. He also said that no visitors came to his nursery without taking away a plant. About 1914 it was recognised at Kew as *Veronica peduncularis*, from the Caucasus. If this *Veronica* is cut back after flowering it soon flowers again.—E. C. BUXTON, *Beltus-y-Coed*.

A PLEASING FLOWER BORDER.

IN the Bournemouth district there is a garden containing a large border filled with bulbous and other flowering plants in such a way as to produce nearly all yellow in spring, blue in the summer and, mainly, rose, mauve and lavender colours in the autumn. It has been a great success, and its general appearance seems to be more interesting and attractive each year. I have not been closer to it than the entrance gate, but one could see practically all the principal occupants of the border, which is about 150ft. long and 15ft. wide, almost level with the drive, scarcely raised at all at the back. In spring yellow-flowered Hyacinths, Tulips, Crocuses, Narcissi and *Doronicums* predominate; in the summer, Delphiniums, Cornflowers, Scabious, etc.; and in the autumn, Chrysanthemums, Michaelmas Daisies, etc. When I first observed this border several years ago I noticed that great care had been taken to avoid overcrowding. All the occupants seem to be well established now, but there is not any overcrowding, and at the same time the border from February to the end of November has a well furnished appearance. There are, I am sure, many borders in our gardens filled to furnish practically self-colours from season to season, but I thought a brief description of the one referred to would prove interesting to many readers of THE GARDEN.—HANTS.

PACHYSANDRA PROCUMBENS.

THIS is quite an interesting herbaceous plant, which has the additional merits of being beautiful and uncommon. Its attractiveness lies chiefly in the thickened stamens from which it derives its generic name. It belongs to the *Buxæ* section of the *Euphorbiaceæ*, being closely allied to *Buxus* and *Sarcococca*, but differing from both in habit of growth. The fruits, like those of *Buxus*, are capsular, but the leaves are alternate instead of opposite, while the fruits of *Sarcococca*, which stands alone, are baccate. The sweet-scented flowers are monoecious on the same spike; the staminate flowers, which are in the majority, being above, while the few pistillate blossoms are below. All are without petals, the staminate flowers consisting of four greenish purple sepals, four stamens, which are opposite the sepals, and long thick filaments from one-third to half an inch long, which are exserted; while the few pistillate flowers, the sepals of which are variable, have a three-celled pistil, with two ovules in each cell and three comparatively large fleshy styles, which are spreading. The plant is of spreading habit, with stout, unbranched stems about 4ins. in length, bearing at the top a cluster of dark

bronzy evergreen leaves from 2ins. to 4ins. long, ovate or obovate, obtuse or acute at the apex, the upper part coarsely dentate, the lower part entire, narrowing at the base into a petiole, either equal to or shorter than the blade. The foliage gives the appearance of a ring surrounding the

THE REMARKABLE HERBACEOUS PLANT PACHYSANDRA PROCUMBENS.

dense cylindrical spikes of flowers, which rise from the axils of the scales from the lower part of the branches in March and April.

The culture of the plant is quite simple; it grows in ordinary soil and is a suitable plant for woodland or a semi-shady position, although here, at Cambridge, it is fairly in the open, though the shade of some trees passes over it. It can be propagated from cuttings, but the most convenient method is by division. It is a native of the South-Eastern United States and known as the Allegheny Mountain Spurge, but it is also found in Carolina and Kentucky, and was introduced into this country in 1800. Other species of this interesting genus suitable for similar positions are *P. axillaris*, a Chinese species, and *P. terminalis* from Japan, as well as a variegated-leaved variety of the latter, sometimes grown in greenhouses as a foliage plant, although it appears to be perfectly hardy.—F. G. PRESTON, *Botanic Gardens, Cambridge*.

AN EARLY-FLOWERING ROCK PLANT.

THE *Scrophulariad*, *Synthyris reniformis*, is a native of North-West America, from whence it was introduced about 1885, but in spite of this fact it is rarely seen in gardens. It is difficult to assign a reason, because it is of easy culture, a free-flowering plant which often opens its first flowers early in the year. The tubular blooms are about a quarter of an inch in length, pale violet in colour, and they are produced in quantity on erect spikes 6ins. or more in length. The leaves also are attractive, being deeply toothed at the margins. This plant is quite hardy and in its native habitat it is found growing in moist places, so it should be given a damp spot in the rock garden; although I have grown it successfully

in various positions, except where it is heavily shaded. A cool loamy soil is needed, and in a dry season it may require water at the root to keep it going until more moist conditions prevail. This year it has flowered freely, and the earliness of *S. reniformis* should warrant it a place in every rock garden, while for an alpine house it would be found most useful for an early display. The plant can be increased by division and from seeds,

but these are sparsely produced even when the flowers are pollinated by hand.—T. W. B.

PLANTING POTATOES.

I WAS much interested in the article on Potatoes by Mr. Wm. Taylor, issue March 24, page 154. I would like to refer here to one point, the method of planting as practised by Mr. Challis, who is so well known as an expert horticulturist. The method adopted by him and referred to by Mr. Taylor was to my knowledge carried out by my father once after levelling an old hedge bank. There was a good depth of soil and, being very busy, he simply dropped the "sets" on the surface about 3ft. apart each way and covered each "set" with a spadeful of soil. Later he placed one spadeful of soil in the centre of the haulm of each root. Manures were not used; the haulm covered the whole of the soil, and my father said he never filled a sack with Potatoes so quickly as he did when lifting the resultant crop, which was a very heavy one.—G. G.

ABOUT MORELS.

"ANNE AMATEUR," in one of her versatile "chit-chats" some time ago, deplored her inability to find Morels. I must, while sympathising with her, congratulate her on her veracity. In France we say, as near as I can translate it, "It takes a good liar to find Morels"; but joking apart, I am a few weeks late in writing this, but on March 24 a friend brought me two Morels. I knew that for some time past they were to be found, but had not had the leisure myself to look for them. There are in the family of the *Morchellaceæ* at present to be found the following: *Morchella rotunda* (Pers), round-headed Morel, dirty grey in colour, March and

April: *Morchella vulgaris* (Pers.), similar, but somewhat darker in colour and more conical in form. There are other common varieties, but, in the way of taste at least, there is little to classify them. Perhaps the most common is *Morchella conica* (Pers.). All are comestible and quite easy to distinguish from other fungi by their characteristic spongy head. At this season there is not the slightest danger of making a mistake; while even in summer, *Phallus impudicus*, which resembles the *Morchella* in form, is edible, though its perfume would be enough to deter the most enterprising mycologist. Now, to find Morels from March to May, look for them in newly cut woods on sandy soil, especially Elm woods and those containing Privet, more often towards the edges than in the woods themselves. When you have found your Morels, cut them in half, wash carefully and dry. The sandy soil they like makes them, unless properly prepared, a gritty dish; also, being hollow, many insects make their home in their centre. Now, to cook them, they are excellent chopped up in an omelette or round a small roast of veal; but to appreciate them properly, *sauté* them lightly in butter (*without* garlic, parsley or other herbs) and you have a *plat* worthy of Lucullus or Cæsar.

Not having been born in England, perhaps I make a mistake, but I always thought of the Cowslips as being perfumed, perhaps because

of the cowslip wine that I have been privileged to taste in England. Here, the Cowslips are absolutely devoid of any scent; but the white Violet equals, it it does not surpass in odour, her darker sister.—FOREIGN LEGATIONAIRE, *Scène et Mœurs*, France.

[The English Cowslip (*Primula officinalis*) is certainly fragrant, though the fragrance is not at all overpowering, and it is this fragrance which forms the bouquet of cowslip wine, which, properly made, is surely among the most elegant and most delicate of drinks, though by no means lacking in potency.—ED.]

A SUPERIOR DEAD NETTLE.

ABOUT twenty years ago Mr. Wolley Dod gave me what he described as a superior form of *Lamium Orvala*. It is much dwarter than the plant usually so called. Mr. P. Neill Fraser of Edinburgh gave me the same thing. In Mr. Bowles' "My Garden in Spring" it is referred to as *Orvala lamioides*. In 1910 a pure white seedling appeared—a very beautiful thing indeed. Many of my friends had the seed, but as far as I know no white seedling has appeared. In 1921 a great many seedlings came up here. One of these is now in flower and is pure white. My gardener hopes to root a cutting. Hitherto the plant has been so valuable to me that I did not like to interfere with it.—E. C. BRETTON.

SOME LATE DESSERT APPLES

IT is acknowledged by fruit growers that there is an abundance of good early and mid-season dessert varieties of the Apple. Late-keeping sorts, however, are not so plentiful. There are a few and they ought to be better known. I say this after careful observation, for I have seen many empty fruit rooms of late. In other establishments some useful late-season varieties have come under my notice. The notes that follow will bear upon their characters. These have formed matter for study in the orchard as well as in the field.

The first variety is KING'S ACRE PIPPIN. It is of medium size and bright appearance. The yellow ground colour of the skin is striped with red. Ribston Pippin is one of the parents of this variety. The flavour of the two is very similar. In a well appointed fruit room King's Acre Pippin will keep until the middle of May. The growth is fairly compact and fruit is borne with regularity.

NEWTON WONDER is usually considered a culinary variety, but it has excellent dessert qualities. From January until the end of May it is in the right condition for use. It is undoubtedly a handsome Apple. The shape is globular and it is beautifully striped with red on the sunward side. The growth is clean, of the right vigour and fertile. Newton Wonder appears to succeed equally well grown as bush or standard.

I am certain that the possibilities of the variety LORD HINCHIN have not been properly explored. In my opinion it is not excelled by any other late Apple. The firm flesh of the fruit has a most acceptable flavour. I have kept it in good condition until July. The tree makes drooping growth. Sometimes fruit buds occur on the tips of the shoots, after the manner of Irish Peach. At other times spurs must be formed by the well known method of pruning.

STURMER PIPPIN has an unattractive appearance and a splendid flavour. Such a combination is regrettable. If the eating qualities of Sturmer Pippin were inside the gorgeous skin of Worcester Pearmain the variety would be a tremendous power on the market at this season of the year.

As it is, commercial growers are wise to avoid "Sturmer." It cannot command true value on the market. In private gardens, however, where appearance is not so important, the variety should be grown. It will keep until the end of June and the flavour is delicious. The season must be well advanced before the fruit is gathered or it will shrivel. It is not possible to name a date for seasons vary greatly. Unless autumn gales cause bruising, the fruit should hang, however, until most of the leaves have fallen. The tree is very compact so that the variety is very useful for the small garden.

A variety which originated in the Coventry district in the eighteenth century is now known as WYKEN PIPPIN. Though so old, it is accounted an excellent dessert Apple. I cannot describe its appearance as very attractive, but it is comely. It is a medium size and somewhat flattened in shape. The colour is yellow and the flavour most satisfying. Fruit is produced with regularity on a shapely tree.

Shall I incur criticism, I wonder, by writing that LANE'S PRINCE ALBERT is worthy to be classed as a late dessert Apple? There are many better varieties it is true. It is equally true that there are many infinitely worse. The appearance of "Lane's" is in its favour for commercial purposes. A pale yellow, slightly flushed skin is shown by well grown fruits. There can be no doubt about its keeping properties. May is well advanced before it passes out of season. The regularity with which this variety bears is proverbial. Apple prospects are nearly hopeless if it fails. A weeping slender form of growth is characteristic.

The varieties about which I have written are the cream of the late keepers. Many skilled and patient hands are toiling to raise more. May their labours be crowned with success. I have often wondered why there should be so many early varieties of the Apple and so few late ones. The Crab is the first parent of all cultivated kinds. It is ripe in late autumn and can be kept in good condition only until January. Perhaps our difficulty lies there. GEO. H. CORLEY.

SIR HERBERT MAXWELL ON BULBS

A LECTURE on Hardy Bulbous Plants was delivered by Sir Herbert E. Maxwell, Bart., at a recent monthly meeting of the Glasgow and West of Scotland Horticultural Society, at which Mr. John Cairns presided.

Sir Herbert at the outset pointed out the difference between a true bulb, such as that of the Snowdrop or Daffodil, and a corm, such as that of the Crocus, and he described the characteristics of a number of plants belonging to both groups. In referring to the different species of *Narcissus* he said that the ease with which they could be grown in British gardens seemed the more remarkable because, being mostly natives of Southern Europe and North Africa, they encountered in Britain different conditions of soil and climate. Probably no genus of flowering plants lent itself so generously to cultivation and was so little liable to disease. In a passing reference to the Dutch Crocus, he said that these were poured into this country in millions every autumn. They were chiefly cultural varieties of *Crocus vernus*, and gorgeous as were their blossoms, in his judgment they were no improvement on the species as it grew wild. He did not share the view of some amateurs that increase of size or blossom meant increase of beauty. The lecturer described true Lilies as a family of plants with which greater difficulties have been encountered and more frequent failure incurred than with any other kind of bulbous plant. It was a mournful fact, he said, that of the immense consignments of bulbs of the finer Asiatic species that reached this country every year, and the less abundant species imported from America, only a trifling percentage came to any good with us. They might flower once from nutriment stored within the bulb, but very few survived a second season. If only 5 per cent. of the Lily bulbs imported annually were to flourish and increase in this country, British gardens would by this time present a display in summer realising the dreams of the most sanguine amateur. A much larger percentage ought to survive provided (1) that better care were to be applied to raising and packing the bulbs, and (2) that their wants on arrival should be better understood. For instance, *L. auratum*, the golden-rayed Lily of Japan, was capable of flourishing permanently under British conditions, as had been proved by instances that had come under his own observation. Unfortunately, Japanese growers in their anxiety to take advantage of a profitable market had over-propagated this Lily and forced its cultivation on ground without rotation of crops. This probably accounted for the great majority of bulbs which arrived in this country being infested with a deadly fungus or by swarms of root mites. He thought it was high time that the leading horticultural societies such as theirs should take this matter up and urge on the Government the need for imposing restrictions on the importation of plants and roots calculated to carry disease.

The lecturer then gave the names and a few of the outstanding features of about a dozen varieties of the Lily family with which he said any amateur might deal with the best prospects of success. They are *L. giganteum*, *L. monadelphum*, *L. testaceum*, *L. croceum* (Orange Lily), *L. regale* (Royal Lily), *L. Sargentii* (Mrs. Sargent's Lily), *L. dauricum* or *umbellatum*, *L. Martagon* and *L. pyrenaicum* (Turk's Caps), *L. tigrinum* (Tiger Lily), *L. pardalinum* (Panther Lily), *L. superbum* and *L. chalcidonicum*.

GARDENING OF THE WEEK

FOR SOUTHERN GARDENS.

The Hardy Fruit Garden.

American Blight.—This is also known as woolly aphid, and it is easily recognised by the cotton-wool-like appearance on the branches of Apple trees. It is fairly common, and if allowed to increase will soon cause the trees to become unhealthy; but, happily, it readily responds to treatment. Directly it is seen, a little methylated spirit should be applied with a stiff paintbrush. Such work must be done throughout the summer whenever the pest appears.

Apricots.—These are about the first to need disbudding, but if the weather is very cold such work should be left until more congenial conditions prevail. Apricots should not be disbudded so severely as Peaches and Nectarines, and when the work is carried out it must be borne in mind whether the tree is a young one or if it has filled its allotted space. With the former, allowance must be made for extension and to see that the space is well furnished with healthy shoots. All badly placed shoots should be removed, such as those growing behind the branches and any that may be at right angles with the front or face of the tree. The main shoots should be carefully tied in along with other well placed growths to form a good foundation. With old trees the disbudding is much the same, but some of the growths that are not required for tying in may be pinched at the fourth leaf with the object of producing fruit-buds. Disbudding should be carried out gradually.

Fruit Under Glass.

Vines.—The general routine in the vineries will be tying and pinching the shoots, while the thinning of the berries will also require attention. At this season ventilation will need careful regulation so as to prevent the foliage being scorched and to avoid cold currents of air passing among the rods. Sudden bursts of sunshine are often responsible for the scorching of the young shoots, while it sometimes happens in the morning if a little top air is not admitted sufficiently early. The atmosphere should be kept moist, and if at all dry the floors may be damped down in the morning when the temperature begins to rise and again in the afternoon about three o'clock when the ventilators are closed. The watering of the borders should receive attention, but when this is necessary it ought to be done thoroughly and tepid water used. Vines that may be swelling their fruit may be assisted with liquid manure from the farmyard diluted to the colour of straw, or some fertiliser may be employed, but this must not be overdone. A light sprinkling over the border if watered in will usually suffice. Any watering should be done early in the day when the maximum amount of ventilation is afforded. The border may also be mulched with cow manure or the manure from an old mushroom-bed.

The Kitchen Garden.

Potatoes.—The main crop should be planted in lines 2ft. or 3ft. apart and 18ins. between the "sets," while each tuber should be about 6ins. deep. If the ground is of a heavy nature, a trench may be dug out with the spade, but on light soils the dibber may be employed.

Salsafy is held in high esteem by many, and seeds may be sown from now till the end of May, but to secure straight roots of fine quality the ground should be in good heart. Recently manured soil is not advised, but if a piece has been trenched, with manure placed at the bottom of the trench only, then Salsafy will succeed. Sow the seeds in lines 15ins. apart and thin the seedlings to 6ins.

Onions.—Plants raised in heat early in the year will now be ready for planting out, but care must be taken to see that they are well hardened off before transplanting them. The site, having been previously prepared, will only need a light forking over, and, at the same time, a dressing of soot, or ash from the rubbish fire. When the surface is dry enough rake it over and then place the seedlings in lines 15ins. apart and 12ins. between the plants. The planting must be done carefully and the roots made quite firm in the soil. If the weather is dry, an occasional sprinkling of water will be needed until the plants are re-established.

The Flower Garden.

Lobelia fulgens.—The varieties of this showy Lobelia are generally lifted in the autumn and stored in a frost-proof frame, and where this was done the present is a suitable time to divide

them. Pot up the various pieces and plant them out towards the end of May. They succeed admirably in a bog if it is not too wet.

Pansies.—Seed may be sown in pans of light soil and then placed in a warm greenhouse until the seedlings appear. When they are pricked off a cold frame will suffice, and, finally, they should be transferred to a partially shaded spot where the soil is fairly rich. Seed may be sown in the open ground a few weeks hence.

Annuals.—Many annuals are sown in the open border where they are intended to flower, but to be a success the seed must be sown thinly and the seedlings thinned to a reasonable distance. Mignonette and suchlike should be sown at intervals of a few weeks to keep up a continual display.

T. W. BRISCOM.

(Gardener to W. R. V. saght, Esq.,
Castleford, Chesham, Gloucestershire.)

FOR NORTHERN GARDENS.

The Kitchen Garden.

Peas.—Continue to make fortnightly sowings of mancrop varieties. Stake the various sowings as soon as they have made in. or 2ins. of growth above ground. If the stakes are rather bare at bottom, work in some dwarf twiggy branches to carry the plants up, as it is in the earlier stages of their growth that support is most essential. Draw a little soil up to the plants before commencing to stake.

Asparagus.—This is the best time to make new plantations. The ground should be trenched to a minimum depth of 3ins., and it is of great advantage to place a foot or so of some open material, such as the stems of herbaceous flowers or stems of the Cabbage tribe at the bottom. If the soil is at all heavy, a proportion of clean sand or vegetable mould should be incorporated with it, also a good dressing of farmyard manure, and if seaweed is procurable, a dressing of it will be of great value, as Asparagus is a salt-loving plant. Beds 4ft. wide with a 15in. alley between will accommodate three lines, the plants being allowed a distance of about 6ins. in the line. The young plants should be out of the ground as short a time as possible, and even during the brief period their roots should be protected from the air and light. The alternative plan is to sow seed now a few inches apart in the prepared beds, thinning out the plants in due course. This means a year's delay, but some light crop, such as salad or stump-rooted Carrots, may be grown between the lines this season.

Fruit Under Glass.

Melons planted a week or two ago will be growing away freely. Tie and regulate the shoots as the plants develop, but do not fertilise any female blossoms until four or five can be secured simultaneously, as flowers fertilised only three days after others are almost certain to prove abortive. Maintain a minimum temperature of 65°. Do not make use of the syringe during the flowering period till the fruits set.

Vegetables Under Glass.

Tomato plants swelling their fruits should be fed with a mild stimulant twice a week. Stop the plants when they have attained a height at which the growth becomes weak.

The Flower Garden.

Sweet Peas.—If the soil is in good condition, no time should be lost in getting Sweet Peas planted. Those who have potted up the plants four or five in a pot should plant the groups intact about 15ins. apart, and those who have potted them up singly should plant them 1ft. apart. Plants grown on in lines in boxes should be planted singly from 6ins. to 12ins. apart, according to whether they are required for general decorative purposes or with a view to the production of flowers of exhibition standard.

Hardy Annuals.—Seed may now be sown outdoors with safety. Annuals may be used with good effect in clumps or in drifts in conjunction with hardy herbaceous flowers, or they may be used for filling whole beds in a geometrical design. Care should be taken not to sow too thickly, especially with the stronger kinds, such as Lavatera, varieties of Clarkia elegans and Godetias. In sowing, rake the ground smooth and scatter the seeds on the surface and rake the surface smooth.

Rock Plants.—The majority of these bloom during April and May. Planting operations may

still be carried out without risk of failure. All weeds should be dealt with promptly, and it is attended to during the next few weeks they will give comparatively little trouble during the summer months.

CHARLES COMFORT.

(Formerly Head-gardener to Mrs. Haig, Broomfield, Davidson's Mans, Midlothian.)

GREENHOUSE AND CONSERVATORY.

Plumbago capensis and its white variety have long been favourite greenhouse plants, either for growing in pots or for planting out to furnish pillars or ratters. Plants cut back and started into growth some time ago should now give a supply of cuttings, which will root readily in a slightly heated case. Rooted at this time they make nice little plants in 48-sized pots for autumn flowering and, of course, should be kept for growing on next year.

Ceratostigma Willmottiana, although hardy in warm, dry situations in the South, is well worth growing as a pot plant for the cold greenhouse. Outdoors it is apt to get cut to the ground with frosts, but with the shelter of a cold house it preserves its shrubby habit, and it is a very graceful plant, making a number of slender, freely branching shoots. It can be readily propagated by means of half-ripened shoots, which root freely in a close case in a cool house. The newer *Ceratostigma Griffithii* should be tried in the same way.

Deutzia gracilis is an old favourite for forcing purposes. The plants, as they pass out of flower, should have the old flowering wood cut out and thus encourage strong young shoots for next year's flowering. Grow the plants on in a cool house until growth is completed. They should afterwards be stood outdoors for the summer months, receiving attention as regards watering and feeding. If it is desired to increase the stock, cuttings should be put in now, as the young shoots from pot-grown plants root very readily at this time. Later on, such young plants should be planted out in the nursery garden, where they will make strong growth and in due course may be potted up for forcing.

Chorizemas as they pass out of flower should be slightly pruned. These plants are somewhat impatient of hard pruning. When grown in pots their long, slender shoots are easily trained round suitable supports, and by this means one can soon obtain large specimens. They are, however, seen at their best when planted out in a well drained border in a cool house, where they soon make large specimens. These plants may be propagated at this time by means of twiggy half-ripened shoots, inserting the cuttings in pots of sandy peat and standing them under bell glasses in a cool house. In their younger stages they should be pinched frequently so as to build up a good foundation for the future plants.

Platytheca galioides is another beautiful plant which is by no means common in our conservatories at the present day. It is a very slender, graceful plant with thin, wiry stems, and requires frequent stopping in its younger stages to induce a bushy habit. It succeeds best in compost of good fibrous peat with a little light loam and sand added. It may be propagated in the same way as advised for Chorizemas. This plant is not by any means easy to propagate and grow successfully, but, like many other beautiful plants, is worth a little extra trouble.

Aotus gracillima is another fine plant with numerous small pea-shaped flowers, produced in long, slender, drooping shoots, the flowers being yellow with a brown blotch. It is readily propagated at this time by means of small, twiggy shoots which root freely in light sandy soil, standing the pots under bell glasses in a cool house. This plant is seen to best advantage when trained as a standard some 3ft. high. For this purpose the young plants should be stopped once, and two or three of the strongest shoots tied up to a stake until the desired height is reached, when the tips should be pinched out. After flowering, the shoots should be pruned hard back, the plants being kept slightly closer and warmer until they break into fresh growth.

Reinwardtia tetragyna and *R. trigyna*, more generally known as Limons, are very old garden plants which are very useful for winter flowering. Their beautiful yellow flowers are very attractive during the dull days. These plants should be propagated at this time by means of young shoots, which root readily in a close case. They must be grown under perfectly cool conditions. They are very subject to attacks of red spider, which may be prevented by a free use of the syringe.

Royal Botanic Gardens, Kew.

J. COATES.

SALADS AND SALADINGS

ENORMOUS quantities of salad plants are sent to Covent Garden and also to all the provincial markets throughout the British Isles. We know quite well that the French gardeners are expert cultivators of all kinds of salad plants, and in sending them to market in a proper way—by this I mean in carefully packing and grading the produce, which is an important item if the best prices are to be obtained. I have seen in London in some of the West End shops, Cos Lettuce at 9d. and 1s. each, in the early spring months, that were beautifully blanched and crisp, which makes all the difference in making a good salad or a bad one; and it is a remunerative crop to grow.

Lettuce is one of the chief ingredients for the salad-bowl, and to obtain nice tender crisp plants must be grown quickly and without receiving any check. To do this the ground should be deeply dug, in the autumn for preference, and be given a good rich dressing of decayed manure. Choose a warm south border for the seed-bed, and sow in shallow drills from 6ins. to a foot apart from the middle of March, and at intervals of a fortnight or so, till well into June. When the plants have made three or four leaves they will require transplanting out, leaving the others in the seed-bed at about 6ins. to 8ins. apart for Cabbage varieties; planting those taken up the same distance apart, and about 6ins. from row to row. Take them up carefully with a small ball of soil attached—the trowel is the best tool to work with—so that they do not receive any check by removing. If the soil is dry they should be watered in, and not allowed to become dry at any time during their growth; also keep the soil between the rows hoed frequently, which will keep the weeds in check and be most beneficial to the plants. Slugs are a very troublesome pest to these young plants, but if the plants are dusted over with a little lime and soot in the early morning or evening it will keep slugs in check and will assist the growth of the plants. Cabbage varieties are the earliest to mature, and for early spring sowing Tom Thumb, a miniature variety, is very early, heart compact, bead firm and white, crisp and of good quality. Early Paris Market is another reliable early sort, and if one of these two varieties be sown at the same time as All the Year Round, this latter will form a succession, as it takes a little longer to come to maturity, but it is of fine flavour, crisp and tender. May King is another splendid sort, forming nice solid heads, and is equally good either for frame culture or outside.

Cos Varieties.—I think Cos Lettuces are far more appreciated than the Cabbage varieties by most people. To get these early in the spring they should be taken up from the ground about the second or third week in October and be planted out in cold frames in good rich soil in rows a foot apart and the same distance from plant to plant. Give plenty of air when the weather is favourable; when very frosty, they should be covered either with mats, long litter or dried bracken, always keeping the soil between the plants well stirred. Early in March they should be growing nicely and will require plenty of water at the roots and overhead. To each one with a piece of straw, so as to blanch it, and they should be ready for cutting towards the end of the month, or perhaps earlier if the season is suitable. Hardy Winter White is a most excellent sort, crisp, and very slow to run to seed. Bath Black Seeded is another good old variety, very tender, and of nice nutty flavour. These two are the most reliable sorts to grow for early spring use. Balloon

Cos is a good summer Lettuce and blanches well without tying up. On good rich soil this variety will grow to immense size and is very crisp and sweet. Carter's Giant White Cos is a great favourite with many people; it forms large compact heads, self folding, of exquisite flavour, and does not run to seed so quickly as other Cos varieties. The Cos Lettuce should have plenty of space to grow, not less than a foot apart each way, a little more if it can be spared, and be given a deeply tilled soil. From June to the latter part of August we often get very hot weather, and then salads are required almost daily. The best plan is to sow seed on a north border in the latter part of May. The plants from this sowing can be grown between the rows of other vegetables, such as Peas, also on Celery ridges; the latter is an ideal position. Grown in this way, the other crops shade them from the strong sun. If the winter has killed the plants that were sown last autumn no time should be lost in sowing one of the early Cabbage varieties which I have mentioned. If sown in a box and placed in a cold frame they will soon make nice plants for the outside garden. Harden them well by giving abundance of air on every favourable occasion before finally planting them out. I have to consider all kinds of methods to get a good supply of salads almost all the year round, as to keep up a supply for between eighty and a hundred people requires some little forethought. I have missed mentioning one Cabbage Lettuce, and that is Sutton's Ideal. This is a splendid variety of good size, heart compact, leaves slightly tinged with red, and stands a very long time before running to seed.

Endive is a most useful companion to Lettuce and cannot be done without, for in the autumn, winter and the early months of the year it is a most valuable salad plant. To obtain good specimens, seed should be sown about the first week in July, and the last sowing made in August. The plants should be fully grown by October; after the latter month they do not make much growth. If a cold frame is available they should be lifted with good balls of soil and planted in it, keeping the lights off by day when the weather is fine, putting them on at night in case of rain or snow, for Endive dislikes being damp at that season of the year. In case of very hard frost the glass should be covered with litter or bracken. Where cold frames are not available for putting the plants in, they may be shielded in the open garden, where they have grown, by placing over each plant an inverted flower-pot or wooden box. By this latter method I have kept Endive for quite a long time. Endive is always tough and stringy if it is not properly blanched, and this can only be done by tying each plant up and keeping it in the dark. There are about a dozen varieties of Endive, but it is quite unnecessary to grow more than two sorts. The best are Improved Round-leaved Batavian and Green Curled; the former variety is the one chiefly grown. This salad plant requires about the same treatment as that given to Lettuce. Good rich soil and plenty of moisture at the roots when at all dry, while frequent hoeings between the plants will prove beneficial.

Cucumbers are appreciated by most people especially when they first come in, and to have them in perfection it is essential that they should be grown in a warm house or heated pit where a night temperature of 65° can be maintained. They delight in a little bottom-heat, made up with fresh leaves and long manure mixed together, three parts leaves to one part

manure, if the latter cannot be had, all leaves will answer the purpose, and the heat will be more lasting. The soil should be turfy loam, half decayed leaf-soil and old horse manure, mixed and placed in billocks ready for putting the plants out, keeping the soil light and not beating it down too firm, as the Cucumber likes to run its roots about the soil. Little air need be given to the house, providing plenty of water is thrown about the paths and stages two or three times a day in hot sunny weather, and the plants kept well syringed, which will keep down green fly and red spider. These are two most troublesome pests to the Cucumber, and mildew sometimes will appear on the foliage after a spell of dull weather, but if dusted with sulphur when it is first seen that will check it. Plenty of water must be given to the roots, and weak liquid manure occasionally will be most beneficial. There are many varieties, but if a good strain of Telegraph or Lockie's Perfection can be got they take some beating.

Ridge Cucumbers.—In favourable situations Ridge Cucumbers may be grown without any assistance in the way of bottom-heat beyond that supplied by the sun; but an early start, provided no sacrifice is made of health or vigour, means early production. I am not much in favour of putting plants out that have been raised in strong heat, but I do admit that the seeds must be sown in small pots and germinated in a warm house, close to the glass to prevent them from growing up weakly. There is no reason why they should not thrive and do well if properly hardened off before being planted out in their permanent quarters. A hand light, bell glass, or long flower-pot placed over them for a few nights until they become established will assist them considerably. These Ridge Cucumbers are very nice mixed with other salads, although a little coarser than those which are grown entirely under glass. Sutton's King of the Ridge and Long Green are two of the best varieties to cultivate. They grow quite straight and are from 12ins. to 15ins. in length; they partake of the characteristics of a frame Cucumber.

Radishes.—It is necessary that some pains should be taken to ensure a free and moist root run on well enriched ground if Radishes are to be grown to perfection. It is customary to sow these and other saladings indiscriminately on any piece of ground which is vacant. This is rather a mistake, as the soil, having been partly exhausted by a previous crop, and being, perhaps, lumpy and sour, is in a very unfit state for the reception of the seed. Choose a piece of ground in the late autumn and trench or dig it deeply, adding decayed manure and lime; then leave it for the winter frosts to sweeten it, when in the early spring it will rake down nicely and be in good heart for receiving the seed. Sow very thinly in broad, shallow drills, or broadcast; perhaps the latter method will be preferable. The latter part of February, or first week in March, is a suitable time to make the first sowing outside, and continue at intervals till September or October. It is from the beginning of June onwards up to the end of August that the greatest difficulty is experienced in getting tender Radishes. Cool and moist ground should be given in these particular months, and the plants should have copious supplies of water whenever they need it. I usually sow Wood's Early Frame at the end of December or early in January, on a mild hot-bed in a double-lighted frame, to get them early, and follow on outside with French Breakfast, Sparkler and Scarlet Olive. Some people prefer a few Radishes cut up in the salad; used in this way they make the salad look more tempting.

Popular Hardy Flowering Plants & Alpines

FOR PRESENT PLANTING.

We offer a large stock of well grown plants, including specially good value in the following:

The ATCO MOTOR MOWER

The most efficient Mower on Earth.

The Expert's preference for the "Atco" is due to his knowledge that the "Atco" gives efficient and complete service at minimum cost. In no other motor mower are to be found the many "Atco" inventions essential to mowing efficiency. No other motor mower attains the "Atco" standard, and none has the same experience behind it.

APPRECIATIONS.

"I have had the 'Atco' Mower since June, 1921, and have cut over half an acre a week in the season. . . . The condition of it is equal to new and I would not be without it at treble the cost."

A Openshaw, Esq.

"Your Mower gives me every satisfaction, and with it a boy does the work easily of a man, boy and pony combined."

J. B. Clarke, Esq.

"My lawns are extensive, with some steep slopes down to the river. From being a constant source of worry your 'Atco' has made them a pleasure. I have now had the 'Atco' in use for two summers."

Sir Grey H. D. L.
Slipworth, Bt.

The "ATCO" Turf Cultivator

(illustrated) aerates the roots, destroys plantains, daisies and other fleshy-leaved weeds, levels turf, loosens and collects moss, makes coarse grass fine. It can be affixed only to the "ATCO" Motor Mower.

The ATCO LAWN EDGE TRIMMER

An Exclusive 'ATCO' Invention

Before putting it on the market, its efficiency, accuracy and reliability have been perfected in actual use under all normal conditions.

It gives a straight edge by the actual continuous 'shears' action, working with great speed and simplicity.

"Look at his garden!"

Yes, look at it.

Did you ever see a finer show for this time of the year?

How is it he gets a profusion of early blooms weeks before anybody else? Why is it that his vegetables and fruit trees never seem to fail?

He looks after the soil—strengthens it with ECLIPSE Fish Manure. Plants want nourishment—food as well as water—and few soils contain all the nourishment required. ECLIPSE Fish Manure enriches the soil—gives you hardy plants, deep-coloured blooms, and a garden flowering continuously nearly all the year round.

Eclipse
FISH MANURE
Makes poor soil good & good soil better.

ECLIPSE Fish Manure contains Phosphates Nitrogen and Potash, in their proper proportions. Being largely organic, it supplies humus to the soil.

THE HUMBER FISHING & FISH MANURE CO., LTD., 9, Stoneferry, Hull.

Chicory.—A few rows of Chicory should always be grown, as it is a most useful salad plant in winter and early spring. The only fault with this salad is that it has rather a bitter taste that is not appreciated by everyone. If it is sown during May in drills, and thinned out in the rows to six inches apart and kept clean, it will be ready for taking up in October or November, when the roots can be stacked up by the side of a south wall, planted in dryish soil, and be covered over with a wooden framework to exclude light. It will soon push forth beautiful blanched leaves that can be used either as a vegetable or in the salad. Witloof and Christmas Salad are two of the best sorts to grow.

Mustard and Cress.—Although not required in such large quantities as Lettuce and Endive, this is very useful for winter and early spring. Its cultivation is so simple and well known that it does not require any further notice than to say that at all times of the year it should have a rich

soil, which not only grows it much crisper, but less hot and pungent.

Dandelion when nicely blanched and mixed with the salad is very wholesome. The Improved Broad-leaved Dandelion is superior to the old form of this common weed. Seed if sown now will furnish strong roots for next winter's forcing, when it can be blanched like Endive or Chicory.

Corn Salad or Lamb's Lettuce.—This is not largely used in this country, but, I believe, on the Continent it is cultivated to some extent. It makes a very good change in the salad-bowl. It about three sowings be made—the first in February, the second in April, and the third in September—a fair supply can be maintained throughout the year. The ground should be deeply dug, not heavily manured, and the seed sown in drills six inches asunder, the plants thinned out to six inches apart in the rows. In very severe frost a covering of litter will protect them from any harm. J. W. BIRKINSHAW.

GROWING MELONS AS CORDONS

IT is quite twenty-five years since I first, with many other cultivators, began to grow Melon plants as cordons. There are still numbers of cultivators who grow the plants in the old way with many branching shoots—practically on the extension system. It is not for me to say that such cultivators are wrong, as I know that many experts manage to secure very heavy crops from plants grown in the latter way; but I am quite sure that the great majority of amateur cultivators would be more successful with cordons and grow more and finer fruits. In my own case I found it a difficult matter to get more than an average of four fruits to set and swell to maturity on each plant, and as the latter were grown about 4 feet apart, it did not require many to fill one side of a Melon-house 30 feet long. I used to ripen about thirty nice fruits from each batch of plants, and was not satisfied with the crop. Then we adopted the plan of planting cordons, having about thirty in the same space and securing ninety fruits. Melon seeds are plentiful; it is easier to attend to thirty cordons and train them than to seven plants grown on the extension system. I grow Melons in frames on hot-beds, also as cordons. Briefly, the work is carried out as follows:

Making up the Hot-bed.—Littery manure fresh from the stables should be secured, laid out thinly on the floor of an open shed and be turned every other day for one week. To one barrow-load of this prepared manure add one peck of sweet tree leaves gathered the previous autumn. Mix all thoroughly, and build up a nice firm bed about 3 feet in depth when well trodden down.

The Soil.—Fibrous loam, rather heavy in texture, is the best. The grass portion must be quite dead. When able to procure such loam I never add any other ingredients to it at the start. With the loam cover the surface of the bed (whether in glass-house or frame on a hot-bed) to a depth of 3 inches, but near the front of the house, or in the centre in the case of a frame, form a ridge of soil 6 inches deep and 18 inches wide. On the ridge plant the young Melon plants 14 inches apart. The soil must be in a medium state of moisture and be pressed down firmly.

Planting and Training.—Plant the young Melons when the soil is nicely warmed; press the soil firmly round the roots, but do not bury the stem nor bruise it. Apply water with care, maintaining the soil in a medium state of moisture; the soil quite near the stem of the plant should be drier than any other. Train the main stem

to a stake or the wires till it has grown about 3 feet 6 inches in length, then stop each plant; side shoots will now grow more rapidly and these, in turn, must be stopped at the first joint beyond the young embryo fruit. Usually it is possible to have three or four young fruits with their flowers open at the same time, and they must be "set" forthwith.

How to "Set" Melons.—The following hints will be useful to the inexperienced cultivator: To set the fruit a staminate (male) flower should be taken, and, after removing the petals, insert the stigma in the centre of a pistillate (female) bloom; that is, the one with an embryo fruit attached. About noon when the sun is shining is a good time for this work to be done and when as many female (fruit) flowers as possible can be found open at the same time. All young growth beyond the main stem, main leaves, side stems and the main leaves on the latter must be pinched off while quite small.

General Work. Melons thrive in a nice heat—summer heat—and moisture in the atmosphere while growth is active. As the roots show on the surface apply a top-dressing of rotted manure and loam in equal proportions. Thin layers frequently applied are better than one thick layer. Diluted liquid manure is beneficial; also concentrated manures applied according to directions given with them.

The Ripening Fruits must have more air and less moisture in every way, although it is a mistake suddenly to stop the supply of water. Some atmospheric moisture on very hot days is beneficial, and the plants must have enough at their roots to prevent the leaves flagging. Plants in frames require less moisture than those grown in houses. Furthermore, it will be necessary to fix nets under depending fruits, when half grown, to afford them support. GEORGE GARNER.

FORTHCOMING EVENTS.

April 17. Winchester Horticultural Society's Meeting.

April 18. The Midland Daffodil Show, to be held at Birmingham (two days).—Huntingdonshire Daffodil Society's Meeting.

April 19.—Manchester and North of England Orchid Society's Meeting.

April 20.—National Rose Society's Spring Show, to be held at the Royal Horticultural Society's Hall, Vincent Square, Westminster.

Exhibitors and a Hospital.—Readers may be interested to know that Messrs. Pulham and Son have handed to the Governor of the Middlesex Hospital a cheque for £28 2s. 6d., being the proceeds of the sale of postcards illustrating their exhibit (Princess Mary's Garden), in the Annexe, at the recent Ideal Home Exhibition at Olympia.

Presentation to Mr. Alexander Dewar.—Mr. Dewar, who has retired after many years honoured service as head-gardener to Mrs. Mann Thomson, Dankeith, Kilmarnock, was visited upon by a representative deputation at his home and made the recipient of a handsome testimonial from his fellow horticulturists and other friends in the district. Mr. Melville, head-gardener at Cambusdoon, Ayr, in handing over a well-filled wallet of treasury notes, referred to the prominent position Mr. Dewar held in the horticultural world, to the valuable services he had rendered in connexion with flower shows in the district and to the high esteem in which he was held by all who knew him. Mr. Dewar, in thanking his friends for their thoughtfulness and handsome gifts, referred to the many happy years he had spent in the pleasurable pursuit of horticulture and the many changes which had taken place during the last forty years in garden designs and fashion. Mr. A. J. Ferguson, in handing over several articles in silver to Mrs. Dewar, alluded to the generous hospitality she had always extended to visitors at Dankeith. He trusted that both Mr. and Mrs. Dewar would be long spared to each other, and that they would have every comfort and happiness in the evening of their days.

ANSWERS TO CORRESPONDENTS

QUESTIONS AND ANSWERS.—All communications should be clearly and concisely written on one side of the paper only, and addressed to the EDITOR OF THE GARDEN, 20, Tavistock Street, Covent Garden, London, W.C.2. When more than one query is sent, each should be on a separate piece of paper. Plants for naming should be clearly numbered and securely packed in damp grass or moss, not cotton-wool, and flowering shoots, where possible, should be sent. It is useless to send small scraps that are not characteristic of the plant.

ROCK GARDEN.

ROCK PLANT (E. G. P., Surrey).—The correct name of the plant is *Mazus reptans*, *M. rugosus* being a small-flowered annual. *M. reptans* is not particular as to position, and a sunny or half-shady place will meet its requirements. It likes plenty of moisture when growing and should be planted in a mixture of good turfy loam, leaf soil and sand. *Convolvulus mauritanicus* does best in a sunny position, planted in loamy, well drained soil. A ledge of the rock garden is an ideal place, where the flowering shoots can hang down in a natural manner. It is not quite hardy and would need protection in winter. Cuttings, however, strike readily in summer if inserted in sand in a close frame or under a bell glass. Seeds also are produced freely.

TREES AND SHRUBS.

CYDONIA JAPONICA UNSATISFACTORY (W. T. D.).—Since the tree was planted the weather, generally, has been cool, and there has been no great sun heat either. As the plant occupies a north-west aspect on the wall, flower buds have not been formed. A quite normal summer would have a very beneficial effect on the plant. We advise our correspondent to leave it where it is this year, then replant in the more sunny position next winter if flowers fail again; this plant should be well watered in dry weather. Remove some of the surface soil, haring the roots, and replace with some of a fairly heavy nature, making it moderately firm. Do this now and cut away all dead branches to sound wood.

MISCELLANEOUS.

HOW TO DESTROY WOODLICE (M. R., Salop).—Potatoes cut in half and hollowed out should be placed near the infested spots with the hollow side downwards. The woodlice will shelter and feed in these, and those attracted may be killed by dropping them into hot water.

NAME OF PLANT.—R. J., Coldstream.—*Nuttallia cerasiformis*, "Oso Berry."

Rich coloured
blooms in your
garden.

Lovely blooms all
over your plants;
rich luscious fruits
for your table;
juicy vegetables

for the kitchen—don't you want them?

They'll grow in your garden if you look after the soil.
Rich soil produces rich blooms; poor soil naturally
starves your plants. If your garden hasn't been a
magnificent show, here's the reason. And here's the
remedy too—ECLIPSE Fish Manure to enrich the soil.

ECLIPSE Fish Manure contains
Phosphates, Nitrogen and Potash
in their proper proportions. Being
largely organic it supplies humus
to the soil.

PRICES:

7lbs. 14lbs. 28lbs. 56lbs. 112lbs.
2/6 4/- 7/- 12/- 24/-

Obtainable from all the leading
Seedsmen, or if sent by rail 1-lb. per
package to be added towards
carriage.

Lilies, hardy Tiger, double or single, 3, 1/6. **Lily of the Valley**, strong flowering crowns, 6, 1/6. **Linum** perenne, beautiful blue Flax, 6, 1/6. **Linaria** dalmatica, spikes yellow, blotched red, 6, 1/6. **Lobelia** cardinalis, spikes rich scarlet, 4, 1/4; Queen Victoria, claret foliage, 3, 1/6. **Lupin**, Tree, yellow or white, 3, 1/6; polyphyllus, large spikes, blue, white, etc., 6, 1/4; roseus, lovely pink flowering, 4, 1/4. **Lychnis** chalcidonica, scarlet Jerusalem Cross or New Salmon Queen, 3, 1/6; coronaria, silvery foliage, crimson flowers, 6, 1/6.

Malva moschata, musk-scented, very showy, pink or white, 4, 1/4. **Mimulus** cardinalis, hardy scarlet Musk, forms large bush, 4, 1/4. **Monarda** (Fragrant Bergamot), new Cambridge Scarlet, 3, 1/6. **Montbretia**, spikes, brilliant colours, 12, 1/9. **Onopordon**, tall, very handsome Thistle, 3, 1/6.

Pansies, best large-flowering exhibition varieties, 12, 1/6; separate colours for bedding, blue, white, yellow, red, purple, golden, 12, 1/6; Coquette de Poissy, charming for bedding, lovely rosy mauve, 12, 1/10. **Papaver**, Oriental Queen, Salmon Queen, Apricot Queen, 3, 1/6; orientale, crimson and scarlet, 6, 1/6. **Pentstemon**, large scarlet Southgate Gem, Middleton Gem and large Excelsior strain, 3, 1/6; gentianoides, blue shades, 6, 1/6. **Periwinkle**, large blue, 4, 1/4. **Pæonies**, lovely new double and single Japanese varieties, all colours, mixed, 3, 1/6; larger, separate colours, 9d. each, very large, 1/- each. **Pulmonaria**, Jerusalem blue Cowslip, very rare, large plants, 1/- each. **Pea**, everlasting, red, white, pink, 3, 1/6. **Physalis**, giant Chinese Lantern, 6, 1/6. **Pinkie**, old-fashioned fragrant double white, 6, 1/6; Mrs. Sinkins, 3, 1/6; double, semi-double and single, all colours, very fragrant, 12, 1/9.

Potentilla, double, crimson, 4, 1/4. **Primulas**, lovely hardy varieties for borders, rockeries, bogs, assorted, 4, 1/4; larger, 3, 1/6; very large, in bud, 1/- each. **Polyanthus**, best large flowering, one year old plants, 6, 1/4. **Primrose**, blue and purple shades, 3, 1/6. **Primula** denticulata, large heads, lilac; rosea, very bright pink; cortusoides, rosy purple; japonica, large heads, rich colours; cashmeriana, large purple heads; pulcherrima, rich crimson flowers on stout stems; 3, 1/6; larger, 2, 1/6; sikkimensis (Himalayan Cowslip), sweetly fragrant pale yellow flowers, loves shade and moisture, 3, 1/6. **Phlox**, large flowering, best named, all colours, 3, 1/6; verna, dwarf creeping alpine for rockery, bright pink, 3, 1/6. **Pyrethrum**, Kelway's hybrids, 4, 1/6. **Perennial Sunflowers**, Miss Mellish, rigidus, 6, 1/6. **Pyrethrum**, double pink, white, crimson, large clumps, 2, 1/6; James Kelway, large scarlet, 2, 1/4.

Rose Campton, bright crimson, 6, 1/6. **Rudbeckia** New-mani speciosa, 3, 1/6; Golden Ball, large double, 3, 1/6.

Salvia argentea, strikingly beautiful silvery leaves in large rosettes, pinkish white flowers, 4, 1/4. **Saponaria**, dwarf trailing, pink flowers, 6, 1/6. **Saxifraga**, mossy, crimson or pink flowers, 3, 1/6; white, 4, 1/4. **Sweet Scabious**, lovely colours, dwarf or tall, 6, 1/4. **Scabiosa** caucasica, large, exquisite mauve flowers, one year old, 3, 1/6; two year,

very large, 1/- each. **Shasta Daisy**, 4, 1/4. **Sedums**, 4, 1/4. **Silene**, pink, compact, 12, 1/6. **Solidago** Golden Wings, 3, 1/6. **Solomon's Seal**, 6, 1/6. **Stachys** (Lamb's Wool), 6, 1/6. **Sweet Rocket**, purple or white, 6, 1/4. **Sweet William**, new Scarlet, Pink and Crimson Beauty, 6, 1/6; double white, 6, 1/6; double and single hybrids, 12, 1/6. **Thistle** Queen of Scots, 3, 1/6. **Thalictrum**, hardy Maiden-hair, 3, 1/6. **Thrift**, compact, pink flowering, 6, 1/4. **Tritoma** (Red-hot Poker), 3, 1/6. **Tusailago** (Winter Heliotrope), 3, 1/6. **Tunica** Saxifraga, dwarf, edging or rockery, 6, 1/6. **Verbascum**, large, tall, yellow, 3, 1/6. **Valerian**, old crimson favourite, 6, 1/6. **Veronica** spicata, tall blue, 4, 1/4; gentianoides, dwarf blue, 4, 1/4. **Viola** cornuta, masses of small blooms, lovely for rockeries, etc., Mauve and Purple Queen, White and Blue Perfection, 12, 1/9. **Violas** from seed, Bath's bedding, yellow, white, purple, blue, and mixed (all colours), 12, 1/6; good bedding, mauve, from seed, 12, 1/10; from cuttings, best large mauve, yellow and white, 12, 6d.

STRONG TRANSPLANTED GREENHOUSE AND POT PLANTS, ETC. **Agapanthus**, blue African Lily, two year old, 2, 1/4. **Agatha** celestis, lovely blue Marguerite, 6, 1/6. **Aralia** (Fig Palm), 3, 1/6. **Arum** Lily, one year, for potting, 3, 1/6. **Asparagus** Fern, erect or trailing, 3, 1/6. **Begonias**, evergreen, perpetual flowering, pots or bedding, 4, 1/4. **Beauty Stocks**, lovely, fragrant, double, 6, 1/6. **Cannas**, Crozy's beautiful hybrids, strong two year old, 3, 1/6. **Celaia** cretica, charming perennial pot plant, spikes yellow and mauve, 4, 1/4. **Cobaea** scandens, handsome, rapid climber, large purple flowers, 3, 1/6. **Cyclamen**, choice strain, 3, 1/6.

Dahlias, Paony-flowered, Collarette, Colossal, single, Cactus, double, etc., 3, 1/6. **Deutzia** gracilis, pot shrub, soon be covered with lovely pink or white flowers, 2 for 2/-.

Echeveria, glaucous rosettes trailing red flowers, 4, 1/4. **Eucalyptus** (Blue Gum), 4, 1/4.

Fuchsias, choice sorts, 4, 1/8. **Francoa** (Bridal Wreath), long trails white bloom, 4, 1/4.

Gloxinias, large erect blooming, lovely colours, 2, 1/4.

Heliotrope (Cherry Pie), 3, 1/6.

Ivy Geraniums, double pink, 3, 1/6.

Lily of the Valley, strong flowering crowns, 6, 1/6. **Lobelia** cardinalis Queen Victoria, claret foliage, spikes scarlet flowers, 3, 1/6.

Marguerite Covent Garden White, and large yellow and sulphur, 4, 1/4.

Nicotiana, white or crimson, fragrant Tobacco, 4, 1/4.

Passion Flower, 2, 1/6. **Plumbago**, beautiful blue, 1/4 each. **Primula** obconica, new giant, lovely colour, 3, 1/6; malacoides, lilac, 4, 1/4; kewensis, yellow, 4, 1/4; japonica, Queen of Primulas, 3, 1/6; cortusoides, rosy purple, very fine, 3, 1/6.

Rehmannia, handsome large pink trumpet flower, greenhouse perennial, 3, 1/6.

Salvia coccinea, scarlet, 4, 1/4. **Saxifraga** Mother of Thousands, 4, 1/4. **Smilax**, trailing, 4, 1/4. **Streptocarpus**, lovely Cape Primrose, beautiful new hybrids, 3, 1/6. **Schizanthus** Wistonsis hybrids, 4, 1/4.

Tomato, strong transplanted, best varieties, 6, 1/6.

STRONG VEGETABLE AND HERB PLANTS from open ground. **Asparagus**, Kelway's Giant, two year old roots 7/- 100; three years, 10/- 100. **Sage**, **Thyme**, **Mint**, **Marijoram**, 3/- doz. **Paraley**, best curled, 1/4 doz. **Spring Cabbage**, **Brussels Sprouts**, **Coa** and **Cabbage Lettuce**, **Leeks**, **Cauliflower**, **Winter Tripoli Onion**, **Pickling Cabbage**, 1/9 100.

STRONG HARDY CLIMBERS. **Ampelopsis** Veitchii, self-climbing, small leaf, large roots, several trails, each 2s. **Clematis** Traveller's Joy and Flammula (Virginia's Bower), white, rapid climbers, large two year roots, 2/- each. **Honey-suckle**, very fine red-flowering Dutch, large plants, 3/- each. **Wistaria** sinensis, large racemes of bluish-lilac flowers, 3/6 each. Everlasting **Climbing Pea**, red, white, pink, 3, 1/6. **Apios**, tuberous rooted **Wistaria** (not sinensis), rapid climber, sweetly scented purple flowers, 3, 1/6. **Cayotegia**, double pink Morning Glory, 3, 1/6. **Passion Flower**, hardy blue and white, 1, 1/4. **Tropæolum** speciosum, tiny flame flowers, Glory of the Scotch Islands, 2, 1/6. **Jasmine**, fragrant white flowering two year rooted cuttings, 1/- each; very rare yellow summer-flowering, two year rooted cuttings, 1/4 each; yellow winter flowering, two year rooted cuttings, 2, 1/9. **Eccremocarpus**, trusses orange-red flowers, 2, 1/4.

Extract from one of the leading Garden Journals, dated March 17, 1923:—"MRS. PYM'S HARDY PLANTS.—This is a catalogue of Hardy Plants for beds, borders and rockeries, also Hardy Climbers, Vegetable and Greenhouse Plants, all of which are in small lots priced carriage paid and offered on money back terms. There is no plant catalogue more to be recommended to the amateur gardener. It is post free from Mrs. Pym, and readers may order therefrom with every confidence of entire satisfaction."

SPRINGTIME.

There are few Spring-tide flowers which have not found a poet to celebrate their charms, but Spring vegetables still lack a laureate. Here is an opening for our neo-Georgian poets. As a stimulus, we shall be pleased to supply them, or the less poetical, with fine three year old plants of Conover's Colossal Asparagus at 22/6 100, carriage and packing free, and planting should be done at once.

[APRIL 21, 1923.]

WILD SPECIES OF TULIP

IN the eyes of some gardeners there is a fascination about wild species of plants which is never or seldom present in the garden forms which have been derived from them. In Tulips this difference is at least as striking as in any other genus and we have only to compare a collection of the so-called English florist Tulips with another of Tulip species in order to appreciate it. The florists' Tulips are all of one height or very nearly so; they all stand erect; they all have, or should have, petals of the same shape and all the flowers are striped. This is attributed by the florists to the mysterious "breaking" by which the self-coloured seedlings become striped and variegated with pink, red or purple on a white or yellow ground. The fact is that these bulbs are all diseased and suffer from a complaint akin to "mosaic" in Potatoes. So we turn from them to the species and find some with two, three, six or even ten flowers on a stem; others which come up with their stems bent like a shepherd's crook; and others, again, with amazing flowers of the most dazzling scarlet, roins, or 12ins. in diameter. There is infinitely more variety and, moreover, the first species flowers in February and the last not till the end of May or even the first days of June.

The first to open is a dwarf plant with one or two small starry flowers, white with a yellow centre, and coming from the south of Russia near the lower reaches of the Volga. This is *Tulipa biflora*, and it is closely related to, and closely followed in the flowering season by, *T. turkestanica*, which is rather larger and has a stem about 8ins. or roins. in height with any number of flowers up to a dozen. The colour is white, with a much smaller yellow centre than in *T. biflora*. Both these species are usually in flower before the end of February, and the first flowers of *T. Kaufmanniana* may also be expected before the end of the month. This is in some ways the most surprising of all Tulips. Almost as soon as the leaves are through the ground the buds begin to appear, and they are then not green as in other species, but the colour of the perfect flower,

and ready to open on the first sunny day. As the sun grows stronger in March the stems lengthen, until, near the end of the month, they are a foot or more in height, and the bed of Kaufmannianas is a wonderful blaze of colour. The typical flower when open is white with a large yellow centre, though there are others which are yellow all over and others, again, entirely scarlet. Of the yellow and white forms the closed flowers shew that the backs of the outer petals are flamed with scarlet or shaded with pale, slate blue or merely tinged with pink.

Before the last petals of this splendid Tulip fall there should be in flower the first specimens of *T. Greigi*. The two species seem to grow in close proximity in Russian Turkestan, and there are some interesting hybrids between them. The two most noticeable features about *T. Greigi* are the fact that the leaves are striped and blotched with dark brown-purple and the magnificent shape of the flowers. The three outer petals curve outwards, while the others remain more nearly erect and give the flower an outline, which is as distinct as it is pleasing. The colour is usually

a brilliant deep scarlet, though there are bright yellow forms blotched or shaded with red.

Even larger than the flowers of *T. Greigi* are those of *T. Eichleri* from the region to the south of the Caucasus and of *T. Fosteriana* from further east. Of these the petals often measure more than 5ins. in length, so that the effect produced by a number of the open flowers on a bright sunny day in April is better imagined than described. The colour of both is a dazzling scarlet, the shade being brighter and clearer in *T. Fosteriana*, which also is distinguished by its shorter and broader leaves and by the fact that its basal blotch of yellow or black and yellow is more nearly circular in outline than in *T. Eichleri*, where the blotches on the three inner segments are much larger than those on the outer segments.

A little later come two other Turkestan species, first *ingens*, with narrow, glaucous leaves and big scarlet flowers and a large black base, and then *Tubergeniana* with greener leaves and even larger flowers of a better shape and of a lighter scarlet.

Few Tulips are so distinct as *prastans*, which flowers at the end of March and early in April. The leaves are so glaucous as to be rough to the touch on the upper surface and they also have a midrib, which distinguishes them from those of any other species. The stems branch and bear two or three flowers of a curious shade of light scarlet. Of this species there are two distinct forms, the tall type usually with a little black shading

THE TYPICAL WHITE, YELLOW-CENTRED TULIPA KAUFMANNIANA,
THE BACKS OF THE PETALS SHADED PINK.

at the base when the flowers open, and the dwarf early form with bright red filaments to the anthers. This is known as the variety *Tubergeniana*.

The latest of all species to flower is *T. Sprenger* from Armenia. This has narrow leaves of a deep green and a bright red flower, and the additional merit of seeding very freely, probably because it comes so late that the flowers escape the effects of late frosts. The seeds may be scattered about the garden among lilies and other perennials, and some four or five years later these parts of the garden will one day be suddenly gay in most surprising fashion.

For the rock garden nothing can surpass the brilliant little trio, *Maximowiczii*, *limicola* and *Batalin*. The first two have brilliant scarlet flowers which open flat in sun and only differ because the first has upright leaves while those of the other sprawl on the ground. *Batalin* is probably merely a colour form with pale yellow flowers, and the most delightful hybrids of all shades of buff and apricot can be obtained by crossing.

T. Clusiana with cherry red backs to its outer petals and white inner surface with a deep purple base has long been well known and has become naturalised in Southern Europe. Probably it is native of Central Asia, or possibly of the North-west Frontier of India, where there also grow forms known as *stellata*, some white with a yellow, instead of a purple, base and others in which the white ground is replaced by deep yellow.

In Greece and in Western Asia Minor there are a number of Tulips closely allied to the sweet-scented yellow *T. sylvestris*, which is claimed, though perhaps the claim is doubtful, as a native of this country. The flowers usually have pointed petals and are poised horizontally rather than vertically. One called *Orphanidesii* has flowers of a shade of terra-cotta with an olive green base, while others are almost orange. *T. Hageri*, from the borders of Attica, has flowers of a curious combination of scarlet and green, while *T. pruinella*, an African relative of this group, has white flowers flushed outside with pale green and pink and the extraordinary habit of remaining closed through the heat of the day when all the others open widest and of only opening in the late afternoon when the rest close their petals.

Another ally of the same group, *T. dasystemon*, comes from Turkestan and is a dwarf plant well suited to a rock garden. Each bulb may send up as many as five or six white star-shaped flowers with a yellow centre, charmingly set in a tuft of narrow deep green leaves.

Many of the species are, unfortunately, rare in cultivation, but the gardener who makes efforts to obtain them will be well repaid. *T. triphylla* is a dwarf species with deep orange flowers; *T. Kolpakowskiana* is a graceful plant with narrow leaves and yellow flowers backed with scarlet; while *T. Ostrowskiana* has the curious habit of pointing its buds to the ground until the stem is full grown. Even more striking is *T. Schmidtii* from the district south of the Caucasus. It flowers very late and sends up a tall stem with a large scarlet flower from a rosette-like tuft of ten or twelve leaves.

The secret of successful cultivation of Tulip species is simple, for it consists in lifting the bulbs every year as soon as the foliage has died down or even turned yellow. They should then be allowed to dry in an airy place, so that the old skins can be cleaned off. The bulbs should be stored in a warm place, either in paper bags or in dry sand, until November and then replanted at least pins, and preferably ones, or suns, deep in well worked soil. If this is sandy and rich in humus, so much the better, and the addition of

TULIPA DASYSTEMON, WHITE, CENTRED YELLOW.

PALE MAUVE AND YELLOW, TULIPA SAXATILIS.

THE SCARLET AND YELLOW FORM OF *T. KAUFMANNIANA*.

bone-meal, when the beds are dug over before planting, will be beneficial.

There is one difficulty about lifting the bulbs and that is that they are not always to be found where they were planted. Some run horizontally and send out stolons at the end of which new bulbs form often 6 ins. or 1 ft. from where the old bulbs were planted. The worst offenders are the Cretan *T. saxatilis*, with its beautiful flowers of pale mauve and yellow, and the so-called *T. præcox*, which is almost certainly a garden hybrid of some Syrian species. Others send down "droppers" to a depth of several inches, and it is fortunate that it is usually only small bulbs and not those

of flowering size which transgress in this way. Those gardeners, however, who are unaware of this trick will be confident that they have lifted all their bulbs of *T. Kaufmanniana* or of *T. Greigi* and then be surprised to find them still in the same position the next year.

It is not safe to leave bulbs in the ground from year to year, except possibly in fertile soil on the sunny side of, and among the roots of, shrubs, where the soil will be sucked dry in summer and so allow the bulbs to obtain that ripening without which they will begin to grow too early in the year and then fall victims to late frosts and bad weather.

W. R. DYKES.

CLIMBING AND WALL PLANTS

MANY of our vigorous climbing plants never look so charming as when they have plenty of room for development, rambling freely over large bushes or small trees, or old fences or walls, or, failing these, over a great pyramid of rough oak branches. Under such conditions there is no need for the severe annual pruning which is necessary when free-growing climbers are set amid cramped surroundings. The luxuriant tangle of growth made by the Traveller's Joy (*Clematis Vitalba*) over hedges and bushes in many parts of the country gives us a good example of what may also be done with many of the best exotics.

But satisfactory results can only be obtained by treating the plants well. It is of little use planting climbers near the trunk of a tree beneath shade of branches, where, in the summer-time, they will get very little water. They are better placed about the outskirts of the branches and encouraged to ascend from the outside of the tree. Each plant must be provided with a really good pocket of rich soil, which should be defended against any encroaching roots until the climber is well established. This is sometimes done by sinking a tub or box in the ground to hold the good soil, or a trench may be dug 2 ft. or 3 ft. inside the pocket of the new soil and all the tree roots cut away. The climbers may also be assisted by a generous mulch of well rotted manure or an application of liquid manure now and then; but once they become really vigorous and take full possession of the support they are usually well able to take care of themselves.

Many of the ornamental Vines are excellent for this free and easy method of growth, particularly such rampant growers as *V. Coignetiae*, *V. Labrusca*, *V. Thunbergii*, *V. armata*, *V. riparia*, etc., while *V. inconstans* (*Ampelopsis Veitchii*) and *V. muralis* are useful for planting near an old Pine, up the naked trunk of which they will ascend to a height of 40 ft. or 50 ft., clothing it with a mantle of green, changing in autumn to glowing crimson. A useful climber of vigorous growth is found in *Celastrus articulatus*. This will reach the top of a moderate-sized tree, and though its flowers are small and insignificant, its fruits are very showy during late autumn and early winter, and remain quite attractive until Christmas. When an old Holly or Conifer can be given over to *Polygonum baldschuanicum* the effect is quite good, the dark green foliage of the support forming an excellent setting for the white flowers and fruits of the climber. Another excellent plant for a similar position is *Rosa moschata*, which attains a height of at least 24 ft. and blossoms very freely. The large, rounded leaves of the Dutchman's Pipe (*Aristolochia Sipho*), coupled with its vigorous growth, warrant it a place among naturally grown climbers, although its curiously shaped flowers are not very

showy. *Periploca græca* is another vigorous climber which is suitable for planting in the open in the milder parts of the country, although in some places it must have a wall. Then there is *Actinidia arguta* and the new *A. chinensis*, both good for the purpose, as are also *Wistaria chinensis* and *W. multijuga*. Numerous Clematises can be used for the same purpose, particularly such kinds as *C. montana* and its variety *rubens*, *C. campaniflora*, *C. orientalis*, *C. Flammula*, *C. Jouiniana*, and the numerous forms of *C. Jackmanni* and *C. lanuginosa*. Under certain conditions *Jasminum officinale* may be used with effect, while the winter-flowering *J. nudiflorum* looks well in companionship with Ivy for covering low walls or fences. The Ivy in its various forms may be allowed to grow over old deciduous trees, for it causes them little harm, and is very picturesque when it reaches its mature or flowering stage, and covers the head of its support with a luxuriant evergreen growth. In the south-west counties *Solanum jasminoides* may be used with effect to cover low fences or evergreen bushes, for its white flowers are attractive over a long period in summer.

All the climbers already mentioned can, of course, be grown against walls as well as in other positions, although it is often advisable to reserve all available wall space for tender climbers, and for plants of shrubby habit which are unsuitable for open borders. Locality decides largely the question of the amount of protection necessary, for a plant which is tender about London may be quite hardy in Cornwall, while a wall plant in Cornwall may require indoor culture about London.

Among self-clinging climbers the various Ivies are the most important, for they are evergreen and very hardy, and the commoner kinds often flourish in the heart of a smoky town, and cover

bare and ugly walls with greenery. A severe clipping once or twice a year is all the attention they require. When one clipping only is given, the work should be done in April, but when more attention can be allowed the removal of long shoots in July is an advantage. Other self-clinging climbers are *Vitis inconstans*, *V. muralis*, *V. Henryana*, *Hydrangea petiolaris*, *Ereilla volubilis* and *Tecoma radicans*. The last two are only partly self-clinging, and all require to be nailed to their supports until they are growing freely in the desired direction.

Rough-cast walls sometimes present difficulties to the horticulturist, for until the newness of lime or cement has worn off, the climbers do not cling well. It is therefore advisable to fix trellis work or battens on the walls to hold the plants in their places. As a rule, however, such walls do not give much trouble after the freshness of the lime or cement has worn off. In the case of creosoted fences it is wise to secure the plants to strands of wire gins, apart running along the fence.

THE BEAUTIFUL JASMINUM PRIMULINUM.

Climbers which do not naturally cling are best suited for growing in this way.

The drooping growth of *Garrya elliptica* would be ruined by hard pruning, and it may be allowed to grow according to its nature if it is placed against a blank wall or fence. When shrubs are grown on the walls of houses they must generally be cut quite close, otherwise they obstruct light, collect dust and dirt, and have a neglected appearance. Moreover, unpruned plants on house walls may soon cause a good deal of mischief to gutters, water pipes, walls and roofs, and it is advisable to keep them cut back each year at least 1 ft.

how the cutters, and to remove any shoots which appear to be forcing their way between the joints of pipes or into crevices in woodwork. On no account should climbers be allowed to encroach upon the roots of buildings, for in such a position they are bound to cause serious harm sooner or later.

Deciduous wall plants that are grown solely for ornamental foliage or for their fruit in autumn should be pruned after the fall of leaves or fruit, and not later than February. *Ceanothus* Gloire de Versailles and other shrubs which bloom from young wood may also be pruned during the winter, as also may the long shoots of *Wistaria*, for its flowers are borne from stunted, spur-like growths and from the lower buds of shoots pruned back during the previous summer. Speaking generally, however, plants grown for their beautiful flowers, such as *Cydonia japonica*, *Chimonanthus fragrans*, *Jasminum nudiflorum*, *Forsythia suspensa* and the spring-flowering *Ceanothuses* must be pruned as soon as the flowers fade. As a rule it is well to prune wall plants on the spur system, getting the branches well back to the wall each year and depending upon new wood to produce the flowers. Plants which bear their flowers on the growth of the previous year should only be pruned once. The double-flowered *Prunus triloba*, for instance, flowers entirely on the new shoots formed after the yearly pruning in May, and if these new shoots are cut away the next year's blossoms will be lost. When plants can be allowed to grow out from the wall they may be left unpruned for several years or just be cut back sufficiently to enable the old branches to support the weight of the new growth.

Soil at planting time should be of good quality, for all plants should be encouraged to develop as rapidly as possible, though ultimately some may flower more profusely in moderately poor soil. When too rapid growth is being made a little root pruning will usually give the desired check. On the other hand, stronger growth can be encouraged by surface dressings of manure or by other stimulants.

Among the most suitable wall plants for the colder parts of the country are the climbing Roses and Honeysuckles, particularly forms of *Lonicera Periclymenum* and *L. japonica*, *Garrya elliptica*, *Cydonia japonica*, *Forsythia suspensa*, *Escallonia laurifolia*, *Magnolia conspicua*, *M. stellata*, *M. salicifolia*, *Sophora viciifolia* and, in fact, any good flowering shrubs which grow but do not flower well in the open in that particular district. Many of those mentioned below may also be tried, for climatic conditions often vary greatly in the course of a few miles, and what may require protection on one side of a county may be quite hardy on the other.

In the South and Southern Midlands the following can be added: *Jasminum nudiflorum*, *J. officinale*, *J. revolutum*, *Clematis* in variety, particularly the many garden varieties and *C. montana* and its variety *rubens*, the various hybrids of *Camellia japonica*, *Magnolia*

grandiflora, all the *Wistarias*, *Ceanothus rigidus*, *C. papillosus*, *C. divaricatus*, *C. Veitchianus*, *C. Gloire de Versailles*, *Abelia uniflora*, *A. grandiflora*, *A. triloba*, Scented Verbena (*Aloysia citriodora*), *Escallonia macrantha*, *Hydrangea petiolaris*, *Prunus triloba* fl. pl., *Myrtus communis* and varieties, *Pittosporum crassifolium*, *Olearia macroloba*, *Pasiflora coerulea*, *Rosa bracteata*, *Chimonanthus fragrans* and its variety *grandiflora*, *Pyracantha coccinea*, *P. angustifolia*, ornamental Vines and Ivies in variety.

For Cornwall, Devonshire, South Wales, Ireland and some parts of West Scotland the following

CLEMATIS NELLIE MOSER, A GOOD GARDEN VARIETY.

more tender plants are likely to prove satisfactory against walls: *Clianthus puniceus*, *Cassia corymbosa*, *Lupageria rosea* and its variety *albiflora*, *Clematis indivisa*, *Correas* in variety, *Solanum crispum*, *S. jasminoides*, *Punica Granatum* and its variety *nana*, *Acacias* in variety, various kinds of *Metrosideros*, *Abelia floribunda*, *Magnolia tuscata*, *Cestrum elegans*, *Araucaria sericea*, *Erubotrya japonica*, *Sophora tetraptera*, *Diospyros Kaki*, *Cydonia sinensis*, *Billardiera longiflora*, *B. scandens*, *Sollya heterophylla* and, in specially favoured places, *Rhodochiton volubile* and *Citrus medica*.

W. D.

A FINE OXALIS

IT is a great pity that more of the *Oxalis* family are not hardy in English gardens. There are over two hundred species, mostly natives of South Africa and South America, and those that I used to see growing in the veldt at the Cape were exquisitely beautiful—pink, crimson, apricot, yellow and white. Yet I only know about ten or a dozen hardy species, and of these, several, though beautiful, are capable of becoming in the rock garden what rabbits are in Australia. I was all the more delighted, therefore, at being introduced a year or two ago by Mr. Ingwersen to *Oxalis magellanica*, for *Oxalis magellanica* is a hardy species, well behaved and of the greatest charm. *Oxalis enneaphylla*, *enneaphylla rosea* and *adenophylla* are sumptuous aristocrats, so slow of increase as almost to be accused of race suicide, while pretty little *Oxalis corniculata* and its red-leaved variety *rubra* go to the other extreme and indulge in a perfect orgy of fecundity.

Oxalis magellanica is a dwarf carpeter, in general aspect much like our own native Wood Sorrel, *O. Acetosella*, on a minute yet effective scale. It creeps closely and steadily, never rising more than half an inch from the ground. Its clover-shaped leaves have just the same silkiness as Wood Sorrel. The flowers, however, are different. Those of the Wood Sorrel are delicately satiny, with pale water-mark veinings, and a droop as of conscious meekness. The flowers of *O. magellanica* are round and saucer-like, large for the size of the plant and of a clear dead whiteness which there is no mistaking, and there is no modest droop about them either; they stare straight up at you with an assurance which their beauty justifies.

But where has this eligible plant been rusticated all these years? I do not pretend to know half the plants moving in good rock garden society, yet I confess I am surprised I had not met *O. magellanica* until a couple of years ago, nor even heard of it. Nicholson does not mention it, and I had not noticed it in any of the Alpine Who's Who, such as Tucker, Prichard or Stormonth. Who brought it from Magellan's Straits, and when? I wish someone would write to THE GARDEN giving information. Oh! I have just looked into Farrer's "English Rock Garden." He at least makes brief passing mention of the plant. And I read on to see what he has to say about *Oxalis enneaphylla* and my own particular introduction, *enneaphylla rosea*. He gives *enneaphylla* some of the praise its great beauty deserves, and dismisses *enneaphylla rosea* in a few words, almost as an undesirable, and hastens on to *adenophylla*, and praises it greatly at the expense of *enneaphylla rosea*. Now, *enneaphylla rosea* is not a fixed type, and possibly Farrer never saw the best forms. In its finest developments the colour is clear and decided, the flowers full and large and round, and always the texture of the petals is solid and waxy. Of *adenophylla* I have seen two distinct forms. One with a darker blotch at the base of each petal, and one in which the petals are pale pink throughout; but in neither form are the petals so full and round and overlapping as in the better forms of *enneaphylla rosea*, and the texture of the petals is thin and flimsy after the solid waxiness of *enneaphylla*. Nor has *adenophylla* the delicious almond fragrance of *enneaphylla*. This is not to say that *adenophylla* is not an extremely pretty plant. It is merely to say that Farrer liked *adenophylla* best and that I much prefer *enneaphylla rosea*. One of these days I hope to take my special form of *enneaphylla rosea* to Chelsea or Vincent Square.

Stevenage.

CLARENCE ELLIOTT.

MORE ABOUT SPRING-FLOWERING BULBOUS PLANTS

TULIPS. In THE GARDEN for April 7, Tulipa Gesneriana is spoken of as being a wild species on a par as it were with *T. dasystemon*. *T. Gesneriana* is, as far as I have been able to find out, a sort of Barnacle Goose Tulip, at least I have never been able to run it to earth any more than Sylvius—afterwards Pope of Rome—was able to locate the strange tree that bore geese when he, thirsting for knowledge, visited the northern part of Scotland in 1468. Probably, however, *T. Gesneriana spatulata*, or major, is meant. If so, I have always understood that the almost certain probability is that it is a garden hybrid raised in the early part of the nineteenth century by Van der Vinne. Again, I would very much like to know what evidence there is for regarding either *T. Gesneriana* or *T. Gesneriana major* as "the parent of the May-flowering Darwin Tulips."

I would like to add *Tulipa præcox* to the select list of good doers. I saw it this last March for the second time in Mr. Peter Veitch's Exeter nursery, where it flourishes exceedingly and seeds "all about the place." This is somewhat similar to *T. Oculis-solis*, but is distinguished from that species by its long almond-shaped dark basal blotches bordered with primrose yellow, by its earlier blooming, and by the yellowy exterior of the perianth segments. The last named is called *Gesneriana* in the *Botanical Register* (Plate 380), but this certainly is no longer considered to be correct, if it ever was.

ERYTHRONIUMS OR DOG'S TOOTH VIOLETS.—One of the best in my garden is *E. grandiflorum* (or *gigantum*?). In the place of the solitary flower of *americanum* it has generally two and frequently three flowers on a stem. They are large and of a rich yellow colour. It appears to seed itself fairly freely. *Hartwegii* is another excellent and enduring variety. Its beautiful marbled leaves are just as pleasing as its pale straw and orange-based flowers.

CROCUS SPECIES.—Just a word for the little deep yellow *Susianus*. I do not like it to be left out when the early-flowering species are written about. And what about that exquisite little hybrid *E. A. Bowles*, which was born a few years ago in the Haarleim nursery of van Tubergen? It is not a true species, but we may look upon it as next door to one. It is a beautiful deep primrose yellow, and although rather expensive, may be bought with confidence, as it is a good doer and it increases freely.

IRIS RETICULATA CANTAB.—I fancy *reticulata* seedlings must be favourites with the gods, as so many, I am told, die young. *Cantab.*, however, is one of those that thrive and increase, and because of this and because of its lovely shade of pale blue is loved by every gardener who has seen it. At least anyone who does not do so must be more or less of a crank. I hope it will not be long before it may be found in some of our dealers' lists.

IXIOLIRIONS.—"When doctors differ." When dictionaries of flowers differ and when one has no learned botanist at hand to solve the perplexing

A GOOD POT OF THE GOLDEN LACHENALIA NELSONI.

nomenclature of the afore-mentioned works, one can only give the names as sold by the dealer. Hence I write of *Ixiolirion Ledebouri* and *I. Pallasii*. Under the sennames I have this year renewed my acquaintance with this peculiarly graceful little genus. It looks, if the authorities that I have consulted are to be trusted, as if it only contained two species, and that *montanum*, *Pallasii*, *Ledebouri*, *brachyantherum* and *tataricum* are but variants of one and the self-same thing with only insignificant garden differences to divide them. *I. Kolpakowskianum* I have never seen, so it may be more unlike the others than I expect it is. It, however, reminds me what an escape the genus has had from being called *Kolpakowskia*! These tongue-twisting names might have no terrors if you happen to

"have been a Russian,
A French or Turk or Proesian,
Or perhaps Italian,"

but although it does not seem altogether happy, *Ixiolirion* or *Ixia*-like Lily is a distinct improvement for the "Englishman." To me the palish purple-blue flowers suggest loosely built, narrow petalled Campanulas poised on thin, slender, quivering pedicels which spring from a stronger main stem in more or less umbel fashion. There is no doubt that the species or variety with the many aliases is one of the most graceful flowers that can be found to fill medium-sized vases. I gathered some yesterday and they are now in water springing out of a greeny haze of short growths of *shaved* *Asparagus Sprengeri*. The pots are labelled *Ledebouri* from which the bunch was cut. *Pallasii* is still very much in the bud stage, so I presume one is earlier than the other, which is something to note, for most people when they

THE DEEP PRIMROSE YELLOW CROCUS E. A. BOWLES.

get to know these delicate and graceful flowers will be glad to have their season lengthened.

Ixiomons are on the borderland of hardiness. They have come through this last winter all right here, as they have done several times in the past, but for all this I fear in cold seasons they would be killed in most Midland and Northern gardens. As prices are to-day they are a

cheap bulb, and might well be given a trial outside where the soil is on the light side and where a warm position can be spared. In Southern gardens they are probably hardy. From what has just been written it will be gathered that when they are grown under glass they only require a minimum of heat and plenty of air.

JOSIEH JACOB.

A SPLENDID "FORTNIGHTLY" SHOW

IN anticipation of the Daffodil Show on the 12th and 13th inst., these beautiful flowers formed a considerable part of a very attractive Show at the Royal Horticultural Society's Hall on April 10 and 11. The recent bitterly cold weather does not seem to have had the slightest adverse effect on Narcissi, for they were shewn in very large quantities and of such superlative quality that two gold medals were recommended for collections. These were arranged by the Donard Nursery Company and by Messrs. Barr and Sons. They were at opposite sides of the hall, and each drew the close attention and admiration of a great many enthusiasts and also of general visitors.

Both collections included a large proportion of splendid seedlings. In the Irish collection these were principally of the large Trumpet section, while most of Messrs. Barr's were Leedsii and Barrii types. Of the named sorts in the Donard collection Magog, Matron, Vestal Virgin and

Antrim of the Trumpets; Loch Fyne, (Incomparabilis); Donax, Torch and Dragon with vivid coronas and Thetis and Nightingale, (Poeticus), demanded special mention, though every one of the many blooms was really excellent.

It was the chaste and fascinating Leedsii types that at first drew the enthusiast to the collection of Messrs. Barr and Sons, and the very best of the named sorts were Lavender, Grey Lady, Agnes Harvey, St. Senara and Sea Nymph. As is only fitting, the collection was also very strong in the Barrii section, and of these the vivid coronas of Fiery Monarch, Nannie Nunn, Picador and Rahant were most charming. There were also some splendid seedlings of this type.

The fascinating blooms staged by Messrs. J. R. Pearson and Sons were all from home-grown bulbs, and very good they were too. Such Barrii sorts as Marshlight, Lucifer, Sunrise and Sunset Glow had particularly bright coronas. There were also many desirable Trumpet varieties,

and Hæro, Barcarolle and Virgil of great merit among the Poet's Narcissi. Messrs. Cartwright and Goodwin also had in Jasper, Cigar, Sunrise and Dragon particularly good Barrii varieties; while the Incomparabilis Bernardino, Loch Fyne and Lady Mary Bosawen were very attractive.

The new Scarlet Perfection had a prominent place in the collection of Messrs. R. H. Bath, Limited, and there were other good Barrii seedlings there. Dopsis and Firetail, Barrii types; Sarabanda and Noel, Poeticus varieties, were also excellent. Double Daffodils were the most important in Mr. W. F. M. Copeland's exhibit, and these included Mary Copeland, Strawberries and Cream, Orange and Ripe Tomatoes.

The large display of Messrs. Sutton and Sons was quite distinct from the above collections, which contained a great many varieties in quite small numbers. Messrs. Sutton and Sons aimed at illustrating the great decorative value of some of the more abundant varieties when used in generous quantities. This exhibit was arranged with all the skill and taste the public has long since come to expect from the Reading house, and it was one of the chief features of the Show. The principal Daffodils so well used were King Alfred, Princess Juliana, Mme. de Graaf, Mustapha and Spring Glory of the large Trumpets; Firebrand, Salmonetta, Peach, Sunrise and Red Chief of the red-cupped Barrii sorts; and Great Warley and Lord Kitchener of the Incomparabilis varieties.

Among the general floral exhibits the chief were Rhododendrons, Roses, Carnations and

THE LOVELY ROSE AND CREAM RHODODENDRON EXMINSTER.

THE DELICATE SULPHUR TRUMPET DAFFODIL PURITAN MAIDEN.

Polyanthuses. Although the largest Rhododendron collection was by Messrs. Gill and Son, there were two meritorious displays by amateurs. Mrs. Heywood Johnstone, Bignor Park, Pulborough, sent quite a large number of magnificent trusses of Rhododendron Falconeri, with many other sorts, which included the deep pink Lueombeana and Dr. Stocker, a delightful white flower which is lightly spotted on the two upper petals. Lieutenant-Colonel Messel sent from Nymans, Handcross, a very pretty collection of unnamed hardy varieties.

The fragrant greenhouse Rhododendrons were well represented. Mr. L. R. Russell had five or six sorts, which included Princess Alice and Gibsoniana superba. Messrs. Gill included Countess of Haddington apparently cut from the open. Beautiful as their Rhododendrons were, however, most visitors paid greater attention to the splendid spikes and large glossy leaves of the Norfolk Island Forget-me-not (*Myosotidium nobile*). These beautiful blue flowers were also on view in Mr. G. Reuthe's exhibit.

A few unusually large flowers of the Japanese Tree Pæony (*Pæonia Moutan*) were to be seen in Messrs. Piper's collection of general plants. Other shrubs of note included Veronica Hulkeana, Daphne Cneorum, Brooms in great variety, Pyruses, Wistarias and double flowered Cherries.

Among the alpine, several patches of wonderfully blue Gentians compelled admiration. The patches of *Gentiana verna* in Messrs. C. Elliott's little collection were of magnificent colour and splendidly flowered; while Messrs. R. Tucker and Sons had most charming clumps of *G. Clusii*, and they also shewed the rare yellow Himalayan Poppy (*Meconopsis integrifolia*), *Edraianthus serpyllifolius*, *Dryas Sundermanni*, *Omphalodes capadocica*.

Drabas and Houstonias were to be seen in quantity in various exhibits of alpine. Mr. G. G. Whitelegg included a patch of the graceful *Lycnis alpina* and also had many little conifers suitable for the rock garden.

Mr. J. Douglas brought a good collection of the Auriculas he grows so well. The Alpine and the Fancy varieties were about equally represented, and there were many excellent varieties of each.

Carnations continue to be consistently well shewn by Messrs. Allwood Brothers, Mr. C. Engelmann, and Messrs. Stuart Low and Co. The last named also staged good *Hippeastrums*, *Cyclamens* and *Mimosas*.

In different parts of the hall there were many beautiful and fragrant Roses. Mr. George Prince had a vase of magnificent blooms of the creamy white Muriel Wilson, which were most deliciously fragrant. The gorgeous *Padrè*, *Mme. Butterfly* and the deep yellow Lady Hillingdon were also splendid on this stand. Deeper coloured blooms of Climbing Lady Hillingdon were massed to great effect by Mr. Elisha J. Hicks, and among his many sorts there was a delightful vase of Coral Cluster. *Esme* and *Sovereign* were particularly well coloured in the display by Messrs. B. R. Cant and Sons, who staged the Rev. F. Page-Roberts and *Phœbe* in splendid form.

NEW AND RARE PLANTS.

Narcissus Puritan Maiden.—A chaste and beautiful white Trumpet Daffodil of medium size and good substance. The trumpet is long, widely open and nicely reflexed. Award of merit to Messrs. J. R. Pearson and Sons.

A FINE TRUSS OF RHODODENDRON FALCONERI.

Narcissus "White Seedling."—This unnamed flower is a very large white Trumpet Daffodil which seemed to be a trifle coarse and was somewhat weather stained. It is, however, one of the largest of its type, and will probably be valued as a show flower. Award of merit to Captain Buxton, Titchfield, Hants.

Narcissus Scarlet Perfection.—In this case the superlative name is well deserved, for it is a really splendid example of the broad-cupped *Barrii* *Narcissi*. Although shewn among very many excellent varieties, it stood out in a class by itself by reason of the intense deep fiery orange colouring of its corona and the general high quality of the flower. Unfortunately, only one bloom was staged, so only a Preliminary Commendation was awarded to Messrs. R. H. Bath, Limited.

Rhododendron Exminster.—This is a very beautiful medium-sized Rhododendron which will probably be suited for growing out of doors in the milder parts of the country, and is also well worthy of a place in the cool greenhouse. The loose trusses are made up of widely expanded, bell-shaped flowers, which are delightfully flushed with deep rose on the outsides. The interiors of the flowers are bluish coloured. The oval-shaped, shining deep green leaves are nearly 3 ins. long and about 2 ins. across. It is stated to be a cross between *R. Thomsoni* and *R. campylocarpum*. Award of merit to Messrs. R. Veitch and Sons.

Cattleya Dr. M. Lacroze var. Excelsior.—This is a magnificent stove Orchid of quite uncommon colouring and as large as the average

Brasso-Cattleya. It is also reminiscent of the *Brasso-Cattleyas* in its wide and crested lip, which is of deep bluish purple with broad transverse golden yellow marking. The large, spreading petals are of delicate bluish colour. First-class certificate to Messrs. Flory and Black.

Lælio-Cattleya Faust, Broadlands variety.—Although this name appeared on the official list of awards, a close search failed to discover the plant. Award of merit to Mr. C. R. Ashton.

Lælio-Cattleya Hassallii alba var. Perfection.—A beautiful Orchid of large size. The pure whiteness of the sepals and petals is relieved by the rosy purple lip, which is faintly margined by a nearly white edge. First-class certificate to Messrs. Cowan and Co.

Miltoniodes Harwoodii, Ashted Park var.—One of the most gorgeous Orchids on view for a long time past. The plant bore a large, graceful spike of glowing, velvety deep rose-coloured flowers which have a paler—almost rosy orange coloured—lip and small golden crest. First-class certificate to Mr. Pantia Ralli.

Odontoglossum Aiglon Majesticum.—An erect spike of large, white flowers which are freely marked with chocolate and have a bright golden crest. Award of merit to Mr. H. T. Pitt.

Odontoglossum Aureola.—A robust, erect spike, well furnished with large, shapely flowers of deep yellow colour which pales towards the middle of the segments. The lip has distinct, chocolate markings. This is of an exceedingly unusual type. Award of merit to Mr. Pantia Ralli. *A full report of the R.H.S. Daffodil Show is held over until our next issue.*

FORTHCOMING EVENTS.

April 24.—Royal Horticultural Society's Fortnightly Meeting (two days).

April 26.—Royal Botanic Society's Meeting. Mitcham, Tooting and District Horticultural Society's Meeting.

DRY WALLS AND HA-HAS

THE importance of walling in many garden schemes can scarcely be exaggerated. The terraced garden with its supporting walls and parapets has, if properly proportioned, an interest all its own, but even a dead-level site often offers suitable opportunities for the use of walling.

FIG. 1.—Section of partition wall.

Dry walls may be used instead of hedges to part garden from garden, and the formal sunk garden is a favourite for gardens large or small. Unless on the grand scale, a sunk garden should not be more than 2ft. or, at most 3ft., below the general level. A walk all round on the higher level is very desirable, since the superior view which is obtainable of the beds and their arrangement is one of the principal merits of the sunk garden. An article or two could well be written upon the placing and proportioning of walls and the closely connected problem of the arrangement of garden stairways and terraces, but on this occasion we must confine our attention to the practical problem of the construction of dry—that is unmortared—garden walls.

Let us first consider the dry-built purely partition wall. In this case the ground on either side will be on one level. Fig. 1 shows a section of such a wall which, it will be noted, is built on a concrete foundation. Such a foundation is only necessary if the ground is recently made up or otherwise unsound, or if the wall is of some considerable height. It is very seldom necessary to lay a foundation for the ordinary 3ft. high wall, and a concrete foundation should never be used for a partition wall which is to bear plants, *unless* it is buried at least a foot (preferably 2ft.) below ground level. All walling looks better coursed, and, if it is to be stable, dry walling must be coursed. Such coursing may be straightforward as shewn in elevation in Fig. 2, or random as shewn in Fig. 3, but in either case the principle of construction is the same. Stones of approximately the same thickness are selected for each course. Two thin stones, however, may be used to make

up a wide course on occasion, as shewn occasionally in Fig. 2, or one large stone may be employed to tie two courses into one, as in Fig. 3. Stones should *always* be laid upon their natural bed.

In random coursed walling no stone should be more than two courses deep, and the courses need not necessarily be continuous; the opportunity of a two-course stone may be taken to alter the arrangement of the courses—note the courses between the letters A and B in Fig. 3. Random coursed walling, however, is only suitable for walls of some size—say, 6ft. high as a minimum. It may be used for partition or for retaining walls, and is equally effective for either.

To return to our partition wall, Fig. 1, it is better to have the courses on each side of equal thickness, and to lay one course complete on both sides before commencing the next. The stones of each course must pitch backwards a little into the work, so that the face of the wall may slope back from 5° to 10° from the vertical. A “batter” of 10° sets back the top of a 6ft. wall about 1ft. (shorter or greater lengths in proportion), and a 5° batter sets back about 1ft. in 11ft. These facts are mentioned because measurements are usually easier for the amateur to work out than angles. The batter is very necessary, since gravity and friction have to be depended upon to hold a dry-built wall together. At X, Y and Z headers are shewn tying the two sides together. It is not at all necessary to put in a complete course of headers; indeed, one header in each header course every 2yds. should be ample. It is equally unnecessary and, indeed, undesirable to put in the headers one over another. If plants are intended to be grown upon the wall, the interstices of the stones should everywhere be filled with sweet loam, otherwise any fine soil which can be packed thoroughly solid as the work proceeds will do. Since stones hold water when soil would dry completely out, it is a good plan to mix broken pieces of sandstone or other porous stone of which the wall is constructed with the soil in the larger spaces. A certain amount of trimming is always necessary for coursed walling, however rough, and these trimmings can thus be utilised with profit. If any plants are to be established in the wall, they must be placed in position as the wall is being built, and their roots carefully laid out and made firm in the soil before the next course is laid. Afterwards, if replanting

becomes necessary, which with a properly built wall should not be the case, either the wall must be largely demolished for replanting or recourse must be had to sowing seeds, which ultimately gives first-rate results better results perhaps than putting in plants in the first place, but, of course, needs patience.

The first course of the wall completed and the soil being rammed thoroughly firm in every joint and in the middle of the wall, another course is commenced at the corners in the manner usual with brickwork and masonry, and a builder's line stretched between, to which the remainder of the course is laid. If the wall is a very long one, it will, naturally, have to be built in sections, starting at one end and working to the other, though a considerable length can be laid to one line if a stone is set up at intervals to the correct height for the course, and the line made fast at the correct height with a short piece of string and a stone to keep it in place.

The third course should be super-imposed on the second, just as the second was on the first, and so on until the wall is carried to the proper height, but care must be taken not to omit the tying pieces (or “headers” as we should call them in brickwork) or the plants if planting is intended. Suitable plants for such a wall will be discussed in a subsequent article; suffice it here to state that there is a prevalent tendency to over-plant garden walls. One often sees such walls so smothered that the texture, even the character, of the wall is obscured; this is a sad mistake. Colour schemes for dry walls have been suggested, even employed, but in our view such stilted and artificial arrangements shew a very considerable want of taste on the part of those who perpetrate them. When calculating the necessary width of a partition wall at the base, do not overlook that it has *two* battered sides. Let us take the case of a wall to be 3ft. high and 1ft. 9ins. wide at the top with a batter of 10°. Now the total height of wall which is battered is twice 3ft.—6ft., and in this height the amount of batter at 10° may be taken as 1ft.—that is to say, the wall should be 2ft. 9ins. wide at the base.

A retaining wall is even easier to erect than a partition wall. The section shewn in Fig. 2 indicates the method clearly enough. Sufficient soil must always be cut away to enable the rammer to work freely behind the stones, but this cutting away can best be done as the work proceeds. Walls with a parapet are better reinforced with a little mortar or cement

FIG. 2.—COURSED DRY WALL (AND SECTION)

FIG. 3.—COURSED RANDOM WALLING.

CORRESPONDENCE

THE BEARBERRIES.

I HAVE just read the article in your issue of March 10 on *Arctostaphylos* Manzanita, one of a genus I have long cultivated in spite of the general indifference to native shrubs shewn by gardeners here. I have seen, I think, most of our Californian species in the wild, ranging as they do from sea level to 7,000ft. or 8,000ft. elevation, and in form from low mat-like shrubs to small trees, particularly in the species you describe. I feel, therefore, I have some warrant in venturing to differ with your correspondent's statement that *A. Manzanita* "is undoubtedly the most beautiful member of the family." I think could he see, as I often have, *A. Stanfordiana*, a species with narrow, green leaves bearing no resemblance to the dull blue tone of the *Eucalyptus* and carrying masses of bright pink blossoms or, again, *A. canescens*, with leaves of a beautiful soft grey and large pink flowers, he would at once acknowledge either one to be distinctly more beautiful than the subject of your note. I might add the Spanish name *Manzanita* (little Apples) is derived from the appearance of the fruits, which both in form and colouring are extraordinarily like tiny Apples. —ROBERT MENZIES, *San Francisco, U.S.A.*

ALPINE FLOWER-FIELDS.

IN reply to many English enquiries, I have jotted down the following notes. Will you, perhaps, find room for them in *THE GARDEN*? The flora of the Alps is at its best in the spring—I mean the alpine spring, which comes from middle of May till beginning of July. In summer, when the tourist time is at its height and the alpine climbers at work, the best of the flowers are already gone. This seems overlooked by great numbers of people. If one reads Ruskin's notes, however, one cannot fail to appreciate his admiration for the field of *Gentians* on the Jura in early spring. When I was a boy I fell in love with the blue fields of *Gentiana verna* over the old town of Grandson, and my mind was in such a turmoil that—as my mother said—"I was as in a dream." My friend the great artist Flemwell said in his book, "Flower-fields of Alpine Switzerland," that if ever there is a nervous energy of nature it is in May in alpine regions, and that in May the fields there are a Paradise. Then blossoms *Crocus vernus*, which does not wait till the snow is melted to push its heads out of the frozen ground. They grow in thousands and form sheets of violet and white. Then comes the *Soldanella* in its dark foliage, which is never found far from melting snow. After the *Soldanella* comes the light pink *Primula farinosa* with the Marsh Marigold, *Caltha palustris*, in its alpine form, *C. p. var. alpestris*. At end of May the pastures are thickly sown with flower jewels in a way that neither paint nor ink can portray. The immense fields of *Narcissus poeticus* above Montreux and near Château d'Oex, the glorious masses of *Anemone alpina* which on the limestone Alps and on the Jura extend their royal drapery over all and cover the land with their glory (in the granitic Alps the colour is yellow, and then it is *Anemone sulphurea*)—all these treasures are to be seen at their best towards the end of May. That is why I always advise friends to come from the end of May till the beginning of July. At the time of writing (the end of March) we may see in the very low alpine sites just near to Martigny all the rocks being covered with the deep carmine *Primula viscosa*, which adorns by millions the granitic walls. Again, since the end of January the fields of Alpine Heath (*Erica carnea*) all above Bex and to St. Maurice and then everywhere in the Central Alps are a glorious sight indeed. I would like alpinists to come here at this early season really to enjoy the alpine flora. Just now the fields of *Orchis pallens*, of *Gentiana verna*, of *Potentilla verna* and of Lent Lilies (*Narcissus pseudo-narcissus*) are adorning the pastures above Bex, Martigny, etc. The slopes are brilliant yellow with *Adonis vernalis*, and nothing can express the beauty of them, particularly when mixed with the dark violet *Anemone montana*, which is the granitic form of the Common *Pulsatilla*. —H. CORREVOY, *Floraire, Geneva*.

THE FREESIA ILLUSTRATION IN "THE GARDEN" FOR APRIL 7.

I HOPE no one will think the flowers in the picture represented either the form or the size of the best primrose and yellow varieties that are now in existence. They were some "tail-ends" I sent to the Editor to shew the difference between the yellow of my deepest-coloured seedlings and the so-called "yellow" of Success and Treasure. I am sorry this was not explicitly stated under the illustration, in case anyone should think they are typical flowers which were there represented. —JOSEPH JACOB

[The flowers were somewhat the worse for wear on arrival. The illustration was, of course, intended to shew difference in colouring only.—ED.]

ANEMONE ALPINA IN THE SWISS ALPS.

CROCUS VERNUS IN SWITZERLAND.

THALICTRUM MINUS ADIANTIFOLIUM.

IN a note of mine published in *THE GARDEN* for January 27, in reference to this *Thalictrum*, I said that "of the Meadow Rues it is possibly the least hardy, and to ensure it going through the winter I usually mulch the crowns with coconut fibre in late autumn." The Editor kindly invited expressions of opinion on this point, as he was not aware that it was other than hardy. The correspondents—over a wide area—who have been good enough to reply confirm the Editor's view, and I am pleased to learn that no longer need I take steps to "nurse" my plants, however severe the winter may be. Personally, I am much obliged to those who have written in respect of this beautiful hardy foliage plant.—W. LINDERS LEA.

WHY NOT MORE SPRING FLOWER SHOWS?

ARE not we flower-lovers somewhat lax in our devotion to the floral beauties of spring, at least as expressed in the organisation of spring flower shows—local shows, I mean? Every town, every village runs—more or less successfully—its summer show, in which competition is keen and interest alive and alert. But where—oh! where—in most cases are the floral treasures of the fresh spring-tide gathered together and a "show" which shall be a missionary effort organised? Yesterday, far—very far—from London, I visited a show (one of several in the surrounding districts) devoted to the beauties of the spring, and I bethought me of how much we others miss in foregoing this spring show. Two days of it—mind you, with a military band and other attractions, well patronised and open from 10 a.m. to dark. And the flowers!—from both trade and private growers. "Best collections" of this, that and the other in the bulb world, Primroses, Polyanthus, Violets, cut Rhododendrons, etc., not forgetting table decorations and wild flowers. For nearly three hours I wandered amid those tempting exhibits. Three crowded hours of colour-feast and perfume. Azaleas, Acacias, Freesias, Tulips, Schizanthuses, Cinerarias, Anemones, Ferns and foliage plants. The whole while the question hammered in my brain—"Why?" Why do not the rest of us emulate this noble example? Why should not every town and suburb hold its spring display, either as a separate society or an offshoot of the summer show? It is a golden opportunity, let us be up and doing.—H. W. CANNING-WRIGHT.

SAXIFRAGA CUSCUTÆFORMIS.

ONE has occasional enquiries regarding the hardiness of this pretty late-flowering Saxifrage, but it is not always possible to assure the enquirer that it will stand the winter in his or her locality. Whether it is hardy or not does not depend only upon the climate of the district, but also very greatly upon the nature of the soil and the position the plant occupies. I do not think that it can be relied upon north of the Tweed, or, for that matter, in many districts a long way south of it. There is no doubt that our variable and often wet winters are detrimental to its welfare, and this may be set down as a frequent cause of its demise. When this is associated with a cold, rather heavy soil the loss of this Saxifrage is almost inevitable. It wants a warm position and a thoroughly drained, open, sandy surface soil, with a well drained subsoil, which will allow any surplus rain to soak rapidly from the knob-like little scaly root-stocks, if such we may call them. Then, as it appears as if the old plants die off after a few years of life, we have to depend upon the young ones formed by the shoots

which root in the soil near at hand, or those from the underground stolons. They seem planned to maintain the succession, and to do this it is necessary that these stolons should have a chance of rooting in the soil adjacent to the old plant. It is evident that this cannot be done so well if *S. cuscuteformis* is crowded up among other plants, and it is desirable that it should be surrounded by a space of open light soil to enable these stolons to root freely. Where it is happy this near ally of *S. sarmentosa*, the Mother of Thousands, will soon make a pretty group with its ornamental leaves, its spikes of white flowers, and its numerous progeny thrust out from the parent by means of thread-like stolons. While it can be grown in the open in favoured parts of the country, it is really more desirable for the cool or cold greenhouse, especially the former. The cold greenhouse is not of great value in cool, moist districts, where the damp atmosphere is often injurious to many plants which would thrive if a little gentle heat were supplied. In the cool greenhouse, from which frost is just excluded, it looks remarkably pretty in a hanging pot, and its offshoots can be taken off and struck in small pots if desired. Truly, *Saxifraga cuscuteformis* is not a plant for the many who have no glass, and it is most to be commended to the gardener owning a greenhouse supplied with sufficient heat to keep out the frost and drive away dampness from the atmosphere.—S. ARNOTT.

AN UNCOMMON IRIS.

ALTHOUGH for many years in cultivation and catalogued with fair frequency in bulb lists, *Iris orchoides* is far from common in gardens, even where the less plentiful Irises are appreciated, and it is fairly high in price, a fact which does not say too much in its favour as a commercial plant. Yet it is an interesting and pretty early Iris, of very distinct appearance, and giving its yellow flowers early in spring. This is sometimes its undoing, as I have seen its succulent varnished leaves suffer considerably from late frosts, and when opportunity served and one realised that we were to have an unusually severe frost at night, I have found it profitable to protect this Iris with a bell-glass or handlight. I have grown three forms of this pretty species, one with yellow flowers, another with paler ones, and another with flowers tinged with blue. Of the three I think the ordinary yellow one is the best. It is about a foot or gins. high and does well in sandy soil in sun.—DUMFRIES.

DIANTHUS CÆSIUS AND MICE.

HAVE other readers of *THE GARDEN* noticed that the Cheddar Pink appears to be untouched by mice, whereas the flowering shoots of most (if not all) other varieties are eaten out during the winter? If this observation is borne out by the experience of others, it is a very satisfactory thing to know. I certainly believe it to be a fact in this garden.—F. RIVIS, *Saxmundham, Suffolk*.

[Readers' views on this point would be of interest. *Dianthus cæsius* is sometimes within our knowledge destroyed by voles, but we have had little trouble with mice in the rock garden.—ED.]

A FRAGRANT SHRUB.

I THINK perhaps the enclosed picture of *Osmanthus Delavayi* may interest many shrub-loving readers of *THE GARDEN*. It was sent to me by the Rev. F. Page-Roberts. The plant has been growing outside the greenhouse at Stratfieldsaye Rectory for five or six years. The photograph was taken the week before Easter.—J. J.

[This slow-growing but beautiful and fragrant evergreen shrub seems to prefer a light soil and a rather sheltered situation. As far as present experience goes it is winter-hard, however.—ED.]

FRUIT TREE STOCKS.

MR. J. W. MORTON on page 111 of *THE GARDEN* gives good practical advice as to the selection of fruit trees for various positions and the stock upon which they ought to be grafted, but, unfortunately, when increasing the number of our trees, we are largely in the hands of the nurseryman, who is not always able to comply with the conditions mentioned, and we have

A NICE PLANT OF *OSMANTHUS DELAVAYI*.

perforce to make the best of what he sends us. In regard to Pears that old ditty is quoted

"He who plants Pears,
Plants for his heirs,"

and, whether there is a lot of truth in it or not, where Pear stock is used of one thing I am certain, that it has prevented many from trying to grow them, as I have been in a good few orchards where no Pears had been planted. Enquiry as to this usually elicited the information that it was because of the couplet. But is there not another poetic version of Pears and their culture worth recalling?

"Plant Pears for your heirs
Was a saying our grandfathers knew,
But we have learnt since
If you graft on the Quince,
The Pears will be growing for you."

Mr. Morton, I am pleased to observe, makes mention of Quince stock for Pears. What does it matter if, when so grafted, the trees are smaller? Are the Pears, though fewer in number, less sweet?—W. L. L.

ANDROSACES FOR THE ROCK GARDEN

SEVERAL members of the *Androsace* family may be counted among the most charming of plants suitable for furnishing the rock garden, providing a wealth of beautiful flowers in the early spring and summer months. In the last monograph of the genus by Pax and Knuth they divided it into four sections, of which No. 1, called "Pseudo-Primula," contains thirteen species, the most characteristic members of which are *A. geraniifolia* and *A. Henryi*. No. 2 section, "Chamæjasme," twenty-five species, includes such well known plants as *AA. villosa*, *carnea*, *sarmentosa* and *lanuginosa primuloides*. No. 3, "Aretia," twenty-eight species, is on the whole more difficult to cultivate in this country, and includes *A. helvetica*, *A. glacialis* and *A. pyrenaica*. The last group, No. 4, known as "Andraspis," contains eighteen species, all of which are of an annual or biennial character, the best known being *A. lactiflora*, *A. albana* and *A. maxima*.

Essentially mountain or rock plants, the various members are found on the Alps and Pyrenees of Europe, the mountains of the Caucasus, the Himalayas, Western China and Central Asia. In the latter areas they are found in greater numbers than in Europe, but very few have yet been introduced into cultivation from those regions.

From a cultural point of view the genus may be divided into two groups. In Group 1 the members grow naturally in turf, in pastures, or on dry, stony ledges and slopes; these are the true *Androsaces*. Species of the other group, which has been called *Aretia*, are generally found growing in the fissures of rocks and form the saxatile section. For garden purposes the former group is by far the most important, and is here dealt with.

A. ALBANA is a biennial from the Caucasus, growing about 6 ins. high, with a rosette of leaves which are deeply toothed at the apex. The flowers vary from pink to white, and are produced in umbels in April and May. It is easy to grow in gritty soil.

A. ARACHNOIDEA.—A native of the calcareous Alps of Eastern Europe, it is closely allied to *A. villosa*, but has narrower leaves, while the silky threads instead of being free are confused and matted together. The flowers also are larger and pure white. This species and others of its kindred are typical plants for the moraine, enjoying thorough drainage in gritty soil, providing they are well supplied with moisture during the growing season.

A. CARNEA (syn. *A. Halleri*).—This is a dwarf tufted plant found on the granitic Alps in Central Europe. The narrow leaves are produced in lax rosettes, being slightly glaucous with very short hairs. The flower-stems, 2 ins. to 4 ins. high, bear a small umbel of very bright rose-coloured flowers in May and June. There are several varieties of this species, including *A. brigantiaea* with pink flowers, from the Alps of Briançon; *A. Reverchonii*, with pure white flowers, from Piedmont; and *A. puberula* from Mont Viso. All these like peat and granitic sand, and a partly shaded position. They are best increased by means of seeds.

A. CHUMBYI (*sarmentosa* × *villosa*).—This is very near *A. sarmentosa*, with shorter and very woolly foliage, and large bright carmine flowers in May. It comes from the Himalayas.

A. COCCINEA (*Bulleyana*).—This Chinese species is a biennial, forming the first year a rosette of sessile, spatulate leaves which are glaucous and have ciliate margins. The second year the plant produces numerous scapes with umbels of cinnabar-red and vermilion-coloured

flowers. It is found growing on dry, rocky hill-sides on the Chungtien plateau in North-Western Yunnan at an altitude of 10,000 ft. It does not appear to be hardy, but may be grown in a cold frame in well drained loamy soil with ample drainage.

A. FOLIOSA.—A vigorous species from rocky pastures in the Himalayas at high elevations. It has a thick, stoloniferous stem, with broad, obovate, glabrous leaves, ciliated at the base, in large rosettes. The pink or purple-tinged flowers are produced in umbels, on stems 8 ins. or more high. It does well in rich, moist soil in half shade,

THE PALE COLOURED, BRIGHT EYED, ANDROSACE LANUGINOSA OCULATA.

and flowers from May to August. Easily increased by means of cuttings.

A. GERANIIFOLIA.—A very distinct and pretty species from the Himalayas, with rosettes of rounded Geranium-like leaves on long petioles. The pink flowers are produced in umbels during the summer months. It spreads by means of strawberry-like runners, the tips of which take root and produce fresh plants. It is hardy in sheltered positions, and grows best in rich moist soil in half shade.

A. LACTEA, from the calcareous Alps in various parts of Europe, is a turfy plant with rosettes of narrow leaves. The slender stems, 6 ins. or more high, bear several pure white flowers with a yellow eye in umbels. It is very easy to grow in rich moist soil in half shade, and is easily increased by means of seeds or division. It flowers in May and June.

A. LACTIFLORA (*A. coronopifolia*).—A well known biennial with rosettes of ovate-lanceolate leaves toothed towards the apex. Numerous flower-stems are produced, bearing umbels of pure white flowers from May to September. A native of Siberia.

A. LAGGERI.—This is the representative of *A. carnea* in the Pyrenees, where it is found at an altitude of over 6,000 ft. It is often grown and sold as *A. carnea*, but it is quite distinct from that plant. Forming wide tufts of dark green foliage (not glaucous as in *A. carnea*), the leaves of which are very narrow, it is covered in April and May with umbels of bright pink flowers. It is easy to grow in the rock garden with moraine-like conditions, and is more partial to sun than some of the others. Few plants form such a charming picture as a well grown pan of this species in the alpine house; it is most suitable for growing in this way.

A. LANUGINOSA.—A native of the Himalayas and one of the most valuable plants in the genus. The stems are of trailing habit and freely furnished with ovate, acuminate leaves that are thickly covered with soft, silky hairs. The stems after growing a bit produce umbels of delicate pink flowers, each of which has a yellow eye. In this way a succession of bloom is produced over a long period in the summer months and well into autumn. *A. l. var. oculata* has white flowers with a yellow eye. One of the easiest plants to grow, it is quite at home in a sandy compost of loam and peat, to which has been added some mortar rubble. It may be used for clothing rocky ledges in full sun in the rock garden or even old walls and rocky slopes. It dislikes damp in winter, and should be provided with ample drainage. Seeds are produced freely, and it may also be increased by means of cuttings in summer.

A. SARMENTOSA.—This is the type of a group, the various forms of which are found in the Himalayas. It grows in rocky pastures over a wide area from Sikkim to Kashmir at elevations of from 11,000 ft. to 14,000 ft. Some of the forms approach the well known *A. lanuginosa*, but *A. sarmentosa* is less silky than that species, and has larger rosettes of broader leaves; it also produces stolons, which root as they spread, soon forming large carpets. The flower-stems, about 5 ins. high, appear in April and bear umbels of deep lilac-coloured flowers, which have paler eyes. It is one of the easiest of this set to grow, doing well in gritty loam in a sunny position. *A. Watkinsonii* is a form of this, with larger rosettes of silky leaves. *A. primuloides* is another form from Kumaon, with rosettes of silky villous leaves, compact in habit and usually without stolons. It has bright carmine flowers. *A. sarmentosa*

var. *grandiflora* (syn. *A. strigilosa*) is a stronger-growing form with larger flowers.

A. SEMPERVIVOIDES.—A neat little spreading plant from the Himalayas with sempervivum-like rosettes of leaves and rosy purple flowers in umbels in May and June.

A. SPINULIFERA.—A strong-growing species from Western China with rosettes of leaves in the way of *A. foliosa*, having a spiny tip. The stout scapes, covered with hairs, reach a height of nearly a foot, and bear umbels of delicate rose-pink flowers twenty to thirty in a head. So far as my experience goes it dies after flowering.

A. TIBETICA is a charming little plant that was introduced from Kansu in Northern China. It is somewhat like the Himalayan *A. sempervivoides*, but has broader leaves and the whole plant is more softly hairy. The hairy flower-stems

are about 2 ins. long and bear umbels of from six to nine white flowers having a yellow eye. Quite hardy, it will grow under the same conditions as *A. villosa*.

A. VILLOSA.—This pretty little species has a wide distribution, being found on the mountains of Europe and Asia. It makes mats of small rosettes of densely woolly leaves, and in May and June bears its umbels of pale pink, or almost white flowers, with deeper coloured centres.

A. VILLOSA VAR. CHAMEJASME is a form with flowers that open pure white, but gradually become bluish pink with age. Both these like a very gritty soil in full sun, and are charming plants for the moraine.

The species and varieties above enumerated are not an exhaustive list of the members of this genus in cultivation, but only some of the best and more easily grown kinds. W. I.

GARDENING OF THE WEEK

FOR SOUTHERN GARDENS.

The Hardy Fruit Garden.

Peaches and Nectarines.—The disbudding of both Peaches and Nectarines must be proceeded with directly the shoots are large enough for removal. It is a mistake to allow them to become any length before the operation begins and, moreover, it should be done gradually; the same remark applies to the thinning of the fruit. When disbudding it ought to be borne in mind that the shoots retained will constitute the fruiting wood next year, so the object should be to leave sufficient well placed growths without unduly overcrowding the tree.

Blister or Leaf-Curl.—This disease is often present, and it usually appears after a cold east wind. All infected leaves should be picked off, and the trees usually improve with more congenial weather.

Mildew.—This is another trouble with Peaches growing in the open, and it is often caused through dryness at the root, so it is advisable to pay due attention to watering, afterwards mulching the base of the tree with manure to conserve moisture. Gishurst Compound is a useful cure and preventive for mildew if the instructions as to strength are carried out.

General Work.—Cleanliness is an important factor in successful fruit culture, and not only must insect pests be dealt with, but weeds must be kept in check. The soil between the trees should be hoed or lightly forked over at intervals, and everything done to render the fruit garden clean and tidy.

Fruit Under Glass.

Strawberries.—At this season Strawberries in pots require a lot of attention, especially if they are arranged on shelves in vineries or peach-houses. They will need frequent applications of water, and those that have just set their fruits may be given occasional waterings with liquid manure, while the syringe must be used freely to hold in check red spider, a pest which is very partial to Strawberries at this period of the year. There is always a danger of the pest spreading to other plants, but this must be prevented even if it involves moving the plants to another structure away from the Vines and Peach trees. Plants ripening their fruits must not be syringed, and these may be accommodated in a cooler house, while the last batch of pot Strawberries will succeed in a cool house or pits. When the fruits have been gathered, the plants should be stood in a cold frame for a few weeks and then planted out in a bed, otherwise they should be thrown away.

The Kitchen Garden.

Marrows.—About this date a liberal sowing of all kinds of Marrows should be made to furnish the main crop. The seeds may either be sown singly in small pots or a number in a box or pan, but whichever method is adopted they should be raised in a warm greenhouse and later on transferred to a cold frame to harden off. The young plants must not be starved while in small pots, as they rarely recover when planted out.

Peas.—A further sowing of Peas should be made to keep up a continual supply, and second

early varieties should be selected. Earlier sowings must be given sticks before they begin to fall over, and when time permits the stakes may be placed in position soon after the seeds are sown.

Carrots.—The main or principal sowing of Carrots should be made in drills 1 ft. apart. Give the soil a sprinkling of soot or ash from the rubbish fire and rake the ground to produce a fine surface and free it from large stones. When large enough thin out the seedlings to 6 ins., but this applies chiefly to the intermediate kinds, the stump or horn varieties being thinned for the kitchen as the necessity arises.

Turnips.—During the next month or two an occasional sowing of Turnip seed should be made to keep up a supply of crisp young roots. Sow in shallow lines 1 ft. to 15 ins. apart, and thin the seedlings before they become overcrowded.

Lettuce.—Make fortnightly sowings and transplant the seedlings before they become leggy. When doing this care should be taken to prevent injury to the main root, or the young plants take a long time to recover.

Runner Beans.—An early supply may be obtained by sowing under glass and then planting out when all danger of frosts is past. Seed may either be sown in boxes or small pots and then placed in a warm greenhouse until germination has taken place. A cold frame will then accommodate them, removing the lights during the day.

The Flower Garden.

Bedding Plants.—Latterly the houses and heated pits have been crowded with plants destined to occupy the beds during the summer months. Now every cold frame should be used for the purpose of hardening them off, and such plants as *Pelargoniums*, *Lobelias* and *Marguerites* if well rooted should be moved during the next week or two. Frames cleared of Violets, etc., will be found useful for pricking off *Phlox Drummondii*, *Nemesias* and *Antirrhinums*.

Pentstemons.—These may be set out in their flowering quarters at once, which will relieve the work of bedding out in May and, moreover, enable the plants to become established before the hot weather arrives.

Sunflowers.—The large-flowered kinds are well adapted for the back of herbaceous borders and as clumps in shrubberies where space is available. The seeds should be sown where the plants are intended to flower.

Shrubs.—Both Holly and Yew may be transplanted at this season. Keep the roots moist during the operation.

F. W. BRISCOE
(Gardener to W. R. Lysaght, Esq.)
Castleford, Chapstow, Gloucestershire.

FOR NORTHERN GARDENS.

The Kitchen Garden.

Seakale Beet.—This vegetable is not of high value, but it has two points of merit: It sometimes comes in handy as a stopgap and it supplies two distinct kinds of dishes. The leaf-stalks supply a substitute for Seakale and the leaves for Spinach, being actually superior to the variety known as Spinach Beet. Lett in the ground over winter the leaf-stems are most

tender when the plant starts to grow afresh in late spring, when there is not otherwise great choice of variety. Sow from now to the first week in May in lines 15 ins. or 16 ins. apart, thinning the plants out in due course to 9 ins. apart.

Seakale.—Where the crop or part of it has been mildly forced *in situ* the protecting material should be duly removed. The ground should then receive a fairly liberal dressing of organic manure, and if seaweed is available it should form either the whole or part of the dressing, or, failing this, a moderate dressing of salt should be added.

Celery.—It is good policy to form and prepare the trenches now. By this arrangement a crop of Lettuces may be sown or planted in the space between the trenches and used or so far used that they will not interfere with the operation of earthing up the crop. Trenches may be formed of breadths varying from one for a single row of Celery to one that will accommodate five or six rows. Celery trenches are frequently made too deep, often accounting more or less for the crop rotting. In its natural habitat the whole of the plant except the root grows above ground; earthing up is one of man's "many inventions." When the manure is dug in the bottom of the trench it should not be more than a few inches below the ground level.

The Flower Garden.

Dahlias.—See that the ground is in readiness for their reception a few weeks hence. Dahlias are gross feeders, and for their successful cultivation demand a rich, deeply worked soil. The plants, whether young or old, should now be in cold frames being hardened off. Old roots should have plenty of flaky leaf-mould worked in among their roots so that they will suffer little check when planted out. These old plants generally send up several leading shoots, and these should promptly be reduced to two at most.

Fragrant Plants.—These are always acceptable, especially to the ladies. "The scented garden" is a feature in some establishments, but short of this it is desirable to have them in greater or less quantity near to the main entrance to the garden. The following readily occur to one's mind: *Melissa officinalis* (Bee Balm), *Cedronella cana*, both hardy. Among half-hardy plants there are *Cedronella triphylla* (Balm of Gilead), *Aloysia citrodora* (Sweet-scented Verbena), *Heliotrope*, Pheasant's Foot *Geranium*, *Nicotiana glauca* (annual) and the popular hardy annual, the Night-Scented Stock, *Matthiola bicornis*.

Fruit Under Glass.

Vines.—Promptly pinch out all sub-laterals as they appear. In a house started in early February the night temperature should now be about 60°. Close the houses in time to imprison a certain amount of solar heat; it is superior to fire heat, besides being more economical. Thoroughly damp down the house at closing time, putting on a chink of air for the night later on. Keep an eye on the foliage, which will be fairly thick and leathery if the culture has been correct; if rather thin, be a little more liberal with the ventilation.

Peaches and Nectarines.—Employ the syringe rather vigorously at closing time as a preventive against thrip or red spider. See that the trees do not suffer for lack of water at the root, and as successional shoots develop in early houses tie them in promptly. Thin the fruit gradually in late houses, commencing as soon as they attain the size of small marbles. They should ultimately be thinned out to about a foot apart.

Melons.—Support the fruits by means of the "melon net" as soon as they attain the size of a pigeon's egg and promptly pinch out all young growths. Assist the swelling of the fruits by bi-weekly applications of a mild liquid manure. If roots show on the surface, give a light top-dressing.

CHARLES COMFORT
(Formerly Head-gardener to Mrs. Haig, Broomfield, Davidson's Mains, Midlothian).

GREENHOUSE AND CONSERVATORY.

Alberta magna.—This plant is a native of Natal and is generally given warm house treatment, but I find it does much better when planted out in a conservatory where the night temperature during the winter is as low as 40° to 45°. It is a handsome shrub or small tree with dark green glossy leaves, and is now producing its red flowers in quantity. It is generally regarded as a difficult plant to propagate, but I find it roots readily from quite young soft shoots inserted in pots of sandy soil and plunged in a close case with slight bottom-heat.

This New Continuous Sprayer

These illustrations clearly show the unique features of this New Sprayer, including detachable Barrel and adjustable and detachable Jet. The Spray is CONTINUOUS and suitable for use with Insecticides for spraying Roses, Fruit Trees, etc.; also for Disinfectants, Fly-killing compounds, &c., in Houses, Factories, Workshops, Ships, Cinemas, &c.

The Jet may be varied from a coarse spray to a very fine mist by merely turning an adjusting screw; every part is easily detachable and accessible for cleaning purposes, and all working parts being interchangeable can be renewed at small cost.

Undoubtedly the finest mist Sprayer on the market.

This FREE Book tells you how to Begin Beekeeping

This little Bee Book is written by experts in simple, non-technical fashion to tell beginners all about beekeeping as a profitable and pleasurable hobby.

It is plentifully pictured by photographs and sketches, and simply, clearly and concisely explains all that the beginner wants to know about bees and the modern hive. Published by Taylors of Welwyn, the largest apiarists in Europe, it is offered quite free to every reader who writes asking for it.

It will tell you the secrets of successful beekeeping, and how you can begin now at a small outlay in time for this season's honeyflow.

Write for your copy of the "Little Bee Book"—NOW.

E. L. TAYLOR, LTD.,
Beehive Works, WELWYN, HERTS.

Burchellia capensis is a South African plant which produces tubular orange-scarlet flowers. It is a plant that does not take kindly to pot cultivation, but is seen at its best when planted out in a well drained bed in a cool conservatory. It should be planted in a compost of light loam with the addition of some fibrous peat and sand. This plant is easily propagated by means of cuttings of half-ripened shoots. Unfortunately, it is very subject to attacks by mealy bug, which must be guarded against.

Winter-Flowering Begonias as represented by such varieties as *Optima*, *Exquisite* and *Mrs. Heal* are difficult plants to bring safely through their resting period, and although the worst time is now past, they still require very careful treatment. Care should be taken not to allow the plants to become too wet at the root. The young growth that is beginning to show signs of breaking from the base should be encouraged by being sprayed lightly several times a day during bright weather. Next month one should begin to get a supply of cuttings, which should be secured when they are about 3 ins. to 4 ins. in length. These are best inserted singly in small pots of light sandy soil, plunging them in a warm case with slight bottom-heat at command. When rooted they should be grown on in an intermediate temperature, taking care not to overpot them.

Begonia socotrana, which is one of the parents of this group, apart from its interest as such, is well worth growing from the decorative point of view, and it should be started into growth about the middle of May. It has no tuberous roots, but forms fat buds on top of the soil. These buds carry the plants through the resting period. Each bud is capable of producing a plant, but where good specimens are required clusters of three or four buds should be potted up in a light rich compost. Give very little water until they have started into growth and made a quantity of roots. They are best grown in a temperature of 60° to 65°. In common with all *Begonias*, mite must be guarded against by the use of the sulphur vaporiser.

Prostanthera rotundifolia is a beautiful pot plant for a cool greenhouse or as a large specimen planted out in a cool conservatory. It produces its beautiful purple flowers very freely, and in the South and West at least is nearly hardy, standing most winters if planted against a warm wall. This plant is easily propagated by means of cuttings of half-ripened twiggy shoots which root freely under a bell glass in a cool house. The young plants should be stopped several times to induce a bushy habit. After flowering, the long shoots should be cut back, but the species is somewhat impatient of the knife and old plants do not start readily after being cut back. It is therefore necessary to have a succession of young plants coming on. *P. lasianthos* is another beautiful species and, like the former plant, is nearly hardy in favoured localities. It is, however, a very different plant from the former, having long, slender shoots with narrow leaves. Unfortunately, it is a very difficult plant to propagate, the cuttings forming a large callus. However, by keeping this callus pared down a proportion of the cuttings may be induced to form roots. *P. nivea* is a slender-growing species, having white flowers tinged with pale blue. This species and *P. lasianthos* make fine specimens if planted out in a well drained border in a cold house.

Mosehosma riparium.—This beautiful winter-flowering plant should be propagated by means of cuttings at this time. The cuttings root readily in a slightly heated case, and the young plants should be potted on until they are in 6 in. or 7 in. pots. During the summer months they only require ordinary greenhouse treatment. This plant suffers very quickly from fogs, and in this neighbourhood usually gets spoiled just as it is coming into flower.

Royal Botanic Gardens, Kew.

J. COUTTS.

EDITOR'S TABLE

FROM MESSRS. Storrie and Storrie (of tiny seedling tunic), Glencarse Nurseries, came quite a posy of giant *Primula obconica* blossoms. The range of colouring is good, but not exceptional; the flowers and trusses are shapely and of fine size, and they are borne on fine stout stems. Some of those sent measured 13 ins. Quite the most attractive of those included was a white form of quite exceptional size, form and purity of colour.

Peter Barr Memorial Cup.—At the meeting of the K.H.S. Narcissus Committee the Peter Barr Memorial Cup, which is annually held by someone who has done good work among Daffodils, was unanimously awarded to Mr. Charles H. Curtis, who for the past twenty years has acted as hon. secretary to the committee and has done a great deal of valuable work in the classification of Daffodils and in compiling the official lists.

Horticulture by Wireless.—It may be that the day is not far off when the debates in Parliament will be broadcast, at any rate the British Broadcasting Company are quite catholic in their programmes, and a lecture on Roses was included on April 7 by Mr. Laurence Cook of Messrs. Stuart Low and Co., Bush Hill Park. He dealt with the various phases of their cultivation and on points of individual varieties, and made a strong point of the fact (not always sufficiently appreciated) that horticulture gives a better return for the time and money spent upon it than any other hobby. He warned his 50,000 "listeners in" that those who had been tempted by cheap offers of Dutch Roses would be disappointed, as the soft, sappy trees grown on the moist, sandy and peaty soils of Holland are never satisfactory in this country, as they die back badly.

Revival of Kirkcudbright Flower Show.—At a meeting held on April 3 Provost M'Alister, Kirkcudbright, presiding, it was agreed to resuscitate the flower show, which has been moribund for some years. It was resolved to have a show this autumn, and that the prizes be not in money but in cups and medals. The show is to be confined to the stewardry of Kirkcudbright, and the name of the organisation is to be the Kirkcudbright Horticultural Society. In addition to a large committee, the following office-bearers were appointed: President, Mr. R. Waugh; vice-presidents, Sheriff Napier, Mr. E. A. Hornel, Dr. Stewart, Mr. S. Campbell and Mr. Milburn, Mr. J. Kelly and Mr. G. Houston were appointed joint secretaries and treasurers.

Arrangements for the Great Glasgow Show.—Arrangements have been completed for Scotland's premier flower show, which will be held in the Kelvin Hall, Glasgow, on September 5, 6, 7 and 8 next. The prize list has been completed and schedules are now being issued. Like the successful show held last year, it is promoted by the Corporation of Glasgow in conjunction with the Glasgow and West of Scotland Horticultural Society, and is certain to command the same public patronage, while the number of competitors should be, if anything, more numerous. There are in all something like 400 classes divided into sections and, apart from valuable trophies, gold, silver and bronze medals, £1,500 will be awarded in prizes. For the best rock or rock and water garden arranged on the floor level in a space 30 ft. by 15 ft. £100 will be given in four prizes. A similar amount will be awarded in the pot plant section for the best groups of miscellaneous stove and greenhouse plants arranged for effect on the floor. The winner of the first prize will be presented, in addition to the money award, with the Corporation of the City of Glasgow Challenge Cup value £50. In the fruit section £70 is given in four prizes for the best decorated fruit table, the first prize also including the *Glasgow Herald* Challenge Cup value £40. Entries, which close on August 22, are to be lodged with Mr. J. Carriek Kerr, 38, Bath Street, the new secretary of the Glasgow and West of Scotland Horticultural Society.

An International Gladiolus Show.—We are informed that there will be held in the City of Guelph on August 22 and 23 of this year an International Gladiolus Show. Much interest is already being manifested in this Show, both

on the part of the Ontario Government and also by horticulturists all over Canada and the northern part of the United States. In Guelph is situated the Ontario Agricultural College, and the Ontario Government is placing at the disposal of the Ontario Gladioli Society a piece of ground at the college in which it is hoped the various centres of Europe which are famous for their Gladioli will become interested. Trial plots for growers and hybridisers are to be maintained by the Ontario Government, and every possible care will be given to these plots by competent horticulturists attached to the Ontario Agricultural College. Bulbs for planting may be sent in lots of one hundred and less from each grower, and every care will be taken properly to plant and mark with the grower's name the exhibit sent. In this way all the bulbs that come from Britain will be maintained in one plot, and from other countries in a like manner. To ensure being included, bulbs must be in Guelph not later than May 24 next, and those coming should be addressed to Mr. J. E. Carter, Chairman, The Plot Committee, Guelph. The Society will be responsible for arranging the exhibit from these plots at the show in August, and every possible care and attention is promised in this regard. The promoters hope that many growers and hybridisers from these islands will send bulbs.

ANSWERS TO CORRESPONDENTS

FLOWER GARDEN.

CRINODENDRON HOOKERIANUM (M. M.).—Formerly this was treated as a greenhouse plant, but it will thrive outside in this country if planted in a fairly warm position and in a well drained soil. Our correspondent can obtain leaf-soil, peat and grit, and these ingredients should be added to the soil liberally if the latter is clayey, in moderate quantities if it is naturally of a light nature. The rooting medium must be made firm.

GROWING A WISTARIA PLANT IN A POT (A. M. G., Pitlochry).—The plant should be grown in a compost of light loam with a small proportion of peat, and potted firmly in a well drained pot. During the stage when growth is free several applications of diluted liquid manure will be beneficial. When growth matures the pots must be protected from frosts, and early in January the shoots must be cut rather hard back, somewhat similar to the pruning of Hybrid Perpetual Roses. The plant should never suffer from lack of water during the season of active growth.

ROSE GARDEN.

ABOUT PRUNING ROSES (A. G. M., Staffs).—It is rather late to prune Roses generally, but in our correspondent's county the work may be done now. Shoots which grew last year of the varieties named by our correspondent, viz., Lady Ashton, Edgar Page and General McArthur, must be cut back to four or five buds. This remark applies to similar varieties. The new shoots growing now will not bear fine blooms even if they escape late frosts. If the variety Hugh Dickson is in the collection, some of the strongest shoots may be pegged down, as very fine blooms will result from the majority of the buds.

FRUIT GARDEN.

NETTING STRAWBERRY-BEDS (E. M. J., Surrey).—A good way to protect the Strawberries from the birds is the one suggested by our correspondent. Birds can pass through quite small-meshed wire netting, so that, to be safe, the side wire netting should be half-inch mesh. Make this secure to the ground by pegging. In rows, 6 ft. from stake to stake, drive in sufficient to bear the string nets; the top of each stake should be covered with moss, hay or grass tied on securely. The string nets can be put on or drawn off then without being caught up and torn. These net-bearing stakes should be 1 ft. higher than the side wire netting to enable anyone to gather the fruit in comfort.

MISCELLANEOUS

NAMES OF PLANTS.—J. H., Bonchurch.—1, *Juniperus chinensis*; 2, *Enonymus pendulus*; 3, *Skimmia japonica*; 4, *Choisya ternata*; 5, *Pittosporum Tobira*; 6, *Hedysium Solerolii*.—E. C., Somerset.—*Salix alba* var. *vitellina*, "Golden Willow."—A. C., Kent.—*Corydalis tuberosa* alba (C. cana).

BENSON'S GARDEN HOSE**SPECIAL 1923 OFFER.**All Hose is made 60ft. lengths. **BEST HAND-MADE GARDEN HOSE,** 60ft. best Red or Grey 2, with all best Brass Fittings, **18 6 COMPLETE.** This is Hose much superior to the common drab quality usually sold.**"SPECIAL RED" or GREY HOSE.**

60 ft. 1/2 in., fitted with Branch Rose and Jet and Royle's pattern Tap Union,	22 6
60 ft. 3/4 in., " " " " " "	26 6
60 ft. 1 in., " " " " " "	32 9

This Hose is very superior, both in make and finish, to anything of the kind hitherto made. The rubber inside is seamless, thus avoiding the possibility of splitting or opening of seams which occurs with the ordinary make; also, being well frictioned on to the canvas during the process of manufacture, it is not liable to peel off. It is calculated to stand much greater pressure than the ordinary Hose, combining lightness with strength.

THE PRIMULAS OF EUROPE

With Botanical Classification, Descriptions, and Cultural Instructions

By **JOHN MACWATT, M.B.**

Crown 8vo., Cloth, **12/6** net; Postage 9d. extra.

The aim of the author has been to produce a handbook that will assist in the identification of those species of the genus *Primula* which are native to the European continent, and at the same time furnish practical guidance to the cultivation of such of them as have been introduced to our gardens where conditions differ so widely from those prevailing in their natural habitats.

Dr. MACWATT is an acknowledged authority on *Primulas*, and his book presents in a concise and interesting manner the results of many years of close personal observation and experience.

Published at the Offices of "COUNTRY LIFE," LTD., 20, Tavistock St., Covent Garden, London, W.C.2.

LADIES' FIELD FASHIONS

The Ideal Dress Journal for the Modern Woman

Every issue of "Ladies' Field Fashions" presents the newest season's modes adapted to the needs of the smart woman of to-day. Prominent Fashion Artists picture in terms of simplicity and smartness the latest creations from the acknowledged centres of fashion, whilst style experts advise authoritatively on all matters of dress. An exclusive feature every month is a beautiful Colour Supplement picturing a variety of charming and wearable styles.

BENSON'S GARDEN HOSE

SPECIAL 1923 OFFER.

All Hose is made 60ft. lengths. **BEST HAND-MADE GARDEN HOSE**, 60ft. best Red or Grey $\frac{3}{4}$ in. with all best Brass Fittings, 18 6 COMPLETE. This is Hose much superior to the common drab quality usually sold.

"SPECIAL RED" or GREY HOSE.

60 ft. $\frac{3}{4}$ in., fitted with Branch Rose and Jet and Royle's pattern Tap Union, 22 6
60 ft. $\frac{3}{4}$ in., " " " " " " " " 26 6
60 ft. $\frac{3}{4}$ in., " " " " " " " " 32 9

This Hose is very superior, both in make and finish, to anything of the kind hitherto made. The rubber inside is seamless, thus avoiding the possibility of splitting or opening of seams which occurs with the ordinary make; also, being well frictioned on to the canvas during the process of manufacture, it is not liable to peel off. It is calculated to stand much greater pressure than the ordinary Hose, combining lightness with strength.

This FREE Book tells you how to Begin Beekeeping

Profitable
Bee-Keeping
for Beginners.

This little Bee Book is written by experts in simple, non-technical fashion to tell beginners all about beekeeping as a profitable and pleasurable hobby.

It is plentifully pictured by photographs and sketches, and simply, clearly and concisely explains all that the beginner wants to know about bees and the modern hive. Published by Taylors of Welwyn, the largest apiculturists in Europe, it is offered quite free to every reader who writes asking for it.

It will tell you the secrets of successful beekeeping, and how you can begin now at a small outlay in time for this season's honeyflow.

Write for your copy of the "Little Bee Book"—NOW.

Notes from Maidstone.

THE CALL of SPRING

At no time is the call of the garden more clamant than in those lengthening days when April turns to May. The weevil now leaves his watery nest and turns to seek his mate: the aphid, long immured in her dark egg, creeps out to fulfil urgent domestic calls.

But what is life to the weevil is death to the fruit & death's avenging hand may not be stayed.

Timely advice on such letal matters is contained in our pamphlet on *Pests of Orchard and Garden Crops*—1d. post free.

PLANTS FOR THE HEATH GARDEN.

THE Swedish botanist Linnæus is said to have knelt in thankfulness to Heaven when his eyes first saw the glory of the Gorse in blossom on an English common. This joy of a secret communion with nature, a joy akin to tears, that touches the very strings of the heart, is well understood by those who return again to see the Heather on the Yorkshire moors or the purple hills of Scotland. People who have the Heather always with them love it for other qualities besides its long persistent blooms. They admire its sturdiness, its sober self-respect; in a word, its truly British nature. It is the home of the red grouse, which feed upon its seeds and tender shoots; of the mountain sheep, famous for their delicate taste of the Heather; and of innumerable honey bees. It is useful for building the walls and thatch of a shieling, and to make brooms and brushes and baskets. Its roots serve for a peaty fire, and its branches for a soft and fragrant bed.

On rolling ground, where the soil is a sandy peat, a garden can be furnished entirely with beautiful ericaceous plants. Azaleas near the windows will fill the house with sweetness. Shelter belts can be made of *Arbutus* and *Kalmias* and *Andromedas*, with *Rhododendrons* a little way off. Other plantings can be made of the *Gaultherias*, *Arctostaphylos* and *Vacciniums* with Heaths and Fings, some as shrubs of different sizes, others forming a carpet beneath the whole. Even where room cannot be spared for these extensive plantations there are many places in which Heaths can be used to advantage. Some are dwarf and compact enough to form edgings for beds. Others can be massed in front of shrubs or on the rockery, and taller-growing kinds behind or above them; while they are also useful for beds on the

lawn or where lawn and wood meet. At Kew they are planted in large masses beneath trees and shrubs of more than ordinary interest, which require a little protection while they are young. The branches of the Heaths give this protection, and neither is seriously incommoded by the other.

The first thing to consider when choosing a place for a heath garden is the nature of the soil. In a wild state Heaths are sometimes found on soils containing lime, but it is not easy to establish a plantation on such land, and even when new soil is brought in for the purpose the results are generally disappointing. They thrive excellently in sandy peat, but peat is not always necessary for their well-being, for they will often grow in light or even rather heavy loams, especially when leaf-mould is incorporated with the soil at planting-time. Heavy and wet clays are unsuitable.

Heaths may be grown either in full sun or in partial shade. Hilly or rolling ground forms the most appropriate foundation for an attractive heath garden, and on level ground a judicious mixing of the tall and low-growing kinds gives

an undulated appearance, which is so essential to the best results. Pine trees help materially in the production of a natural scene, and so do rocks or even large stones. When Heaths are planted on the outskirts of the garden proper, Brooms, dwarf Gorse, Scotch Roses, Common Juniper and other British plants may be allowed to approach and mix with the Heaths. Here the paths should be quite informal, and may consist of short grass with tufts of Heather or stepping-stones in places.

No elaborate preparation of the ground is needed by Heaths. The ground should be dug over, and jins. of decayed leaves or peat may be spread over the surface and lightly forked in. Should coarse weeds be present, such as Bindweed, Goutweed, Couch Grass or Nettles, they should be forked out carefully, for if they once become mixed with the Heaths they are most difficult to eradicate, and if some other crop can be placed on the ground for a few months before the Heaths are planted so much the better. Upon no account excavate beds 12ins. or 15ins. deep and fill them with unmixed peat. When this is done the peat

decays before the roots can take advantage of it, and then it acts as a poison. The most suitable soil of all is that formed by forking a little peat into light, rather sandy loam.

The planting may be done at any time in open weather from early autumn till late spring. Plants which have been put out in late spring require much attention in watering if the weather should be very dry during their first summer. If the cultivator does not mind the ground being rather bare for a year or two, plants may be placed 18ins. or 2ft. apart each way, and even that will be too close eventually, for the larger-growing kinds may spread over an area

SPRING IN THE HEATH GARDEN AT BROCKHURST, EAST GRINSTEAD.

The picture well shows the variety of outline obtainable.

of 6ft. or more, but it is better to thin out later than to plant very thinly at first.

The pruning takes the form of cutting the plants over just below the flower-heads as soon as the flowers fade. This is quite enough to keep the plants compact and healthy. It is no use to cut old straggling plants back into hard wood to induce new growth, but better to destroy them and begin again with young, vigorous stock.

Propagation can be effected in several different ways. All the distinct species can be increased by seeds, while both species and varieties can be grown either from cuttings or layers. Seeds may be sown as soon as ripe, or kept in a cool room until the following February. Should a small quantity of plants only be required, the seeds may be sown in a small pot or pan indoors, but if many are wanted they are sown in boxes or in a prepared bed in a cold frame. Provide good drainage, use sandy peat made very fine on the surface, sow the seeds thinly, and if they are covered with soil at all let it be by a very shallow layer. Water carefully and shade from bright sun until germination takes place. As soon as the seedlings can be handled, prick them out in, apart each way in boxes of sandy soil containing peat or in a bed in a cold frame. Thin the points of the shoots out now and then to induce a dense, bushy habit. Eventually place the plants in nursery borders until they are large enough for permanent places.

Layers are put down during spring or early summer. The branches are not cut like Carnation layers, but are weighted down with stones into sandy soil. They take about two years to become well rooted, and are then removed and planted in nursery borders.

Cuttings form better plants than layers, their growth usually being cleaner and more vigorous. Cuttings are taken from short side shoots during July and August. They are usually made from 1in. to 1½ins. long, the leaves being carefully removed from at least half of each cutting without injuring the bark. They are set in sandy peat either in pots indoors under bell glasses or in close propagating frames, or out of doors under cloches in a well prepared border. In the former case roots are formed in from four to six weeks. In the latter case they are slower, and are left undisturbed until the following spring. In either case the soil must be made very firm and the cuttings inserted quite firmly. A layer of silver sand placed over the surface of the soil before inserting the cuttings is an aid to rooting. When the cuttings are well rooted they are transplanted into cold frames or borders.

The Heaths include three genera—*Erica*, *Calluna* and *Daboecia*. All the hardy kinds are of European origin, and several are natives of the British Isles. *Erica* contains many species, *Calluna* and *Daboecia* only one species each, although there are numerous varieties.

Erica has a very extended flowering season, and it is rarely that one or more kinds cannot be found in flower in gardens where a full collection of varieties is grown.

As a guide to intending planters the various Heaths are here arranged in their seasons of flowering.

The early-flowering group contains kinds which bloom between the end of November and May, and includes *Erica arborea*, *E. australis*, *E. carnea*, *E. darleyensis*, *E. lusitanica*, *E. mediterranea* and *E. verticillata*.

The mid-season group, which flowers during June and July, consists of *E. ciliaris*, *E. cinerea*, *E. Mackayi*, *E. scoparia*, *E. stricta*, *E. Tetralix* and *Daboecia polifolia*.

The autumn-flowering kinds are *E. ciliaris* var. *Maweana*, *E. multiflora*, *E. vagans* and *Calluna vulgaris*.

Erica arborea is the White or Tree Heath of South Europe and North Africa. Its roots are used to make briarwood tobacco pipes, the wood briar being the French *bruyère*, or Heath. It usually grows between 6ft. and 10ft. in height, though under exceptional conditions, as in the famous gardens of Treco Abbey, it forms a tree 18ft. or 20ft. high. Its branches are spreading and plume-like, and are closely covered with tiny leaves. It blooms from early March until May, and the fragrant white flowers appear in small tuft-like clusters from the short growths formed the previous year. It has been known to withstand 20° of frost without serious injury, but it is wise to give it the protection of spruce boughs or bracken when more than 15° or 16° are registered. The variety *alpina* is of more plume-like habit than the type, although of somewhat stiffer outline. The leaves are a pretty shade of green, the white flowers are borne freely, and it is rather dwarfer and hardier than the type.

E. australis also belongs to the Tree Heaths, although it is of comparatively dwarf stature, rarely growing more than 4ft. or 5ft. high. It is of rather straggling habit, which severe pruning does not improve to any appreciable extent. Its large, red, cylindrical flowers appear in clusters on short shoots from end to end of the branches, and last from March till May. It is sometimes called the Spanish Heath, being a native of Spain

THE PINK-BELLED ARCTOSTAPHYLOS UVA-URSI MYRTIFOLIA.

A BEAUTIFUL "LILY-OF-THE-VALLEY SHRUB"—ZENOBIA SPECIOSA

and Portugal. Although introduced as long ago as 1760, it is not very common, and has been lost to English gardens more than once. Like other species from South Europe, it is injured by very severe frost, but is an excellent plant for the milder parts of the country.

E. carnea from the Alps of Central Europe is hardly everywhere throughout the British Isles. It rarely grows more than 6ins. or 9ins. high, but spreads widely and forms a dense carpet. The purplish red flowers are borne in profusion from February to May, during which time it makes a very pleasant picture, either naturalised in masses or grown as groups in the rock garden. The variety *alba*, with white flowers, blooms at the same time.

E. ciliaris is one of the least useful kinds for garden planting, owing to its long, wiry branches often becoming untidy. A native of south west Europe, it is found wild in many parts of the British Isles, where it inhabits commons and boggy land. It is sometimes quite prostrate and sometimes reaches a height of 9ins. or 12ins. Its thin, wiry branches and small ovate leaves, edged with fine hairs, make it easy to recognise, while its rather large, reddish flowers arranged in upright racemes are distinct. It blooms from June to October. The variety *Mawiana* is a very handsome Heath from Portugal which blooms a little later. It differs from the type in its rather close, upright habit and in its dense racemes of large, red, inflated flowers.

E. cinerea is the most useful of the summer-flowering group. It is found wild throughout this country, and known by the common names of Scotch or Grey Heath. It usually grows from 6ins. to 9ins. in height, though it sometimes attains a height of 15ins. or more. It soon spreads into a large mass and blooms profusely, the flowers being in upright racemes and reddish purple in colour. The seedlings vary considerably in colour, and several of them have been named accordingly, as *alba*, *coccinea*, *purpurea* and *rosea*.

E. darleyensis may be more familiar as *E. mediterranea hybrida*, but as it is a hybrid between *E. carnea* and *E. mediterranea*, it cannot very well be retained as a variety of one species. Growing from 12ins. to 18ins. high, it is of dense, spreading habit, and enjoys a remarkably long flowering period, for the blooms begin to open in November and are scarcely over by mid-May. The flowers are reddish in colour and the plant is perfectly hardy.

E. lusitanica, a species from south-west Europe forms a symmetrical tree 10ft. or 12ft. high, with plumose branches and bright green leaves, among which the cylindrical flowers, pink in bud and white when expanded, appear during spring. In mild winters some flowers are to be found from December onwards, but the best time is from February to late April.

E. Mackayi is a curious plant with affinities to *E. Tetralix*, some people considering it to be a hybrid of which *E. Tetralix* is one parent. It has, however, been found wild in more than one country. Of rather loose habit, it grows from 6ins. to 12ins. high, and bears its reddish flowers from the points of the shoots. The variety *flore pleno* has double flowers.

E. mediterranea is a large bush from Spain and the south of France which may grow to a height of 10ft., but is often less than half that height. Its red flowers are borne freely from early March to May. The variety *alba* has white flowers, *hibernica* has glaucous leaves and is found wild in Ireland, and *nana* is of dwarf habit. The Mediterranean Heath makes a very graceful bush, and needs little pruning. W. D.

(To be continued.)

THE SMALL OR SCALY-LEAVED EVER-GREEN RHODODENDRONS

This title may very well be given to a distinct group of Rhododendrons introduced from China within the last three to four decades. The flowers of some, in size and appearance, suggest Azaleas; though, unfortunately, they lack the powerful fragrance which is a delightful character of many Azaleas.

THE first of the Chinese Rhododendrons to reach our gardens during the period under review were *RR. racemosum*, *rubiginosum* and *yunnanense*. Seeds of these were sent to the Jardin des Plantes by the Abbé Delavay in 1889. Other collectors have since that date sent home seeds of these

France, as plants raised at Les Barres flowered in 1904. Most of our plants, however, are from seeds collected by Mr. E. H. Wilson during 1908 and 1910. *R. Augustinii* forms a much branched shapely bush, 4ft. to 6ft. or 8ft. high; eventually, we are told, up to 10ft. high. A line of hair along the mid-rib beneath the leaves is a character which

THE SOFT YELLOW RHODODENDRON LUTESCENS.

three and numerous other species of somewhat similar habit. As garden plants this group possesses several valuable characters. They are free in growth, produce quantities of blossoms, and are readily propagated by seeds, cuttings and layers.

It is easy to find positions for the plants in the garden, the spots to avoid being dense shade on the one hand and a dry, hot sunny exposure on the other. As lawn specimens or in beds, in the shrubbery border or in open woodland, these Rhododendrons are very effective, and in many instances young plants commence to blossom from seeds when only two to four years old. It is very noticeable when raising seedlings of these Rhododendrons, either from imported or home-saved seeds, how much the blossoms vary in size and colour. By careful selection it should be possible to produce a race of valuable evergreen flowering shrubs of great beauty.

The first I propose to mention is *R. AUGUSTINII* because, though not the first, it is certainly one of the most distinct and valuable introductions. It is a common Rhododendron in Hupeh and Szechuen. Professor Augustine Henry, in compliment to whom the species is named, collected specimens in Hupeh; Père Farges was apparently the first collector to send home seeds from Szechuen to

readily distinguishes this species when not in flower. The blossoms are borne in clusters of three to six or eight at the end of the shoots. They vary in colour from almost white to mauve, lilac and purple, the most desirable of all being the one with "blue" flowers, or at least most nearly approaching that colour at present of any Rhododendron. The colour figured in the *Boissacal Magazine*, tab. 8497 (lilac-mauve), with 2in. wide blossoms is also a desirable form. The flowering season is usually April, but this year there were many open flowers on the bushes the last week in March.

Another species which has variable flowers is *R. RUBIGINOSUM*, the colour varying from pale to rosy lilac, more or less spotted with maroon. Abbé Delavay sent home the first seeds from Yunnan in 1889, and we have also plants raised from seeds collected by Mr. E. H. Wilson and Mr. G. Forrest. *R. rubiginosum* forms a compact bush, invariably covered with blossoms each year during April. The best group of plants at Kew is well sheltered on the east side by thick planting, which affords a very desirable protection from spring frosts. The plants are now 4ft. to 5ft. high and about the same in diameter.

R. YUNNANENSE flowers at the end of April and during May. A bush in the Rhododendron Dell at Kew raised from seeds sent to the Jardin des

Plantes, Paris by the Abbe Delavay in 1880, is now 8 ft. high and rott. through. The flowers are bluish white, more or less spotted and blotched with brownish crimson on the upper side. Subsequent importations of seeds have introduced many plants of this species with inferior blossoms, which must be discarded in favour of the forms with flowers 2 ins. across, and richly blotched, which open in May.

The first species to flower, and one of the most profuse in the production of blossoms is *R. LUTESCENS*. Except in colour, which is yellow, we were not impressed at first by this species, because the flowers and early growths were usually damaged by frost. Later introductions, however, appear to be harder, and are certainly much freer to flower. There have been plants in flower at Kew for two months, from February to April. During that time at least three frosts ruined the

blossoms, but there were others still unexpanded which soon made good the damage. Sprays of this species are useful to cut for vases. I recently saw this and *R. Augustinii* (pale yellow and "blue") most effectively associated in Cornwall.

Another species with pale yellow blossoms, but which opens during April and May is *R. AMBIGUUM*. This was first introduced by Mr. Wilson in 1904 from Western China. It will doubtless not appeal to everyone, but among the seedlings of this species are plants with purplish shading, apparently natural hybrids of *R. conium*, a species it closely resembles, except in the colour of the flowers. Shapely bushes 4 ft. or 5 ft. high are distinctly attractive in a shrubbery border.

Another scaly-leaved species introduced by Mr. Wilson during his fruitful expedition of 1901 was *R. YANTHINUM* (syn. *Benthianum*). This has

purple flowers, some a pale colour, which should be discarded in favour of those with rich glowing red-purple blossoms, which are very distinct and pleasing on bushes 3 ft. to 5 ft. high. Ultimately, no doubt, this species will grow taller. The true *R. LONGISTYLUM* is a desirable white-flowered bush, which has, unfortunately, been confused with *R. micranthum*, seeds and plants of this species being often grown for the first named. With its larger leaves and blossoms and earlier flowering there need be no confusion among living plants.

R. DAVIDSONIANUM might at first be mistaken for *R. yunnanense*, but it flowers three weeks to a month earlier, and the underside of the leaves is very thickly dotted with dark scales.

There are other species of more recent introduction, but as they are not readily procurable from the trade descriptive notes would be of little value. A. O.

PRIMULA CORTUSOIDES AND ITS ALLIES

ALTHOUGH consisting of less than a dozen species, the section "*Cortusoides*" contains several ornamental plants of excellent garden value. They are natives of Northern Asia, China and Japan, with a closely allied species, *P. geraniifolia*, in the Himalayas. Speaking generally they are shade-loving plants, nearly all flourishing in shady or half-shady positions. They enjoy a rich loamy soil with plenty of humus, thoroughly well drained, especially in winter, when stagnant moisture is fatal to their well-being. Easy to propagate, as the plants make several crowns, these may be divided while they are at rest, and either potted up singly or planted out in the place where they are to flower. Seeds also are produced freely by most and are readily raised if sown in a little heat in spring. The seedlings, as soon as they are large enough to handle, should be pricked

off into pans in a compost of sandy loam and leaf-soil and grown on in a shady frame till they are large enough to plant out. Some of the members of this group, like *P. cortusoides* from Siberia, have been in cultivation in this country for a long period; others, like *P. Veitchii*, have been introduced comparatively recently from Western China.

P. CORTUSOIDES.—The true plant, although said to have been introduced into cultivation in 1794, is rare in gardens, other species like *P. saxatilis* doing duty for it. It is a native of Western Siberia, from the Urals to the Altai mountains and is readily distinguished by the very short pedicels, although similar in all other respects to *P. saxatilis*, which has very long pedicels. The leaves are large, softly hairy, cordate, lobed and wrinkled, on stalks 3 ins. to 4 ins. long. The flowers are deep rose coloured, borne in umbels on scapes 6 ins. to

8 ins. long in May. *P. cortusoides* var. *amurensis* is a synonym of *P. Sieboldii*.

P. GERANIIFOLIA.—The geranium-leaved *Primula* is a native of the Himalayas and was introduced into cultivation in 1887. It has spreading leaves, orbicular in shape and deeply cordate, hairy on both surfaces. The pale purple flowers are borne in a terminal umbel, with sometimes a whorl below the umbel, on scapes 6 ins. to 10 ins. high. It is a pretty little plant which flowers in May and requires rather more shade than the others of this group.

P. BEUCHERIFOLIA (syn. *P. Gagnepainii*).—This is a very distinct species, with orbicular, seven-lobed leaves, the lobes being again coarsely toothed and lobed. The leaves are about 3 ins. in diameter, thin in texture and borne on hairy petioles 3 ins. to 4 ins. long. The flower scapes rise to a height of 6 ins. and bear an umbel of violet-purple flowers

ONE OF THE BEST OF THIS SECTION, PRIMULA LICHANGENSIS.

A GOOD FORM OF PRIMULA SIEBOLDII.

in May. The flowers vary in colour, some being pale with a lighter eye, while others are dark purple with a darker zone near the mouth of the tube. Seeds of it were sent home from Western China by Mr. E. H. Wilson and it flowered in 1910.

P. KAUFMANNIANA.—A rare species in cultivation, this plant is a native of Turkestan, from

from Japan in 1865, of which there are many beautiful, large-flowered varieties. The type is distinguished from *P. cortusoides* and *P. saxatilis* by the very large calyx lobes, which suggested the name *patens*, one of its synonyms. The wild plant is found in Japan, as well as in North-eastern Asia and has a creeping rootstock. It has leaves like *P. cortusoides* with deep rose-coloured flowers in

THE SUN-LOVING PRIMULA VEITCHII.

whence it came in 1883. The leaves are orbicular and lobed, with a cordate base, softly hairy and borne on a long stalk. From 6ins. to 12ins. high, the flower stems bear one or two whorls of rich violet flowers in early summer.

P. LICHANGENSIS.—This is one of Mr. Forrest's introductions from Western China, when collecting for Bees, Limited. It is an ornamental plant with tufts of broadly ovate-cordate leaves, irregularly lobed, on long hairy petioles. The leaves are also hairy, especially on the under side. The large rose-red fragrant flowers are borne in umbels on hairy stems up to a foot in height and have brown calyces. Forrest says it grows in shady situations on steep, rocky slopes and ledges of limestone cliffs on the eastern flank of the Lichiang range. It flowers in May. It is distinguished from *P. heucherifolia* by the calyx, having a gibbous base instead of a tapering one.

P. SEPTEMLoba.—This is another of Forrest's finds in North-western Yunnan, where, in its native home, the plant favours shady and somewhat damp situations, at an altitude of about 10,000ft., in the forest and scrub clothing the side valleys of the Szechuen range. It is a graceful plant with slender flower scapes surrounded by clusters of bright green leaves on slender stalks. These leaves are orbicular in outline with, as the specific name indicates, seven distinct blunt denticulate lobes. Both the upper and under surfaces are covered with soft hairs, as well as the petiole. The flower scapes grow up to 1ft. high and bear umbels of small, reddish-purple, pendulous flowers in May. It closely resembles the Himalayan *P. geraniifolia*.

P. SIEBOLDII (syns. *P. patens*, *P. cortusoides* var. *amœna*), is a well known garden plant, introduced

April and May. The garden varieties bear flowers of larger size, and of colours varying from pure white to deep crimson and almost purple. Some of them have the corolla inside pink or white, and outside crimson or pale mauve. Although generally grown as a pot plant for the greenhouse, it is hardy in suitable sheltered situations.

P. SAXATILIS.—This plant has long been grown in gardens under the name of *P. cortusoides*, to which it is very closely allied. While the latter is found in Western Siberia, *P. saxatilis* is distributed over Eastern Asia, through Amurland, as far as Korea. It is an ornamental and very hardy plant, growing about 1ft. in height, with thin, hairy, lobed, ovate leaves and umbels of rosy purple flowers in April. As mentioned under *P. cortusoides* it is distinguished from that species only by the very long pedicels of the umbel.

P. VEITCHII.—A handsome plant which has proved quite hardy, this is one of Wilson's introductions from Western China, where it occurs at elevations of from 8,000ft. to 10,000ft. It is usually found on cliffs and dry banks and approaches the well known *P. cortusoides* in habit, but is a finer and more robust species. The leaves have a dark green, corrugated, slightly pubescent upper surface, and the underside is covered with a dense white tomentum. This at once distinguishes it from the others in this group. The flowers, produced in an umbel of from ten to twenty blooms, terminating a scape 12ins. to 14ins. high, are about an inch in diameter, of good form, deep rose-coloured, with an orange ring surrounding the yellow mouth of the tube. It received an award of merit when first exhibited by Messrs. Veitch and Sons at a meeting of the Royal Horticultural Society in May, 1905.

PANSIES AND VIOLAS

Failure from spring planting and its causes.

AT this season of the year a tremendous number of Pansies and Violas are purchased and planted and, judging by the frequency with which the remark is heard that "the flowers never retain the size and quality they had when first planted," a large proportion bring disappointment to their purchasers. Much of that disappointment might easily be avoided if a little forethought and consideration were devoted to what I will term "the reasons why."

To begin with the plant as purchased: it is, of course, grown with the set purpose of making it as attractive and saleable as possible. The commercial grower knows the benefits of a soil that is rich in humus, and also knows just when and how to apply a "last minute" stimulant to the plants so that the opening buds may receive a fillip that will develop their utmost size. If the plants thus treated were left undisturbed there would be no difficulty in maintaining their high standard; but, instead of that, the plants are lifted with fork or trowel and the tips of nearly all their roots are broken in the process. It is, of course, the tips that are the mouths of the roots by which the plant absorbs nourishment from the soil, and, consequently, just at the time when the maximum of nourishment is required for the development of blossoms, we rob the plant of its means of absorption from the soil. It follows that, in an effort to develop and support its blossoms, the plant exhausts the nourishment already stored in its cell reservoirs, and that is a process which, inevitably and rapidly, saps the vitality of the plant and renders it incapable of producing anything but inferior blossoms.

Despite these remarks it would be by no means correct to say that Pansies and Violas cannot be successfully transplanted after they have commenced to bloom, for if given a reasonable chance they are capable of very readily producing a fresh set of young roots, and then can go ahead little or none the worse for their shift.

That reasonable chance consists of first preparing a congenial rooting medium. The Pansy tribe delights in a soil that is rich in humus, and after a long and extensive experience in Pansy culture, during which I have experimented with a vast number of substances for soil improvement, I am constrained to say that Wakeley's Hop Manure is as reliable, safe and wholly efficient as any conveniently obtained article for the purpose of preparing a good rooting medium for Pansies and Violas. Dig the hop manure into the bed, mixing with the soil as thoroughly as possible. It is not the best plan to throw the manure into the trench by the shovelful and just cover it up, but it should be spread evenly over the surface and then forked in so that every particle of the bed is evenly permeated and the roots can quickly gain access to some without coming into contact with a solid mass.

The next thing is to pick off all open flowers and the largest buds from the plants, thus reducing to a minimum the drain of blossoms upon the nourishment until the roots have taken hold of the fresh soil. It will be only about ten days or a fortnight before the new root system is in full activity, and henceforward the plants will be quite capable of producing blossoms of first-rate quality. To prolong the period of full vigour and bloom all faded blossoms should be picked off before they have developed seeds, and after the first month a little chemical fertiliser may be sprinkled on the soil around the plants and hoed

m. We shall now find an additional advantage of the presence of the hop manure. If soil is deficient in humus, the chemicals in the fertiliser which will be dissolved by the first thunderstorm or heavy shower will be washed right through the top spit into the subsoil below. The hop manure, being of a spongy nature, absorbs a great deal of moisture and with it the dissolved chemicals, therefore the latter are held within easy access of the roots to be drawn upon as required.

There is still another point in regard to Pansies and Violas purchased at this season. Before the plants are lifted for sale the beds are saturated with water so that they may be lifted with soil adhering to the roots. This soil is pressed into firm "balls," but the plants may be several days before they are again planted, and in the meantime the ball has dried into a hard-surfaced lump. If this hard ball is buried in the earth it will remain a hard lump for an indefinite period, and the roots are imprisoned. The correct thing is to soak the ball before planting, and if it has become very compressed it should be gently squeezed until its outer casing is cracked. The roots will then have an easy means of outlet to the soil of the bed in which they are planted, and the plant will be maintained in health and vigour. When, as frequently happens from mid-summer onwards, an old stem becomes swollen, discoloured and partially bare of foliage, cut it right out to the ground level. New young growths from the base will thus be encouraged, the earlier ones to prolong the flowering season, the later ones

IN THE WOODLAND WILD AT HALLINGBURY PLACE.

to provide excellent cuttings that may be rooted during autumn to provide healthy young plants for next year.
A. J. MACSELE.

THE POLYANTHUS

THE spring garden would be rather a tame affair were it not for the Wall-flower, the Forget-me-not, the Primrose and its cousin the Polyanthus. Of the last two, most flower-lovers consider the former the more chaste, but there is no unanimity on the point. The Polyanthus is unquestionably the showier plant of the two.

The culture of the two plants is very similar and both are apt to deteriorate rapidly when

propagated vegetatively. A cool site with shade from the mid-day sun really suits them best, and marly soils are preferable to light ones, but if treated practically as biennials and grown to maturity in shelter, they will flower excellently in the open garden. These plants soon shew the effects of drought and heat, but will quickly recover when conditions improve, if not infested with red spider, which will almost always be found the case. Unless a specially fine form is

retained and propagated for seed purposes, it is better to discard all plants which have been bedded in sunlight after their first flowering. In shady positions they may well remain at least one other season.

If, when lifted for transplanting, at any stage of growth, a close inspection reveals the presence of the dreaded red spider, the plants should be completely immersed for a few minutes in a solution of good quality soft soap and water (2oz. to the gallon), or in a soft soap and paraffin emulsion solution of proportionate strength. If the soap is properly refined and the paraffin perfectly emulsified, neither will damage the plants at all.

Soils for Polyanthuses should be deeply worked and not deficient in phosphates or lime. Potash and nitrogen are also essentials, but may easily be overdone if quality rather than mere size is looked for. Floppy, out-of-character flowers are perhaps more readily produced on light soils than on those of heavier texture, but over-feeding will produce them readily enough in any soil. A deeply worked soil of moderate richness and shade from the south

or natural shade, so much the better—will produce results incomparably better than those given by a shallower soil chock-a-block with natural and artificial manures. Planting in the semi-woodland wild such as is seen in the illustration of Hallingbury Place is, of course, ideal where such a situation exists, since it not only suits the plants, but the setting greatly enhances their beauty. Many Primulas, besides the Polyanthus and the Primrose, are impatient of direct sun-heat and shortage of moisture. Those of the Candelabra section, for instance, are almost all bog plants by choice, but boggy conditions do not suit the Primrose or the Oxlip which, in nature, are often found growing on shady but very dry-looking hedge banks. The Polyanthus is, if possible, less of a bog plant than the Oxlip, and, planted out in autumn and, if necessary, thoroughly watered in, is very unlikely to suffer from drought until flowering is over the following spring. The lower illustration shews the splendid strain of this flower grown at Spetchley Park, Worcester. The wonderful Spetchley strain of Primroses, worked up by the late Mrs. R. V. Berkeley, will be familiar to many readers from the exhibits at Vincent Square.

A VERY FINE STRAIN OF POLYANTHUS AT SPETCHLEY PARK, WORCESTER.

THE LONDON DAFFODIL SHOW

FOLLOWING as it did so closely upon the customary fortnightly meeting, the Daffodil Show of the Royal Horticultural Society at Vincent Square on April 13 and 14 attracted more visitors than might have been expected.

The first impression on entering the hall was one of disappointment, for the first thing that caught the eye was Douglas's Auriculas. These excellent varieties, superbly grown as they were, had already been seen and admired on the previous days. It was Daffodils, particularly new Daffodils, that most of the visitors went to see, and although these occupied another and a more prominent position, Douglas's Auriculas were still Auriculas. Besides these there were several other general exhibits left over from the fortnightly show, so that the hall was filled with flowers.

The great trade collections of Daffodils, naturally, occupied the same positions as on Tuesday and Wednesday, but the exhibitors took advantage of the opportunity to display fresh varieties. Messrs. Barr and Sons added yet another gold medal to their large collection of the coveted award, and they included several vases of magnificent blooms of what one may well term the New Barrii Narcissi. Their distinguishing character is a decidedly larger, and often flattened, crown of startlingly vivid colouring which stands out in marked contrast to the perianth, which is more substantial and rounder than in the older Barrii varieties. At present these new sorts are, of course, expensive, but we confidently predict that in the not far distant future, when they can be sold at "competitive prices," these will be considered indispensable by all garden lovers. Of this gorgeous type Scarlet Cockade, with a large cupped corona, and Prince Fushimi, which has a beautifully frilled corona in which the yellow colour becomes merged into a broad orange margin, are delightful illustrations. Golden Apricot is also a most beautiful flower, and its frilled cup becomes a lemon orange tint towards the margin.

Messrs. Sutton and Sons removed their centre of coloured Freezias, and while these had been very interesting, the group was left more decorative than before. For the special Show the centre was filled with such beautiful sorts as Firetail, Cræsus, Kestrel and Will Scarlett. Several very good seedlings were included in the centre, as well as elsewhere. Mr. J. L. Richardson had a splendid collection of first-rate varieties, which included, in Marquis of Headford, a most desirable white Trumpet Daffodil. Great Warley, a double primrose-coloured variety, and some most promising seedlings of various types were also prominent.

The fresh varieties placed in the Donard Nursery Company's collection also included good seedlings. Market Glory, yellow perianth and large orange cup; Festive, a paler perianth, with a bright orange yellow corona; and the Chaste White Star are the names of only a few of the desirable sorts they set up so well. The value of some of the new sorts for massing was well illustrated by Mr. W. A. Watts, who tastefully arranged large baskets of Owen and Xenophon, a twin-flowered Poetaz with blooms almost as large as the Barrii varieties. Xerxes, a similar bright orange-cupped variety, is more formal, and so is recommended as a show flower. Nannie Ellicoat is very lovely with its rich salmon trumpet, which becomes yellow at the base. Jingle may well be termed a Will Scarlett Poeticus variety.

Messrs. J. R. Pearson and Sons added many excellent blooms to their attractive collection of Daffodils from home-grown bulbs, and these

included Beersheba, a very fascinating pure white trumpet of perfect shape and a paper white perianth, which was awarded a Preliminary Commendation.

THE OPEN COMPETITIVE CLASSES.

The best large Trumpet Daffodils were shewn by Mr. J. L. Richardson, who had twelve splendid vases. He included his new Miss Helen O'Hara, Lord Roberts, White Knight, Herod and some excellent seedlings. Dr. Lower, who was second, shewed mostly his very good seedlings. In the class for twelve Incomparabilis varieties Mr.

blooms of such as Raelurn and Valetta, with many of his excellent seedlings.

The first prize six self-coloured yellow Trumpet Daffodils were gloriously coloured, and Mr. W. B. Cranfield fully deserved his first prize. Seldom has such rich golden colour been seen as on his blooms of such sorts as Grenadier and Betty. Mr. Chapman was second with paler blooms, and in Cinema he has an especially large Trumpet Daffodil.

The six white Daffodils staged by Mr. Richardson were magnificent, and his first prize set included Miss Helen O'Hara. The best six bicolors by the

Rev. T. Buncombe were also of high quality, and he included Torrington, Pugilist and Beara. Mr. W. B. Cranfield, who was second, had a vase of immense blooms of Cranfield. In his first prize exhibits of six varieties of yellow and of bicolor Incomparabilis Dr. N. G. Lower had three especially beautiful seedlings, and Mr. Richardson, who came second in each instance, also shewed seedlings of great merit. Dr. Lower was also first with six yellow Barrii varieties, his vase of Crucible, which has a very broad fiery orange corona, was superb. In Devon, which has a large, flattish, pale yellow corona and a paler perianth, the Rev. T. Buncombe, who was second, has a most charming flower. There was no first prize set of bicolor Barrii blooms, but the large-cupped Leedsii blooms by Mr. J. L. Richardson were of great merit. They were mostly unnamed seedlings; but one that is named Lady Millicent Taylour is wonderfully beautiful. It has a widely expanded corona of pinkish buff colour. The best small-cupped Leedsii were

THE HANDSOME WHITE TRUMPET VARIETY BEERSHEBA.

W. A. Watts was pre-eminent with beautiful flowers of such as Peggy, Juniper and Stormer; while Mr. J. L. Richardson had to be content with second place, though his dozen included unusually good blooms of Lady Moore, The President and Great Warley.

In the Barrii class the judges found it impossible to discriminate between Mr. J. L. Richardson and Mr. F. H. Chapman, so they placed them equal first. Both included many seedlings with vivid coronas, and also a vase of Firetail. Mr. Watts was third.

The new section for small Leedsii Daffodils (*i.e.*, those which have the cup or crown less than one-third the length of the perianth segments) was not contested, and in the class for the larger section the competition was poor. Poeticus were few in numbers but of high quality, and Mr. Chapman was awarded the first prize for splendid

shewn by Mr. F. H. Chapman. Mr. W. B. Cranfield had six dainty and charming Cyclamineus varieties. White Coral, which has a serrated margin, is an example. Mr. W. F. M. Copeland was decidedly first in the class for six double Daffodils, and the very best were Silver Rose, Petronia and Orange Doubloon.

The Engleheart Cup, which this year was offered for the best twelve varieties not in commerce was won by Dr. Lower, who shewed mostly seedlings of great merit; while Delhi, an Incomparabilis with a large orange-shaded corona; Crucible, a Poeticus; and the new Beauty of Radnor were well worthy of note. Mr. W. A. Watts was a good second, and his outstanding blooms were Enid Dorothea, which has a large, crinkled, orange cup; Gladys Bibby, a chaste Leedsii with a pale lemon cup; and Jorrocks, a Barrii with yellow perianth and a small deep orange cup. The best

of the six new varieties with which Mr. Richardson won the first prize were seedlings; while Mr. Copeland, who was the most successful in the class for three varieties not in commerce, included Inez, a large self yellow *Incomparabilis*.

Dr. Lower, showing unnamed seedlings, won the gold medal offered for the best twelve varieties raised by the exhibitor.

In the class for six similar varieties Mr. P. D. Williams was first, and in Picador he had the most shapely *Poeticus* bloom in the Show. The class for three varieties raised by the exhibitor was very popular, but it did not contain any epoch-making blooms. Sir C. H. Cave was first. The novice class, open only to those who have never won a first prize for seedling Daffodils, was also very popular, and here Miss Hinchcliffe, who included Helga, a Leedsii with a white perianth and a large, widely expanded cup, had the best three seedlings.

There were many interesting blooms in the various classes for one bloom each of the different types, and in the annexe there were competitive exhibits illustrating methods of packing the best Daffodils in boxes for transmission to the markets.

In the amateurs' classes Mr. H. R. Darlington won the silver Flora medal with a noteworthy "collection of twenty-

four varieties representing the different divisions," and Miss Hinchcliffe was a very good second. Mr. Darlington also had the best six varieties of Trumpet Daffodils, of Tazetta and of double Daffodils.

Major G. Churcher, showing magnificent blooms of such as Prince Fushimi, Discus and Pedestal, won the silver Flora medal with the best twelve varieties.

In the open amateurs' section Mr. W. B. Cranfield had a particularly good collection of thirty-six varieties representing the various sections. Will Scarlett, Firetail and Dorosis of the Barrii, and The Doctor, King Alfred and Monarch of the Trumpets being equal to any others in the Show.

NEW DAFFODILS

Beauty of Radnor.—A chaste *Incomparabilis* variety which has a pure white perianth surrounding a lemon-coloured corona which is lightly margined with pale orange. Award of merit to Dr. N. G. Lower.

Dainty Maid.—A charming flower which may well be described as a *Poet's Narcissus* with a delightful lemon-coloured corona which has a buff-orange rim. Award of merit to Mr. W. A. Watts.

Dulcimer.—This should prove to be a very valuable *Poet's Narcissus* for all purposes. The stems are exceptionally long and stiff. The shapely milk-white flowers are borne at right angles, and they have dainty little scarlet-rimmed coronas. Award of merit to Captain Hawker.

Dinton Red.—The large milk-white flowers are well disposed on stout stems, and the flattish coronas are fiery orange in colour. Award of merit to the Rev. G. H. Engleheart.

Miss Helen O'Hara.—This splendid white Trumpet Daffodil was to be seen in several first prize exhibits. It ranks among the largest of

THE SPLENDID WHITE SHOW DAFFODIL MISS HELEN O'HARA.

its type, and has an unusually long, cylindrical tube which is gracefully rolled back at the mouth. Award of merit to Mr. J. L. Richardson.

Owen.—A graceful *Barrii Narcissus* which has a primrose yellow perianth and a warm orange corona which pales in colour towards the centre, merging into a greenish tinge in the middle of the flower. The great decorative value of this variety was evident in the generous masses of bloom, which supported the exhibitor's statement that it was exceptionally free flowering. Award of merit to Mr. W. A. Watts.

Red Guard.—A very uncommon *Barrii* variety of good form and star-like shape. The perianth is a pale buff orange in colouring, and the corona is a rich fiery orange. Award of merit to Messrs. R. H. Bath, Limited.

Red Rim.—A large *Poet's Narcissus* with a broad flattish yellow corona with a distinct red margin. Award of merit to Rev. G. H. Engleheart.

Wide Wing.—This might almost be termed a picotee-edged *Poet's Narcissus*, for the pale yellow corona has a distinct line of orange-scarlet around it. The large, shapely perianth is not so dazzling white as in the other novelties from the same source. Award of merit to the Rev. G. H. Engleheart.

FORTHCOMING EVENTS

May 1.—Cornwall Daffodil and Spring Flower Society's Show.—Royal Caledonian Horticultural Society's Meeting.

May 5.—Blackburn and District Horticultural Society's Meeting.

DAFFODIL NOTES

I AM wondering to-day (April 12th) what the Show in London will be like, and if, after an enforced absence of two years I shall see any advance at Birmingham next week. The season being on the early side, I fear there will not be as much at the last-named show as there would have been had things been normal. Two days ago I had a few lines from Mr. E. T. England of Exeter who said that to his great regret he was "over" for London and, of course, would have nothing for Birmingham. It was very disappointing, as his seed beds had given him some very good flowers. I saw those very same beds last year on the Saturday before Easter Day (April 15th), when there was practically "nothing doing." My own Daffodils have almost all gone down the eelworms' throats. Lady Moore is among the lucky ones that have escaped. Few varieties are more pleasing when grown in pots and given cool house treatment. The well defined broad red rim to the large yellow cup gives a note of distinction to the neatly shaped bloom. I find the bulbs seem to like a season in pots, for if they are well looked after when they have done blooming, and carefully dried off, they produce—even quite small bits—the next year when planted outside, excellent flowers; although, as might be expected, they are on the small side. I have, too, a few healthy looking buds of Firetail, which will open in two or three days. If only those delightful red cups and eyes did not burn in sunlight! One never knows what is in the lap of the gods, but this splendid variety bids fair to become one of the most popular of Daffodils. A lady friend of mine who was at one of the March shows of the R.H.S. thus wrote in the report of her visit: "I saw a real beauty named Firetail." It was the only variety she mentioned by name. I have been told by those who have grown it longer than I have that it does not burn quite so readily as most "red eyes."

Thanks to some good friends, Mr. P. D. Williams, Mr. P. R. Barr, Mr. Watts, Mr. Savery and Lady Philipps, I have been able to feast my eyes upon a few more than those wretched eelworms have left undevoured of my own. To single out a few, from Mr. Williams came a beautiful giant Leedsii of the very first water. From Mr. Barr I had Watteau, a new 1922 introduction with an ivory white, not-too-formal perianth and a well proportioned trumpet tinted with a delicate and unmistakable tinge of pink, and also Casimir, which is a variety of outstanding merit to grow in pots or to cut for house decoration. To myself I would describe it as a sort of glorified bicolor Frank Miles, but I fear so many of our old favourites are now back numbers like, say, George Vance, the dunce's-cap-shaped sugar loaves in grocers' windows and the giant decanters filled with coloured water in the chemists', that I had better say it has a yellow cup with pure white perianth segments—long pointed and graceful. Those old favourites were brought to my notice in early April by some blooms which came from Lady Philipps of Cosherton Hall, near Penbroke, with a request to name them. I did my best and I hope the majority of my names were correct, but one forgets when one has not seen them for years, although they were once all in all to us Daffodil enthusiasts. They came from the grass. It is to the grass we must go if we wish to renew our acquaintance with the flowers of other days. I could pick many in our churchyard here—Vanessa, John Bain, Maurice Vilmorin, Burlidgei, Crown Prince, Princess of Wales, Orphee and Ellen Barr. They must be but mere names to many and yet they were all staged in the big "fifty" class at the Midland Show at Birmingham in 1900.

From Mr. Savery of Silverton, near Exeter, I have had two most interesting boxes of his home-raised seedlings. He is unable to get to shows on account of his health and he sent them to me for an opinion. "It's an ill wind that blows no one any good," hence Mr. Savery's misfortune has been my gain. The second batch was especially interesting. To begin with I have never had such a whiff of spicy perfume from such a small box of Daffodils as that which came from this one. The letter of explanation that travelled with them told the secret. The blooms were all hybrids between Bernardino and Jonquilla simplex. Each one had a good scent. Two varieties were yellow selfs; the other four might have been small Leedsis, but the smoothness and rich texture of their perianths betokened an unusual origin. Mr. E. T. England visited Mr. Savery last year and expressed the opinion that the "colours were something quite new in Jonquil hybrids." I think I have seen pale hybrids, but they are very unusual. St. Asaph bids fair to become famous for something else besides her Archbishop. The Welsh Bulb Fields which immediately adjoin the railway station are taking a new lease of life now Mr. Watts has given up all his military duties and once more settled down into civil life. The Clwyd Valley which runs up from St. Asaph to Denbigh seems to be one of those spots which lend themselves to the growing of bulbs for commercial purposes. I do want all my fellow countrymen to encourage as much as they can the home production of Daffodils and Tulips. It does me good to

read in R. H. Bath's preliminary list that the firm has 60 acres of land under bulb cultivation and that they can say "We believe that we are the only firm in England growing the bulk of the bulbs offered in our catalogue." I wish more firms could say the same. I fancy Mr. Watts' firm will not be long before they can. Nothing impressed me more when I opened the large box of flowers that he sent me this April than the strength and vigour of the stems. Even Mr. Duncan Pearson would give them a "very good" mark, I am sure, and he is a hard judge in this matter. Some of the varieties were Mr. Watts' own raising and some were not. Of those which I think were his, none pleased me more than Melyn, a yellow-cupped Lord Kitchener, from a show point of view; and Phyllis Vansittart, from a decorative standpoint. It has beautifully smooth perianth segments and a rather long, narrow pale yellow trumpet. It lasted a long time in water and was strongly scented in the warmth of my study. The large, loosely-built, all-yellow Derwin was very attractive and if its constitution is all right it might even take the place of Frank Miles as a variety for cutting. Colwyn, a small Leedsii, another home-raised flower, is very nice, but it is not quite so graceful as Countess of Southesk.

JOSEPH JACOB.

Orchids. I would be grateful, too, for any hints of how best to naturalise Mosses.—L. a. D. GUTHRIE-SMITH, Killearn, Stirlingshire.

HYBRID GERBERAS.

HAVING drawn attention in an article on page 171 in the issue of April 7 to the colours that should be sought in Hybrid Gerberas—the colours having come into question—I should be glad if I may further remark upon form and size, because upon these features much of the beauty must depend. This is all the more necessary since at Cambridge a number of hybrids partaking too strongly of *G. viridifolia* were allowed to exist, and may still be seen no doubt. These have the ray petals much too short and much too straight, resulting in a stiff-looking flower-head. A flower-head may be very beautiful and too much should not be expected from a plant that is quite small, but to pass all criticism the size must at least be that of a good *G. Jamesoni*, and it can even be more graceful by the curving and length of the

CORRESPONDENCE

NOTES ON BULBS.

I HAVE read with much interest in the issue of THE GARDEN for April 14 Mr. Jacob's "Notes on Bulbs," and I much regret I did not meet him on Thursday at the R.H.S. Daffodil Show. I am sorry he is not successful with King Alfred. Here in South Devon I can assure him it thrives, and this year it has done better than usual. I have had stems of quite 18 ins. to 20 ins., and of course in colour and form it is far superior to Emperor. Now as to *Narcissus triandrus albus* and the triandrus hybrids, I find the former increases with me in grass by self-sown plants, and does not die out, unlike *N. t. calathinus*, which I cannot keep except by growing on from seed. I have a good number of triandrus hybrids grown in grass. They were given me nine or ten years ago by Mr. Engleheart, and seem to do quite well. They are charming as cut flowers. Cyclamineus also does well with me in grass and increases slowly.—H. G. HAWKER.

MAY-FLOWERING TULIP LA MERVEILLE

THIS is a splendid Tulip when it is good, but, unfortunately, with me it has a tendency to sport, and I should like to know the experience of other growers in regard to the behaviour of this variety. We grow a large number of May-flowering Tulips, but the bed of La Merveille for the last three years cannot be considered satisfactory, quite a large number of white Tulips putting in an appearance. If we grew any white Tulips I should feel inclined to think that they were mixed in some way at the time of lifting, but this is impossible. The first year they were fairly true, so I am wondering if this kind does sport or whether some small bulbs of other sorts were in the original stock which did not attain flowering size until a year or two later. Any information from readers would be appreciated.—CHEPSTOW.

A FINE LILIUM GIGANTEUM.

THE accompanying photograph, taken in the garden at Matai-Moona, New Plymouth, New Zealand, the residence of the late Mr. S. Percy Smith, F.R.G.S., illustrates a superb plant of this magnificent Lily. It attained the height of 12 ft. 8 ins., and bore nineteen fully developed flowers. The foliage was also exceptionally robust, large and perfectly developed. The climate of New Plymouth is very mild but humid, which conditions suit all species of the Lily Order. *Lilium auratum* and its splendid varieties attain to a height of 7 ft., and bear very large, perfect and richly coloured flowers. The plant of *L. giganteum* shewn in the illustration grew in a damp, narrow valley on the edge of a small area of native bush or forest.—W. W. SMITH, New Plymouth, N.Z.

SEEDS OF BRITISH WILD FLOWERS.

I AM interested in trying to naturalise the most beautiful of our British wild plants. I wonder if any of your readers could suggest where I could buy seeds or plants of any such, and also British

A WELL GROWN LILIUM GIGANTEUM.

ray-petals. This is shewn by Moon in his plate in Robinson's "Flora and Sylva," but the beauty of this group would be enhanced in the minds of many, I think, by a slight filling up of some of the spaces between the petals. Many of the flower-heads certainly do shew this regularity, which, however, is by no means a rigid stiffness. I am confident that it would be quite possible to fix the best colours and forms and to raise each

one true from seed, but, unfortunately, seed is not produced in great quantity. There may be one flower-lead to a hundred of *Cineraria*, with seed in proportion, but the selection and choice are made by limitation of number. — R. IRWIN LYNCH, V.M.H.

THE "POTATO TREE."

I AM sending you a photograph of a Potato Tree, *Solanum crispum*, that grows on the gardener's cottage here. It is the most beautiful shade of mauve. — (Mrs.) D. BURNALL, *Creagh Castle, Co. Cork*

COLOUR HARMONY IN THE ROCK GARDEN.

I WAS glad to see the question of colour in the rock garden referred to in *THE GARDEN* of April 14, for the subject had been on my mind for some weeks past. If, as the writer of the article states, the average rock garden is deficient in greenery at this time of year, this defect is certainly far too frequently seen in those of the exhibition type. Some that I have seen of late at various shows appear to have been examples of the "bedded-out rock garden," where a superabundance of blossom in all possible colours shouts to claim our attention. This riot of colour would perhaps last a month, after which the garden would be but an unornamental botanical collection. Although, as the writer states, we usually strive to "ensure harmony in the herbaceous border by the liberal use of plants with grey foliage and inconspicuous blossom," I think he gives us a timely and needful reminder when he writes "in the rock garden we shall do much better to concentrate on plants which give repose now with their foliage and will provide us with blossom at another season." The mention of grey foliage reminds me of the French Artichoke (*Cynara Scolymus*), not seen in our flower gardens and herbaceous borders anything like so much as it deserves, with its graceful fern-like silvery leaves. I never saw it used with finer effect than I did a few days ago in the new gardens surrounding the Pavilion at Bognor. Here, in early April, the plants were already nearly 3 ft. in height and formed a beautiful centre for beds of pink and crimson Tulips. The laying out of this piece of ground reflects the greatest credit on Mr. Oswald A. Bridges, C.E., the town surveyor.

In the article referred to in *THE GARDEN* the difficulty of harmonising the so-called pink with the misnamed blue *Aubrietia* is mentioned. As they are semi-tones, they distract the eye in precisely the same way as semi-tones of sound distract the ear, and should be kept well apart. Magenta is a grand colour if used rightly, and is most pleasing with shades of orange or brown. How exquisite the yellow and orange shades of *Azalea* or *Berberis* appear when grown with *Rhododendrons*! How charming the *darwinium* and *croceum* Lilies look when grown near the Tyrian purple *Geranium ibericum*! The magenta and purple toned *Aubrietias* might well be associated with *Fritillaria Meleagris* and planted against a background of the purple-leaved Plum in its spring dress of bronze. *Berberis Darwinii* and the newer hybrids with their deep orange blossoms and the stately orange flowered

Crown Imperials would here find their right place. The soft apricot-coloured flowers of Sir Thomas Moore Tulips might be grown close to, or above, the *Aubrietia*. This orange tone might lead on to drifts of *Narcissi* such as *Gloria Mundi* and *Lucifer*, with its glowing cup. The purple-leaved and crimson-leaved Japanese Maples would look most beautiful among them. One has only to recall the flowers of the *Cattleya* to perceive how superb is the effect of mauve and magenta with

SOLANUM CRISPUM ON A COTTAGE.

citron and orange. It might be worth trying to associate a light rose-coloured *Aubrietia* with *Muscari azureus* or *Myosotis* when one remembers the turquoise feathers in the warm grey wing of the jay. The planting of some of the Alpine *Dianthus* would soften down the pink colour with their silver grey leaves if needful. *Muscari* or *Myosotis* associated with the old brown Wallflowers suggest the colouring in the wings of the tortoiseshell butterfly. But there is no colour more precious in the early spring than rose. One would love to see a border planted at the back with the deep rose double Peach between bronze-leaved *Prunus* and, well in front of them, *Cynara Scolymus* and *Dicentra spectabilis*, groups of the richer, rose coloured *Megasea*, and in front of all a little dip planted thickly with *Primula rosea*, while on higher ground the graceful crimson-flowered *Corydalis* would add grace and colour to the picture. — H. H. WARNER.

NEWTON WONDER AS A KEEPER.

I WONDER if many, or any, growers are troubled as I have been with Apple Newton Wonder. I found it, at the beginning of February, brown at the core and quite unsaleable, yet I see it recommended as fit for dessert and to keep good till May. It may be that the sunless, wet autumn affected our crop, as, apart from the wet weather, we have a wet garden. The soil is a heavy, retentive loam, and when the river is in flood we get water into the garden. Other varieties of Apples we grow are not affected in the same way

as Newton Wonder, and we have over sixty varieties. — L'ALLEGRO, *Culshie*.

[This is an interesting point, and we shall be glad to receive readers' views. Rotting at the core is a well known failing of Bismarck in this country, but we have never seen such a condition in Newton Wonder. — Ed.]

PRIMROSES AND POLYANTHUSES.

IT was with pleasure upon a delightful spring afternoon a few days ago that I visited the interesting gardens of Mr. Frank Neave, Lingwood, Norfolk. Beyond the confines of his own county Mr. Neave's reputation has spread as a specialist in Primroses and Polyanthuses. The individual pips of the trusses of flowers of his large strain make a five shilling piece look small, and are not coverable by an ordinary-sized watch. The object of my quest was to see the great strides Mr. Neave is making with blue Polyanthuses. I well remember his first step from a Wilson blue Primrose to a Polyanthus. This was before the war. He has now got them carrying beautiful trusses of exceptionally large-sized blooms and in almost every shade of blue; and real blues, not magenta tinted. He is still hybridising for better results. I noticed also in other parts of the garden patches of a new cross that originated with him, viz., *Primula Julia* ×, an ordinary crimson Polyanthus. This has resulted in a very floriferous progeny, carrying bright crimson magenta flowers with the sturdy crinkled foliage of *Julia*—an ideal plant for spring bedding. Yet another novelty I espied; this was a batch of a new type of true Primroses with stellate flowers and in many colours. Here, again, Mr. Neave is working for something better. As I came home in the train I noticed the railway banks and hedgerows in the district covered with many thousands of wild Primroses. Verily, Primroses "were in the air." — H. P.

CLEMATIS-FLOWERED IRISES.

MR. DYKES in his notes on moisture-loving Irises, in your issue of April 7, refers to the origin of Irises of the type of the Bearded Iris *Clematis* in which all six petals reflex. So far as Bearded Irises are concerned, I. *Kämpferi* has certainly nothing to do with the appearance of this type. The parentage of *Clematis* is *Cordelia* × *Princess Beatrice*. It was the only one of the batch of seedlings of the cross which displayed this form. *Clematis* is the most perfect example of this type that I have raised, but the form in varying degree of perfectness has appeared casually from many other crosses of Bearded varieties. It is probably a teratological form—a freak. I should not be inclined to agree with the learned Professor of Innsbrück that this flat form of flower is the archetype of all Irises, since it is the standards that are modified from the normal form, and in assuming the position of the falls they not only take up the special colouring of the falls but also develop (more or less perfectly) a beard. That is, the transformation is from a simpler form of petal to a more highly specialised. If it was a reversion towards an ancient type, one would expect that the transformation would be, on the contrary, from a more specialised to a simpler form. Therefore it is much more likely that the *Crocus* or *Sparaxis* form of flower was the original and most primitive form of the first Iris. But these *Clematis* forms, furthermore, raise interesting questions in heredity, since they do not appear to transmit according to Mendelian laws and, indeed, are not constant, flowers of quite normal form often appearing on the same plant, and even on the same spike as the *Clematis* forms. — A. J. BLISS.

NOTES FROM A NORTH-EAST YORKSHIRE GARDEN

DAPHNE MEZEREUM and *D. Mezereum album* have flowered exceedingly well this year and much earlier than usual, as have so many shrubs and plants after the wet summer, autumn and winter, and in the absence of any severe frosts. *D. Mezereum album* comes into flower earliest and a darker purplish red form is the latest, but they were all over by March 31, when usually the type form is at its best, and one expects to see it about Easter or later in the country cottage or farm house gardens, where it is so prevalent, at any rate in the North. The flowers have a very powerful scent, a very pleasant reminder of their presence when received to the leeward carried by the breeze. It is, I think, especially strong towards evening, but the scent is much too powerful for indoors (at least to me personally). I have a considerable number of plants, and they carry on very well from year to year; although it is a shrub that resents disturbance, many that I have were getting too large and were pruned fairly hard back last summer, but only one resented the treatment. This shrub is included as indigenous to Britain in some Floras, and there are outlying places where it is possible that it may be indigenous, one locality in North-West Yorkshire being well away from habitations; but birds can convey the seed readily for a considerable distance, and it easily strikes. Some greenfinches usually strip the seeds off here, especially the yellow seeds of the white variety, and self-sown seedlings spring up in various parts of the garden. Poor, open soil seems to suit them best, my largest, a white one, being close up to a Box shrub and also adjoining a dwarf Ivy hedge. The bark of this *Daphne*, which is very acrid, seems to be used for medicinal purposes and, according to Nicholson, was imported in quantity from Germany. The lovely sweet-scented white *Daphne Blagayana* seems to be nicely established and making good growth at the lower part of my

heath bank, its roots being planted under the shelter of some of my more vigorous Heaths, stones being placed on the soil above them until they get thoroughly rooted. The flowers set very early and have been gradually opening out all the year, until now they are at about their best.

The *Cistus* family have made considerable growth this winter, and *C. purpureus* and *C. crispus* are, unfortunately, full of flower-buds, which a very little frost will probably kill, and thus delay the actual flowering period if nothing worse. *Prunus Pissardi* was in full flower very early in March, and the flowers and the coppery foliage looked very well against a background of Austrian Pines, alongside of which it was quite unintentionally planted. The early-flowering Heaths that I have, including various forms of *E. carnea*, *E. mediterranea hybrida*, etc., have been, and are yet, very fine. The earliest to come into flower is one received as *E. carnea fragilis*, which has more delicate foliage and beautiful rosy pink flowers, and is dwarfier and more prostrate in habit than usual, and the flowers, being fully developed in January, it is a most desirable form. *E. carnea alba* is just coming into flower, being one of the latest of the group, that is if it is true *E. carnea alba*, the foliage being stiffer and much more upright in growth than the other varieties that I have. These early Heaths, which flourish in quite ordinary soil and live up the garden at a time when colour is not plentiful, should be in every garden. The flowers are also attractive to any bees (that is if any remain in the district) that are tempted out by the early sunny days. [*E. carnea alba* (true) flowers earlier than the type.—ED.]

The beautiful *Hepatica angulosa* was in flower on January 1 and well out by the end of the month, and *H. triloba*, blue and white, commenced with the first week. How lovely these are at the dark time of the year! There is no flower to surpass them when fully expanded

in the sun, the purest white and various blues, some of the self-sown seedlings having deep and bright blue petals, and one plant has very large green bracts, especially noticeable when the flower petals are just developing, shewing like a green-petalled frill to the blue petals. The first *Aconite* opened out on January 8, *Iris histrioides* on January 26. *Iris reticulata* has flowered quite well, but about three weeks earlier than usual. *Tulipa turkestanica* was the earliest Tulip, opening out on March 13. Of three bulbs obtained the winter before last all reappeared (which does not always happen with Tulip species), but only one flowered, having two flowers on the single stem. It is very lovely when fully opened out in the bright sun, the narrow, pointed white petals being reflexed and the stamens with blackish anthers making a pleasing contrast. *Tulipa Kaufmanniana* commenced to flower two or three days later. This is another beautiful species from the wilds of Turkestan. It is delightful when fully opened out in the sun and merits its name of Water Lily Tulip. It is also fine when its creamy petals, often rose flushed, are folded. There is a vivid red form which is very dazzling. My only specimen of this form was worried to death by slugs, which are very partial to this species, and they require watching so soon as there are signs of the growth pushing up through the ground.

The white *Primula denticulata* is flowering exceedingly well this spring, and to me it is much the most effective of the group. I find it is also stronger and less susceptible to excessively damp winters than *P. cashmeriana*, which has a tendency to damp off at times. *P. hirsuta* and *P. pubescens* Mrs. J. H. Wilson are very brilliant and always happy; *P. marginata* is flowering well and the lovely yellow *P. Auricula alpina*, not the show *P. Auricula alpina*, which is very fine in its way, but not so decorative for garden purposes as this with its much more delicate petals. My plants were raised from a few slippings taken in a rectory garden in the hilly parts of North Yorks some years ago, where it was flowering in June. The clumps have a tendency to go off if not "soiled up" in the early autumn. This is usually done with broken mortar or old plaster. The true Oxlip, *Primula elatior*, is truly a gem with its chaste primrose umbels of flowers (very different to the *Polyanthus* hybrid so often called the Oxlip). I am just flowering it for the first time from seed received from a friend who obtained the plants originally from an English habitat.

Saxifraga (Megasea) *Stracheyi*.—This Himalayan species has developed its flower panicles with me for the first time; in previous seasons it has been frosted before full development. This species has the advantage of throwing up its flower-spikes before the leaves develop, and it is quite the best of the group, the whitish flesh-tinted flower panicles being especially beautiful.

Just a warning! Sometimes *Tussilago fragrans* (Winter Heliotrope) is recommended as a useful plant for winter flowering on account of being early and having heavily scented flowers. Recently I saw a mass of this plant with its large evergreen shiny leaves on a portion of a steep railway embankment on the Durham coast, where it had taken absolute possession of many yards and having reached the bottom was coming through the hedge into the arable field adjoining. Our native Coltsfoot *Tussilago Farfara*, very beautiful in flower, is a pest in the garden, but *T. fragrans* looks much worse. The flowers are powerfully heliotrope scented, but it is not a scent that many could stand indoors, being much too strong and, to me, sickly.

T. ASHTON LOFHOUSE.

Linthorpe, Middlesbrough.

"VERY BRILLIANT AND ALWAYS HAPPY," PRIMULA × PUBESCENS MRS. J. H. WILSON.

THE INTERNATIONAL HORTICULTURAL EXHIBITION AT GHENT

THE eighteenth exhibition of the Royal Agricultural and Botanical Society of Ghent was opened by the King and Queen of the Belgians on Friday, April 13, when the immense hall in which the exhibition is held was already crowded with visitors. The Ghent Exhibition is above all things spectacular, the chief feature being the masses of Azaleas in full flower, but when the Royal visitors arrived the crowd was so great that no view was obtainable of the exhibits as a whole.

Immediately after their arrival the King and Queen were conducted to the British Section, where they were received by Lord Lambourne, as President of the Royal Horticultural Society; Mr. Lobjoit, the Director of Horticulture in the Ministry of Agriculture; Mr. George Monro, Mr. J. S. Brunton and others responsible for the arrangement of the section. They then proceeded to examine the exhibits, of which the best were the Carnations of Mr. Engelmann of Saffron Walden and of Messrs. Stuart Low and Co. and the rock garden of Mr. G. G. Whitelegg of Chislehurst. Like all the other British exhibitors, Mr. Whitelegg had been disappointed to find on his arrival at Ghent that the exhibition authorities had been unable to carry out their promises of making preparation in advance and of providing him with suitable stone. However, he eventually obtained from beyond Brussels some limestone from the Ardennes, which closely resembles that which we obtain from Somerset, and did well to construct his garden in the short time at his disposal. It was planted with alpine and such other distinctive plants as *Iris arenaria*, a sand-loving species from Hungary, and the double form of *Caltha palustris*. Another rock garden, of what appeared to be reddish sandstone, was exhibited by Messrs. T. R. Hayes and Son of Keswick and planted chiefly with Heaths and dwarf shrubs.

The centre of the section was occupied by a grass oval, with small beds of Roses and Carnations, among which were noticeable some fine specimens of the bright pink variety *Edward Page*. It was difficult to judge what effect this variety would produce under ordinary circumstances, for the whole exhibition building was flooded with red light from deep red hangings suspended under the roof. The effect seemed to be to make the colours more vivid and often harsher than they would be in daylight, and in particular to obliterate the bluish shades in any pink flower.

Other beds were filled with Daffodils sent by growers in the Eastern Counties, and it seemed a pity that the varieties were not labelled, especially at there were no other Daffodils in the whole Show. They certainly seemed to appeal to some of the visitors, though, strangely enough, there was no sign of any *Narcissi* in any of the gardens we saw along the railway and on a drive to Bruges.

Mr. C. F. Bause of South Norwood filled a bed with the variegated *Dracena deremensis* Bausei, which has a broad stripe of silver down the centre of each leaf; while Messrs. Cragg, Harrison and Cragg of Heston sent a collection of variegated Crotons. East Lothian Stocks came from Messrs. Watkins and Simpson, and an interesting exhibit of dried specimens and photographs of Grasses from Mr. James Macdonald of Harpenden. Mr. L. R. Russell of Richmond exhibited Clematises with his usual skill, and the fruit resources of the Empire were demonstrated by a group of Apples, Pears and Cucumbers from this country; one of

Apples, Pears and Grapes from South Africa; and one of Apples from New Zealand.

The most important British exhibit was not in the British Section, for it was the group of Orchids sent over by Sir Jeremiah Colman and set up in the Orchid Section. It was awarded a special prize of an *Ouvre d'Art*, and was remarkable for the number of well grown specimens of rare or difficult species it contained, such as *Sarcochilus Fitzgeraldii*, with its small white flowers with purple spotted centre. Sir Jeremiah also received prizes for the best *Cœlogyne*, the best *Dendrobium* and the best *Lycaste* in the Show. The last of these three prizes was won with the very pale rose purple variety *Mrs. Hamilton Smith* of *Lycaste Skinneri*, though one might have thought that the judges would prefer the white *L. armeniacæ*.

On all hands it was agreed that no better display of Orchids has ever been seen at Ghent. Messrs. Charlesworth and Co. of Hayward's Heath had some wonderful white forms of *Odontoglossum crispum*, while close by was a group of *Odontoglossum eximium* var. *xanthotes* shown by M. Louis van Houtte, Père. In this the white flowers are flushed with pale yellow at the centre. The prize for the finest group of fifty *Cymbidiums* went to Messrs. Sander and Sons of Bruges and St. Albans, though MM. Bier and Ankersmit of Melle, near Ghent, shewed some wonderful specimens. The group exhibited by Mr. Charles Vuylsteke was confined to *Odontoglossum* hybrids and *Odontiodas*, and the King's prize for the most meritorious and varied group of all kinds of Orchids went to M. Firmin Lambaert of Brussels with the special congratulations of the judges. His group was remarkable for the number of white *Cattleyas* and *Brasso-Cattleyas*, and for a fine *Lælio-Cattleya* *Isabel Sander* with a deep purple lip edged with white, while *Miltonias* were also very prominent.

Messrs. Stuart Low and Co. of Bush Hill Park were also most successful exhibitors of Orchids. Their group was very varied and contained a large number of different species, including the curious green and black *Cœlogyne pandurata*, as well as a pure white *Cymbidium*.

English gardeners who were visiting the Show for the first time were surprised to see how many Ferns, Palms and foliage plants were exhibited, and it is astonishing to what a size they are grown. The remarkable collection of M. Louis van Houtte Père, filled the whole of one end of the chief annexe to the hall, and it is seldom that we see in this country such fine Cycads as those exhibited by Messrs. Sander and Sons.

Perhaps the most interesting exhibit of all was hidden away in one of the numerous side rooms opening off a gallery, but when at last I succeeded in finding it I also had the good fortune to meet the exhibitor himself, Dr. Attilio Ragionieri of Castello, near Florence. This Italian doctor has worked for years on an old strain of *Ranunculus*, and has now evolved a race with flowers 5 ins. or more in diameter and of the most varied colours. Some are as regularly double and as large as the finest show Begonias, and the exhibit came to us all as a revelation of the possibilities of a flower which is now little grown in England. Dr. Ragionieri was also showing his pale pinkish mauve Lilies of the Valley and some coloured Freesias.

Scarcely less remarkable were the large group of white *Hippeastrums* shown by Messrs. Warmenhoven and Sons of Hillegom, and Mr. Krelage's new Tulips, *Amber* (a pale *Clara Butt*), the white

Thémis and the deep orange *Victor*, all raised apparently by crossing early-flowering varieties with Darwins.

The middle of the hall was occupied by a huge oblong surrounded with white and mauve Lilacs, mauve *Rhododendrons* and blue *Cinerarias*. The centre contained pink *Cinerarias*, *Roses* and *Cyclamens*, *Begonia Gloire de Lorraine* and pink *Hydrangeas*, and the whole formed a very successful attempt at colour harmony. The plants were grown and arranged by the firms of the Dutch village of Aalsmeer, which has long been famous for its Lilacs.

This was flanked at either end by the Azaleas from the numerous nurseries in the neighbourhood of Ghent, and visitors from this side were amazed to see that there was no hesitation in placing the vivid orange scarlet of *Azalea indica* *Apollo* and *Spit Fire* next to the pale pink of *Mme. Louis van Houtte*. To our eyes it was intolerable, but many examples made it quite clear that such colours do not clash in Belgian eyes, and a bed of the variety *Magenta* was actually edged with another with bright scarlet flowers.

The Azaleas were simply marvellous. Groups of twenty-five or fifty plants of a variety all exactly alike and all simply smothered in flowers shewed how the nurseries have recovered from the effects of the war. The chief novelty seemed to be the variety *Albert Elizabeth*, with camellia-like flowers of white edged with red, though among the English visitors opinions were divided as to the artistic merits of this variety.

Examples of *Azalea mollis* seemed only to come from the Dutch growers at Boskoop, in the centre of whose group was the variety *Princess Juliana*, with yellow flowers slightly tinged with pink at the tips of the petals. With the exhibit were also two new *Rhododendrons*, a pale pink *Souvenir de Dr. S. Endz*, raised from *Pink Pearl* crossed with *John Walter*, and *Louis Pasteur* with white flowers shading to deep pink at the edge. Of this the parents were the varieties *Mrs. Triton* and *Viscount Powerscourt*.

The French Section was scarcely a success, and certainly many of the French exhibitors themselves were not satisfied. MM. Vilmorin, Andrieux et Cie of Paris shewed *Cinerarias* and other similar plants, but the French taste for art shades of colour does not tend to select varieties that please all eyes, though the pink *Hydrangea Triomphe* exhibited by Madame Fargeton of Angers was certainly a brilliant exception.

The P.L.M. Railway had transported from the Midi examples of all the good garden things that we associate with the Riviera, but when the Sweet Peas are mixed and shewn in the necks of wine bottles which are not hidden in any way, and the huge *Finocchi* or *Fennel* are piled up with giant *Broccoli* and purple heads of *Artichokes* without any attempt at arrangement, we cannot help thinking that the French are capable of better things.

Their Carnations, too, fine as they were, were nothing like as fresh as those in the British Section. The hybrids of *Gerbera Jamesoni* were, however, very fine and very varied in colour. It is a great pity that this fine cross is just not quite hardy enough to do well in any but the most sheltered and warmest corners in this country.

Nothing could have been more kind or more friendly than the welcome extended to visitors from this side by the Belgian authorities, and even though we were somewhat alarmed to find that it seemed to be necessary to play at least seven national anthems on every possible occasion and to make a lengthy speech before each one, we realised that it was being done in our honour.

VISITOR.

TO MAKE THE MOST OF YOUR GARDEN—USE

THOMSON'S VINE, PLANT & MANURE

VEGETABLE

The result of long **practical** experience. In greater demand than ever, after over 40 years on the market. Unrivalled at the present day for every description of Fruit Bearing, Flowering and Foliage Plants, Vegetables, Lawns, etc. A Perfect Plant Food. Moderate in price and of highest quality and analysis. Safe, sure and lasting.

Also THOMSON'S SPECIAL TOP-DRESSING MANURE.

An Excellent Stimulant during the Growing Season.

Prices:

PLANT PESTS AND PARASITES.—A useful booklet on garden troubles by HORACE J. WRIGHT is to be obtained from the Offices of "COUNTRY LIFE," LIMITED, 20, FAVISTOCK STREET, W.C.2; 11d., post free.

35th SEASON.

MRS. PYM'S FAMOUS PLANT

CHEAP AND GOOD.

Send for Catalogue. Magnificent Hardy Perennial Rockery Plants, Alpine Plants, Hardy Climbers, Spring Bedding Plants, Vegetable and Herb Plants, Greenhouse Plants, Summer Bedding Plants.

All transplanted strong and healthy. The hardy plants are grown entirely in the open breezy Fen land and will thrive anywhere. Thousands upon thousands splendid plants (weakly seedlings). All named, beautifully packed and carriage paid. Large or small quantities. No delay. Satisfaction guaranteed. As there is a saving of carriage on large orders extra large plants are always sent.

One of the leading Garden Journals, dated March 17, 1923, says: "MRS. PYM'S PLANTS.—This is a Catalogue of Hardy Plants for beds, borders, rockeries, greenhouse, etc., all of which are in small lots, priced carriage paid and offered on most back terms. There is no plant catalogue more to be recommended to the Amateur Gardener. It is post free from Mrs. Pym, and readers may order therefrom with every confidence of entire satisfaction."

Send for Catalogue or look up my last week's large advertisement in this Journal. Order early and get the best.

Mrs. PYM, F.R.H.S.,

10, Vine House, Woodston, Peterborough

HAVE TEA OUTDOORS!

In the garden during the summer. It's cooler and it saves labour, too. The birds' clean up. It's a welcome change. You can buy from us a

GARDENING OF THE WEEK

FOR SOUTHERN GARDENS.

The Hardy Fruit Garden.

Plums.—For any position on a wall few fruits can equal Plums and Gages and, moreover, they are easily grown in almost any garden. Very little disbudbing is needed, unless the shoots are exceptionally thick, and when such work is done it must be ascertained whether any young shoots are needed to fill vacant spaces. Fruit-spurs are formed on the main branches, and to this end the previous season's growths are cut back to within a few buds of their base at the winter pruning. During the summer the leading or extension growths may be allowed to develop, but all other shoots should be pinched when they are about roins. long and any additional growth stopped at the second leaf. If not already done, the roots should be mulched with manure, as this will not only keep the roots moist but will greatly assist trees that are producing a crop of fruit. When the fruits are set, a daily syringing will be beneficial when the weather is dry, and both green and black fly must be held in check or the young growths will be injured for the season. See that the root-run is kept moist, for trees growing near walls do not derive the same benefit from rain as those planted in the open.

Raspberries as a rule produce plenty of new growths, not only from the stools, but between the rows. Those between may be cut off with the hoe and the rest reduced to five or six of the strongest from each root. New plantations that were made during the winter may have the old canes cut down to ground-level and three or four new shoots left on each plant.

Vegetables Under Glass.

Tomatoes.—Plants that were raised early in the year will be setting their fruits, and will now need copious supplies of water. A top-dressing of loam will be beneficial, and when the roots have taken possession they may be fed with liquid manure or some fertiliser. The latter should be used sparingly, an occasional light sprinkling giving better results than a heavy dressing, which might easily be harmful. Admit plenty of air during bright weather, and remove all side growths as they appear. The main stem should be securely but not too tightly tied to stout stakes or wires stretched along the roof.

The Kitchen Garden.

Beet.—A further sowing of Beet should be made in drills 15ins. apart, selecting a plot which has been deeply dug and not manured. Small, richly coloured roots are preferred and Dell's Crimson is still one of the best in this category. The turnip-rooted varieties may also be sown.

Dwarf Beans.—It is not yet advisable to make a large sowing of Dwarf Beans, but if a warm border is chosen, the chances are that the crop will be a success. Overcrowding is often evident with the beginner, but to secure strong, healthy plants capable of producing a heavy crop they should be given 2ft. between the rows and 15ins. from plant to plant. Canadian Wonder is still a most reliable variety.

General Work.—The seed-beds should be examined to ascertain if there are any failures, and where any of the Kales or Broccoli have been destroyed by birds, fly, etc., a further sowing should be made without delay. Cabbage should be sown, and so may Chervil, Fennel, Hyssop, Chicory, Spinach, Mustard and Cress, and Radishes. Hoeing will be necessary among such crops as Peas, Cabbage and Beans to keep down weeds, which will be making their appearance in all parts of the garden. Clear away non-productive plants, such as Winter Greens, Spinach and Brussels Sprouts, as they not only exhaust the soil but take up valuable space which should be prepared for other crops. Where possible this ground should be trenched and given a liberal quantity of manure, but dull weather or early morning should be selected for such work. Keep a watch for the growths of early Potatoes, and where they are through the soil draw a little of the latter over them as a protection against early morning frosts.

The Flower Garden.

Hardy Ferns.—Now is a good time to transplant or divide and top-dress Ferns, but in doing so avoid any damage to the crowns. The Royal Fern, *Osmunda regalis*, will succeed by the water-side, and others enjoy partial shade, such as dells and near woodland walks. The *Scolopendrium*

and *Polypodiums* appreciate a little lime rubble in the soil, and for top-dressing a mixture of loam, leaf-mould and peat is recommended.

Auriculas.—When these have passed the flowering stage the plants may be lifted, divided and then replanted, keeping the leaves well down to the soil. If a new site can be provided, so much the better, but if not add a little fresh loam to the soil. Select a somewhat moist and shaded spot.

Staking and Tying.—Many of the tall growing herbaceous plants need supports of some description, and whatever method is adopted it should be carried out early before the growths are bent and twisted. The supports should be as inconspicuous as possible, and ordinary pea-sticks will be found as good as any.

Transplanted Trees and Shrubs ought to be examined occasionally to ascertain if they are loose in the soil. If so, they should be made firm and given a stake if necessary. A mulching of manure will be beneficial.

Hoeing.—All borders and beds will benefit by an occasional hoeing to keep down weeds and conserve moisture.

T. W. BRISCOE
(Gardener to W. R. Lysaght, Esq.),
Castleford, Cheltenham, Gloucestershire.

FOR NORTHERN GARDENS.

The Kitchen Garden.

Onions.—Plants raised from seed sown under glass in January should now be planted out without delay. Hoe between the lines or autumn-sown stock, after having given a light dressing of some approved fertiliser.

Cauliflowers raised under glass should now be planted out in lines 2ft. apart, allowing a distance of 18ins. between the plants. Place a ring of soot, lime or sand round each plant to ward off slugs.

Broad Beans.—As soon as a fair crop of pods has set, pinch out the growing points, for by this means the crop will come to maturity earlier and it will prove a preventive against the attacks of the "fly." Draw some earth to the plants of the succession sowing.

Early Potatoes.—These will now be showing above ground, so if there is any likelihood of a late spring frost, draw a little dry earth close up against the tender young growth, for Potatoes, once damaged by frost, never fully recover. Run the Dutch hoe between the rows. This advice applies to young crops generally.

Rhubarb has turned in considerably in advance of the normal period, so will now be showing flower stems freely; cut these over promptly as they appear, as they take a good deal out of the plants if allowed to develop.

The Hardy Fruit Garden.

Raspberries.—As the plants usually send up more canes than it is desirable to retain ultimately, any number in excess of six, or seven at most, should at once be cut away, retaining the most vigorous as a matter of course.

Loganberries.—The young shoots of these should promptly be tied up as they develop, since they are apt to get trodden on if left sprawling on the ground. Those who have adopted the double trellis system will now be convinced of its advantages, making for tidiness and giving both the old and the young shoots the maximum amount of light and air.

Strawberries.—Cut away all runners as they appear, except such as are wanted for young stock. Run the Dutch hoe between the plants and after the lapse of a few days to ensure the death of all weeds, "bed" the plants with clean straw.

The Pleasure Grounds.

Walks and Drives.—This is an opportune time for treating these with weed killer, and the maximum of benefit is likely to be obtained if the operation is undertaken soon after a slight fall of rain, that is to say, when the gravel is in a moderately moist condition. It will readily be understood that on walks edged with Box or other plants with spreading roots, the weed killer should not be applied within less than a foot of the edging. The various brands of weed killer are accompanied by directions as to the strength at which the liquid should be applied. Weed killer may be had in the dry form and is handy for those who have only a small area to deal with.

Forsythia suspensa.—This attractive April-flowering shrub, whether in the shrubbery or grown as a wall plant, should be pruned as soon as it goes out of bloom. As it flowers on the wood formed the previous season, the shoots should be well thinned out to make way for the young wood. *Jasminum nudiflorum* requires similar treatment and, if the pruning was not attended to in course, it should be taken in hand forthwith.

The Flower Garden.

Antirrhinums.—Now is the time to plant, in drifts, clumps or whole beds or borders. Plant about 1ft. apart. A moderately rich soil suits these plants best.

Mignonette.—Plants raised under glass, either in pots or boxes, should now be planted out, from 6ins. to 8ins. apart. Treated thus and duly pinched they will form fine bushy plants, which will produce large spikes of flower in quantity. If the plants are in boxes be careful in lifting them and endeavour to retain as much soil about the root as possible.

Biennials.—All kinds of hardy biennials should be sown within the next fortnight. It will be understood that some plants which are best treated as biennials, such as Sweet Williams, are not strictly biennials, so under this designation come Wallflowers, Sweet Williams, Hollyhocks, Canterbury Bells, *Myosotis* (Forget-me-nots), Sweet Rockets and *Coreopsis grandiflora*. With the exception of Canterbury Bells—which are best raised in boxes in a cold frame—all may be sown in the open in fine soil, care being taken that the seeds are not covered more than ½in. to ¾in. deep. Although the seedlings are to be planted out in nursery lines in due course, beware of sowing too thickly.

CHAS. COMFORT,

Formerly Head-gardener to Mrs. Haig, Broomfield, Davidson's Mains, Midlothian.

GREENHOUSE AND CONSERVATORY.

Lindenbergia grandiflora, from the Himalayas, is nearly hardy and is a very pretty plant which flowers in autumn and winter. It is very easily propagated at this season by means of cuttings, which root readily in a close case in a cool house. The plant's subsequent cultivation presents no difficulty as it only requires an unheated greenhouse during its growing season.

Leonotis Leonurus is a native of South Africa and is a very showy plant which flowers in autumn. The orange-scarlet, sage-like flowers are extremely pretty. It is easily propagated at this time by means of cuttings, which root readily under a bell glass in an ordinary greenhouse. It is a quick-growing plant and should be stopped frequently to induce a bushy habit. This plant grows freely in any ordinary potting compost and should be potted on as it requires it. The plants should be allowed to flower in an 8in. or 9in. pot. In its younger stages the plant may be grown in a cold frame and during the summer months stood in the open, receiving careful attention as regards watering, as it is very subject to attacks by red spider.

Leptospermums are very useful for the cool conservatory and, unlike many other hard-wooded plants, their successful cultivation presents few difficulties. They may be readily propagated at this time by means of small, twiggy, half-ripened shoots, dibbing the cuttings into pots containing sandy peat and standing them under bell glasses in a cool greenhouse. The plants grow freely in good light loam with a little peat added to the compost. *L. scoparium* is an old garden plant which produces its small white flowers very freely. In recent years the two colour forms, *L. Nicholii* and *L. Chapmanii*, from New Zealand, have been very popular; the foliage is also attractive, being reddish-purple in colour. In the West these plants are all more or less hardy and make large specimens in the open. *L. Boscaweni* I find in some ways the best for pot cultivation as it flowers with wonderful freedom in quite small pots. In their younger stages these plants are best grown in a cool house or cold frames and larger plants should be stood outdoors during the summer months.

Leucadendron argenteum.—In South Africa this small tree is confined to a portion of the Table Mountain. It is a very beautiful plant, but its successful cultivation is by no means easy. Like many other members of the Proteaceae it resents disturbance at the root, especially as they get older, young plants for a number of years presenting little difficulty. This plant must be raised from seed, and before sowing it is just as well to file through a portion of the rather hard seed coat. The seed pots must not be kept too

wet, as the seeds are very apt to rot. The plants are best grown at all times in a light sunny greenhouse. The pots should always be well drained and water applied carefully.

Jacobinia floribunda (syn. *Labonia floribunda*) is an old garden plant which was at one time very largely grown for flowering in winter. It is a very neat plant and naturally of a tree branching habit, and in its season flowers with wonderful freedom. It is easily propagated at this time by means of cuttings of young shoots, standing the pots in a close case with slight bottom heat. When rooted the young plants should be potted on as they require it, 5 in. or 6 in. pots being a suitable size to flower them in. During the summer months they may be grown in cold frames, keeping them well syringed during bright weather, as they are rather subject to attacks by red spider. If it is desired to grow on old plants they should be partly pruned back and started into growth in an intermediate temperature. When in flower this plant is best stood in a warm greenhouse. In the immediate neighbourhood of London it suffers very much from fogs.

Rhododendron (Azalea) indicum.—As the plants pass out of flower, they should be placed in an intermediate temperature and by frequent syringing during bright weather should be encouraged to make free growth. Any repotting that requires to be done is best carried out just as the plants are starting into growth. The potting compost should consist of good fibrous peat and sand, although a little light sandy loam may be added. As the plants are usually small, care must be exercised in repotting, firming the compost well down to the bottom with a large label or thin potting stick. Although they are usually grafted, many of the varieties root quite readily from cuttings of half-ripened shoots dibbled into pots of sandy peat and plunged in a warm propagating case. Two of the newer varieties—both in beautiful shades of pink—Daybreak and Bridesmaid, root readily and flower with wonderful profusion in 60 or 48 sized pots.

Royal Botanic Gardens, Kew. J. COULTS.

BOOKS

THE PRIMULAS OF EUROPE.

DR. MACWATT is an acknowledged authority on the *Primula* family, and the volume now issued on the European species (which has been delayed in the press by the binders' strike) will be the standard work on this section of the genus.

Much of the matter in such a work as this must, necessarily, be technical in the extreme, and some of the pages can hardly be described as light reading, being, indeed, intended principally for reference, yet there is also a great deal of very interesting and occasionally extremely amusing matter. How many gardeners, one wonders, know that the colour in our florists' strains of *Primroses* is due to *Primula Sibthorpii*, the Caucasian form of *Primula acaulis*. Another very interesting note about *Primroses*—the double varieties this time—we take the liberty of quoting: "Several new double varieties have been raised, and we may confidently anticipate the appearance shortly of some handsome varieties with double flowers and more vigorous growth than the older favourites. Much of the improvement effected has been due to the consideration and adoption of the Mendelian system, by which, in the third generation, double flowers are produced from single varieties fertilised by the pollen of double *Primroses*." Another paragraph about double *Primroses* shows that Dr. Macwatt is not wanting in a sense of humour. He goes to considerable pains to describe suitable treatment for these beautiful but, in many cases, for from easy plants, winding up with "thus managed, double *Primroses* should thrive." He then advises his readers, if the treatment given does not prove successful, to "plant them in stiff soil among the Gooseberry bushes where the shade is dense and it will be found that they not only grow but flourish."

Every kind of florists' *Primrose* and *Polyanthus* is described, as well as the *Auriculas*, and there

are even recipes for cowslip wine! It is, however, for its decisive placing and careful description of the species and natural varieties, together with its very complete bibliography, that the book will be chiefly valued by those really interested in the genus.

The illustrations are numerous and admirable. More than forty species and varieties are illustrated in half-tone, and there are eight excellent colour plates. The general get-up of the book is first-rate, and no misprints were noticed in it, it is to be feared, a rather hurried perusal, but it is a little unfortunate that specific names which should be in the lower case have through some inadvertence "got upstairs" in the "List of Illustrations." Such things as "*Primula Officialis* var. *Macrocalyx*" annoy many who cannot be accused of being pedantic. It is only fair to state that in the body of the book the naming is unexceptionable.

"The *Primulas* of Europe," by John Macwatt, M.B.; published by "Country Life," Ltd., 20, Tavistock Street, Covent Garden, W.C.2, at 12s. 6d. net.

A Fragrant Honeysuckle.—*Lonicera syriaca* is a deciduous Honeysuckle of easy culture almost anywhere. It is a most adaptable plant, doing equally well against a wall, as a rock garden shrub or when trained up a pillar. Though it has few claims to beauty, the habit being somewhat loose, thin and straggling, and the emerald-green foliage scanty, its flowers are extremely fragrant. These are a bright lilac in colour, much like those of a *Daphne* in shape, and a few of them will pervade the garden with the sweet perfume of a Dutch Hyacinth.

A Noble Marsh Marigold.—*Caltha polypetala* might be described as a greatly magnified edition of the Marsh Marigold, *C. palustris*, and it is an imposing plant for any shallow water or pond margin. Where there is room enough for its long arms to spread (or float) and the soil or mud is to its liking, this giant *Caltha* will cover several square yards with its succulent branches and big, bronzy green leaves. It is, like most of its tribe, an early bloomer, and the first of the clear yellow flowers are often open in March, that is, long before the plant has attained its full dimensions. These blooms are normally rather more than 2 ins. in diameter, which means that they are somewhat small as compared with those of the native Marsh Marigold and hardly proportionate to the size of the plant. Notwithstanding, this *Caltha* is a fine and hearty species, and one that appears to be quite hardy and able to "carry on" indefinitely without attention. It is a native of the Alps of Eastern Europe.

A Beautiful Mertensia. The *Mertensias* belong to the Borage family, and number about twenty species. They vary in habit, but it is here desired to call attention to the charming *M. primuloides*, which has been really lovely during the last few weeks. It forms dense tufts of leaves, reminding one somewhat of the delightful *Omphalodes verna*, and the flowers are borne in racemes on leafy stems from 4 ins. to 6 ins. high. When first they open the flowers are magenta-purple, but change to a deep blue colour which is most attractive. They retain their beauty for several weeks. *M. primuloides* is a native of the Himalayas and is not fastidious in regard to soil or situation, but where possible it should be provided with a cool, moist, partly shaded spot on the rock garden. *M. primuloides* produces a number of underground stems, so it is advisable to place a little broken stone in the soil to prevent it becoming too hard, when the roots would have some difficulty in penetrating and extending. Where the soil is of poor quality it should be replaced with a light peaty loam. This plant

may be increased by division or from seeds, but where possible specimens should be left alone for several years to form as large a patch as possible, when the beauty of this choice species is further enhanced.

A Dutch Dahlia Show.—From September 14 to 23 next the Amsterdam division of the Dutch Company of Horticulture and Botany will hold a great horticultural exhibition in honour of its Golden Jubilee. In union with the Exhibition Committee the Dutch Dahlia Society will hold a great international Dahlia competition. The following prizes will be given specially for exhibitors living outside Holland: First, the most beautiful group of cut Dahlia flowers, new and old sorts, first prize, gold medal and f100; second prize, silver medal and f100. Second, the most beautiful group of cut Dahlia flowers entirely of newest sorts, first prize, gold medal and f50; second prize, silver medal and f50. Those wishing to exhibit in these special classes should write to the Secretary, Mjnhr J. G. Ballege, Witte Singel, Leiden, Holland.

ANSWERS TO CORRESPONDENTS

FLOWER GARDEN.

LILIUM CANDIDUM ATTACKED (D. M. G.).—The Lily is badly attacked by bulb mite at the base, which is quite rotten. Were they newly planted bulbs? The trouble may have been introduced by the bulbs or have been already in the soil. Does the soil contain lime or lime rubble or chalk?

RAOULIA AUSTRALIS (Folsted).—This plant is a native of New Zealand, where it grows in dried-up river courses. It requires a sunny position planted in well drained gritty loam. Plenty of coarse shingle or gritty sand should be mixed with the soil. As it is liable to damp off in the winter, a reserve should always be kept in pots in a cold frame where it can be protected against wet.

MIGNONETTE UNSATISFACTORY (A. C. Kent).—The Mignonette may die off through several causes. The soil may not be firm enough, the plants may be overcrowded, or a fungus may be present in the soil which kills the plants, affecting the stems just below the soil level. Fairly light loam well drained and enriched with some rotted manure and leaf-soil is an ideal rooting medium. Try this compost, thin out the plants while small to 6 ins. apart and firm the soil round them afterwards. Mignonette will grow in gravel paths. A few seeds may be sown on a path, where the plants would not be disturbed, as an experiment. Yes, an Orange tree grown from a seed will flower and fruit. The seeds germinate best in a frame or a mild hot-bed.

TREES AND SHRUBS.

AZALEA ATTACKED (R. E. Row).—The Azaleas are attacked by the Azalea gall fungus, *Exobasidium japonicum*. The removal of the galls as soon as they become apparent is usually sufficient to keep the trouble in check.

FRUIT GARDEN.

GRAPES UNSATISFACTORY (C. L. C. Yorks).—The Muscats have apparently not formed sufficient roots to supply all the water the plants require now leaves are developing. Probably the drainage of the border is not all it should be.

KITCHEN GARDEN.

RHUBARB SEEDING (W. W. F.).—The flower-stems must be cut before they develop much. To allow them to remain uncut would result in considerable weakening of the roots. Surface mulch with rotted manure and also apply frequent doses of diluted manure water.

MISCELLANEOUS.

INSECTS AND PRIMROSES (M. F. Cheshire).—The insects are probably spring tails, but they may merely be feeding on the *Primrose* plant because part of it is dead. They are usually most abundant when the soil is sour, and this is probably the condition which prevails in our correspondent's garden. The addition of chalk would doubtless improve matters considerably. Our correspondent may safely fork in a little naphthalene about infested plants. Do not manure or lime *Lithospermum prostratum*. There are plenty of examples of plants which like lime but whose relatives do not. Thorough drainage, a and lime free soil with leaf-mould to suit *Lithospermum prostratum* well.

NAMES OF PLANTS.—E. C. C.—*Narcissus odorus*, "Campanel."—S. B. S., France.—*Leucojum nigrans*.

THE PRIMULAS OF EUROPE

With Botanical Classification, Descriptions, and
Cultural Instructions

By JOHN MACWATT, M.B.

Crown 8vo., Cloth, 12/6 net; Postage 9d. extra

The aim of the author has been to produce
a handbook that will assist in the identification
of those species of the genus *Primula* which
are native to the European continent, and at
the same time furnish practical guidance to
the cultivation of such of them as have been
introduced to our gardens where conditions
differ so widely from those prevailing in their
natural habitats.

Dr. MACWATT is an acknowledged authority
on Primulas, and his book presents in a concise
and interesting manner the results of many
years of close personal observation and
experience.

Published at the Offices of "COUNTRY LIFE," LTD.,

Notes from Maidstone.

THE CALL of SPRING

At no time is the call of the garden more clamant than in those lengthening days when April turns to May. The weevil now leaves his watery nest and turns to seek his mate: the aphid, long immured in her dark egg, creeps out to fulfil urgent domestic calls.

But what is life to the weevil is death to the fruit & death's avenging hand may not be stayed.

Timely advice on such letal matters is contained in our pamphlet on *Pests of Orchard and Garden Crops*—4d. post free.

FLOWERING PLUMS, CHERRIES AND PEACHES

THE great genus *Prunus* contains many species and varieties of great ornamental value in addition to many sorts rightly highly esteemed for their edible fruits. As regards the ornamental Cherries, their culture in this country is greatly prejudiced by the grafting of the beautiful Asiatic, particularly Japanese, forms on alien European stocks. The result, too frequently, is that the trees make no effective growth at all. If they do get away, however, there is a very real danger that quite a moderate wind will snap off the trees at the graft while they are still young in years. Strangely enough, the trees imported into this country by a well known Japanese nursery firm seem no better in this respect than those worked in European nurseries. That a certain number of trees are worked on suitable stocks is certain, and it is worth a big effort to procure these.

The type of the Japanese Cherry, *Prunus serrulata*, is not definitely known, but double forms of it have been cultivated by the Japanese certainly for centuries. There are quite a number of varieties now in commerce in this country, of which the most remarkable is perhaps the form called *flore luteo pleno* with semi-double greenish yellow blossoms. If remarkable, this variety is also very beautiful and effective. There are double blush and pure white forms, a rosy pink one called *Veitchiana* or (more often in nurseries) *James H. Veitch*, and a deep rose, almost soft crimson, one with handsome bronzed foliage now usually listed as *New Red*. There are several weeping forms, mostly with Japanese names, but the variety called *Cheal's Weeping* is a specially good one. In colouring it lies between *Veitchiana* and the *New Red*, and the growth is exceptionally graceful.

Most, if not all the varieties, are listed under Japanese names as well as the English ones given, and there is some confusion among the varieties in nurseries. This is the season to see the trees in blossom in nurseries and to select varieties. It is not wise, however, to rely altogether on one's own judgment: the nurseryman can speak with some authority on the vigour and growth of the tree. It is very seldom that the forms of *P. serrulata* grow taller than 20ft. or so in this country, but *New Red* is very vigorous and shows signs of easily passing this limit. The "yellow" flowered form is also rather a strong grower, whereas *Veitchiana* and some of the weeping forms are much less robust. *Prunus Watereri* is closely related, and is provisionally placed by Bean under *P. pseudo-cerasus*. *P. Sieboldii* is also classed as a form of the same species. *P. Watereri* is a handsome double-flowered Cherry with white blossoms deeply tinged with rose. It makes a good standard, but is perhaps rather a slower grower than most of the forms of *P. serrulata*. Another Japanese species is the Rosebud Cherry,

Prunus pendula, a specimen of which is illustrated on this page. This species is said ultimately to attain a height of 50ft. or 60ft. in Japan, but in England it is usually seen worked on a European Cherry stock, and specimens above 15ft. or so in height are all too uncommon. Even these dwarf specimens, however, are exceedingly picturesque and make inviting "bowers" in summer for those who have no dread of creeping things! The flowers, which expand a little before English cherry-time, are rather small—about $\frac{3}{16}$ in. across—and not very widely expanded—they open a bright rose, but lose colour very rapidly. A tree in blossom is, none the less, a sight to be remembered, for the blossom is produced in extraordinary profusion. A western exposure is desirable to minimise the risk of damage to growth and flower by spring frosts. It is to be found in catalogues under some extraordinary names, such as "*P. sinensis rosea pendula*."

Prunus subhirtella is another species of the same section; indeed, there are those who consider *P. pendula* merely a variety of this species. There are, however, many points of difference apart from habit of growth and *P. pendula*, at any rate, reproduces itself from seed. The blossom of *P. subhirtella* is similar in colouring and appearance to that of *P. pendula*, but the tree is of upright habit and, apparently, a smaller grower than the last named. It is a very beautiful species, but not yet grown to any great extent—it was not introduced to Kew until 1895—and appears to be less subject to damage by spring frosts than *P. pendula*.

Closely related again to *P. subhirtella* is *P. microlepis*, often listed by nurserymen as *P. Miqueliana* or *P. subhirtella autumnalis*. The flowers of this species in the form we have in this

A YOUNG TREE OF PRUNUS PENDULA.

country, which was distributed by Mr. Tom Smith of Newry, are double, pinkish white in colour and produced with considerable freedom in November and December. No other *Prunus* flowers in those months, and it is exceedingly valuable owing to the scarcity of blossom at that season.

Of the European Cherry species the *Gean*, *Prunus Avium*, is perhaps the most beautiful. It is admirable on the edge of woodland. For the garden the splendid double-flowered form is even more beautiful. Both, in time, make trees of considerable size. *Prunus Cerasus* is a lowlier species, which spreads freely by underground suckers. It has no garden value, but the double form, sometimes known as *Prunus* (or *Cerasus*) *emmeniflora*, is valuable.

Prunus Padus, the Bird Cherry, is a tree often planted, but it can scarcely be called effective when in flower, though the fine form *Watereri* is quite effective. Here again, however, the double form is the showiest and most attractive. There are many more species of the Cherry kindred, but the best have probably been mentioned.

Turning now to the Plum section of the genus, few species are more beautiful when in flower than the Blackthorn, *Prunus spinosa*, and the splendid double form is worthy of a place in every garden. There is now a pink-flowered variety with purple foliage known as variety *purpurea*. The Myrobalan or Cherry Plum, *P. cerasifera*, is very beautiful when in flower in March. The pure white blossoms are produced in extraordinary profusion. Well as this species is known to gardeners, it is probable that its purple-leaved variety *Pissardi* or *atropurpurea* (*Prunus Pissardi*

of catalogues) is even better known. This is an excellent small tree, less showy than the type with its rather nondescript coloured flowers, but useful for its deep purple foliage. It has, unfortunately, been greatly overplanted in some gardens. This does not now represent the best type of the purple-leaved Myrobalan, both *Bhrejana* and *Moseri* with doubled flowers being much superior in form and colouring.

The Japanese Plum, *P. triloba*, is an ornamental tree not very dissimilar to the Myrobalan. Neither is of commercial value in this country for the fruit. *Prunus dasycarpa*, the Black Apricot, appears to lie between the true Plums and the Apricots. It seldom fruits in Britain, but the beautiful "crimped" snow-white flowers are very lovely in March.

With *Prunus Mume*, the Japanese Apricot, we come to a species which unmistakably belongs to the Apricot section of the genus. This species has been taken in hand by the Japanese florists, so that, in addition to what we have come to regard as the typical shell pink form, there are single and double pure white varieties, a double rose one and an attractive weeper.

The Peach section of the family is not a large one, but such species as there are are practically all of great decorative value. The beauty of the Almond needs little stressing. There is little to choose between the Bitter and Sweet varieties as far as floral beauty is concerned, but the variety *præcox* is worth planting because it extends the flowering season. In favourable seasons it is usually in flower before February is out.

The Peach is a particularly beautiful but not

very hardy tree which is, unfortunately, rather short-lived, especially when grafted upon the Plum, which is the stock usually employed. Many of the varieties are so lovely, however, that few of us are prepared to dispense with them. The double red, double rose and double white are all splendid, but perhaps the finest of all is the huge-flowered double crimson called *magnifica*.

The Dwarf Russian Almond, *Prunus nana*, is a very beautiful shrub, seldom growing more than 1 ft. tall and readily increased by layering. The flower-buds are a brilliant rosy red, but the expanded blossoms rapidly fade to pale rose. The variety *georgica* is taller growing, but equally effective, and there is a form with larger flowers called *Gossleriana*, which is perhaps best of all. The pure white variety is quite effective in a different way. This species flowers with the Lilacs and Barberries, but is beautiful enough to hold its own even at that season.

Prunus Davidiana is quite different, for it forms a slender-growing, rather small tree with fairly large white or (in the variety *rubra*) rosy blossoms which often expand in January. It should, naturally, be given a sheltered position, but the flowers withstand the weather well. *Prunus triloba* is best represented in gardens by the very beautiful double variety, which wreathes itself in fully double soft rose blossoms. It is usually worked upon a Plum stock, and is thus not so popular as it should be, for, apart from the constant trouble with suckers, *P. triloba* is not long-lived upon the alien stock. Plants propagated from layers, however, are hardy, vigorous, free and lasting.

AN EXCELLENT ORNAMENTAL CHERRY, *PRUNUS SERRULATA* CHEN'S WEEPING.

A TYPICAL SPRAY OF FLOWERING PEACH, *PRUNUS PERSICA* VAR. CLARA MEYER.

THE GARDEN SPIRÆAS

THIS heading, while including a large number of delightful border plants, is not intended to embrace the shrubby varieties. Not that these are one whit less beautiful, but they are suited to an entirely different kind of planting, and I propose to-day to deal with those of a herbaceous character, which should find a home in some part of every garden.

And this brings us to the question of where to plant—an extremely elastic one, as we shall see. Widely as they differ in character, one and all share the same love for a moist and cool position, where the roots are never exposed to anything like drought. In many gardens, then, we must plant in semi-shaded places, for it is here that they are likely to suffer least in this direction. But (let us get this quite clearly) shade does not mean overhanging tree boughs; the *Spiræas* detest these and cannot acquit themselves well when exposed to the inevitable winter drip that falls from the branches. The addition of some rough peat to the soil is a great advantage, as this acts as a sponge and holds the water for an extended period. Where one is sufficiently lucky to have a stream passing through the garden or a small pool from which moist banks slope gradually upwards, one need not consider the question of shade at all, the *Spiræa* simply exults in the ever-damp loam and quickly forms great clumps of noble foliage, crowned in the flowering season by splendid panicles of feathery plumes in pink, cream and white. Never do the *Spiræas* flower so gloriously as under such conditions as I have sketched, and whenever such a sunny swamp garden can be arranged it is beyond question the site *par excellence* for their cultivation.

During the growing season they love to be dewed overhead on the evenings of warm days, and when drought is persistent enough water should be poured upon the ground to saturate it twice a week. No plant shews distress by drooping its foliage more than the old-fashioned *Spiræa* (*Astilbe japonica*), while a certain amount of protection is also advisable for this in cold districts in early spring or the foliage is apt to be badly cut by frost.

The newer pink developments in this variety are simply wonderful as garden plants, and by massing in really bold groupings splendid pictures are achieved in June and July. An interesting variety of this that is very well worth securing, is the variegated *aurea reticulata*, every leaf of which is picked out in golden yellow veinings. Two other very handsome varieties that shew a

similar peculiarity are found in our common Meadow Sweet (*S. Ulmaria*), an ideal plant for streamside planting. These are known as *aurea*, white with golden foliage, and *variegata* in which the leaves are green and white.

If a vote were taken, I think that *S. Aruncus*, the Goat's Beard, would probably be found to

THE GOAT'S BEARD, SPIRÆA ARUNCUS.

head the list, with its great creamy white plumes in June and July that make it one of the most conspicuous plants in the whole garden. A variety of this, *S. Aruncus Kneiffi*, with graceful feathery plumes and finely divided fern-like foliage, would probably run it fairly close, and is capital for a small garden, as it is a foot less in height, at 3ft. The Dropwort is best in its double form—*filipendula* fl. pl.—but it is a plant for masses, and never looks well except in large clumps. Silver Sheaf, 2½ft. tall, is a particularly fine *Spiræa* in May and June, and if well supplied with water makes a noble border plant. *S. gigantea*, synonymous with *camtschatica*, is only suitable where space is ample, for it not only grows tall, but spreads widely in addition. The leaves are large, handsome and palmate in form, while at a height of 6ft. to 8ft. the flowering stems are crowned with immense heads of pure white flowers. Particularly charming is *S. venusta*, which requires bog to grow it successfully, and few finer plants can be found than this for planting in peaty loam, where the moisture overflows the bank from time to time. Much depends upon the available supply of moisture and the length of time it has been planted as to what height the growth will reach,

for it is anything between 3½ft. and 8ft., the feathery plumes at the top being a lovely rose pink.

S. palmata, again, is a bog lover, native of Japan, that is suitable for gardens of medium size, as it does not exceed 3ft. in height and is restrained in habit. The leaves are large and handsome, with deep red stems surmounted at the top with large heads of crimson blossom that are extremely attractive. *S. rivularis major* is a vast improvement upon the typical form, and bears splendid branching plumes of flower at a height of about 4ft. during June and July.

In growing the *Spiræas* it should never be lost sight of that they are surface-rooting plants which make a close compact mass of crowns right on the surface of the soil, therefore it is no use to place a quantity of manure deep in the ground. Dig deeply before planting and never omit to mulch to a depth of 3ins. each spring with old manure.

H. W. CANNING-WRIGHT.

EAST LOTHIAN STOCKS

THE short period necessary to bring them to flower has bestowed an undue popularity on the Ten Week varieties of Stock, and has had a detrimental effect on the splendid East Lothian strain. I admit that these latter are more trouble and "on hand" for a longer period and that they have to be given the protection of a frame in most parts of the country to bring them through the winter, but, with it all, they are worth it for the magnificent display of massive fragrant heads that they bear in June, July and August. Seeds should be sown in May ready for the following year, for it is only by a long season of steady growth that those grand, many-branched, 2ft. tall specimens may be ensured.

Make a bed of light yet rich soil in a shaded cold frame and sow the seeds thinly and evenly in shallow drills and keep moist without much watering until they are well through the ground, when plenty of air should at once be admitted. When well in growth more water will be necessary, for it is important that the plants never hang fire nor stand still. As they become large enough to handle easily, the little plants should be potted off singly, using a similar soil to that in which the seed was sown and standing the plants outdoors on an ash bed in an open, sunny position. Here, beyond regular watering, they will demand but little attention until November, when they should again be placed within the shelter of a cold frame.

The plants are very nearly hardy, so that they must not be made soft by coddling. Give plenty of air and water rather sparingly. Indeed, the main point in placing in the frame during winter is to keep them dry, especially as regards the foliage, and while in this condition they will stand considerable cold with impunity.

The beginning of the following April preparations should be made where the plants are to flower and for this thoroughly prepared beds or borders are essential. Harden off the plants by exposing to the weather both night and day for some time previously, and see that the soil has been both deeply dug and well manured. The richer the soil the greater the space that should be allowed between the plants; 18ins. being none too much for vigorous specimens. When well growing again mulch the surface and see that the plants never suffer from want of water. The colour range is as wide and comprehensive as that found in any other strain of Stocks and the heads are simply immense, individual flowers being as large as a Carnation.

CROYDONIA.

PLANTS FOR THE HEATH GARDEN

(Continued from page 207.)

EERICA MULTIFLORA, a native of Southern Europe, is closely allied to the Cornish Heath, *E. vagans*, but is rare in cultivation. Of spreading habit, it grows from 1ft. to 2ft. high, and bears rosy red flowers in autumn.

E. scoparia, a native of Central and West France, grows 10ft. high with thin, wiry, secondary branches and inconspicuous greenish flowers borne in early summer.

E. stricta.—Although often found between 2ft. and 5ft. high, this South European species may reach a height of 10ft. It is of bushy habit and bears its rose-coloured flowers freely in July. The flowering period is shorter than that of most Heaths.

E. Tetralix, the Cross-leaved Heath, is a spreading plant about 12ins. or 15ins. high, found wild in many parts of Europe and in the British Isles. The leaves are in whorls of four which roughly represent a cross. The flowers are urn-shaped, and borne in clusters from the points of the branches during summer and autumn. The varieties *alba* and *mollis* have white flowers.

E. vagans, the Cornish Heath, is found wild in Cornwall and through South-West Europe. It grows about 1½ft. high, and forms a wide spreading mass, bearing cylindrical racemes of pinkish flowers from August to the end of October. This is an exceedingly attractive and free-flowering kind, and its colour varies in its forms *alba*, *grandiflora*, with very fine reddish flowers, and *rubra*. Finest of all is var. *kevernensis* with brilliant salmony blossoms.

E. Veitchii is a hybrid between *E. arborea* and *E. lusitanica*. It forms a large bush and bears white flowers with great freedom in spring.

Calluna vulgaris is the Ling or Heather of our commons and hillsides, where it is often found in company with *Erica cinerea*. Although it may grow 2ft. or 3ft. high, it is usually less than

18ins., and sometimes scarcely rises rim. above the ground. It can be distinguished from the true Heaths by its opposite leaves, arranged in four distinct rows. The flowers are borne from one side of a long, upright terminal inflorescence during August and September. They are pale reddish purple in colour, but many shades of colouring may be found on one hillside, including plants with white blossoms. Among the many named varieties are *alba*, *alba minor*, *alba pilosa*, *alba punula*, *alba Serlei* and *Hammondii* with white flowers; *Alportii* with purplish blooms, *coccinea* with crimson flowers, *hypnoides* and *tenuis* with purple blossoms, *aurea* with golden foliage, *cuprea* with copper-coloured leaves, and *Foxii* and *minima* of dwarf moss-like habit.

Daboecia polifolia, St. Dabeoc's or Commemora Heath, is a small shrub which grows from 1ft. to 2ft. high, a native of Western Europe, and also found wild in Ireland. The urn-shaped flowers are reddish purple in colour and are borne in long, upright, one-sided racemes. An early crop of

THE SPRING-FLOWERING ERICA VEITCHII.

flowers appears in June, but the principal flowering period is from the middle of August to the middle of October, when the plants are quite covered with blossoms. There are several varieties, of which *alba* has white flowers, *atropurpurea* richer coloured flowers than the type, and *bicolor* bears red and white flowers, or red and white striped blossoms on the same stem. A very distinct form with a more spreading habit of growth and rounded bells, much larger than the type, is known as var. *globosa alba*. No globose form with the rich purple colouring of the typical St. Dabeoc's Heath is known, but an infinite variety of shades of rose and lilac can be obtained by crossing the purple form of the species with *globosa alba*. This species is one of the most useful dwarf shrubs we possess, and when planted in large masses it is difficult to imagine anything more beautiful.

No part of the grounds is likely to provide more interest throughout the year than the Heath garden. Not only may blossom be found there throughout the year, but the immense variety of foliage lends perennial interest. To take the Ling as an example, what an immense and effective contrast is provided by planting in juxtaposition the varieties *Alportii* and *Serlei*, for example, the former with dark grey, almost black, foliage and the latter with leafage of a vivid, all but emerald green! The rather "fox-tailed" foliage of *Erica stricta*, too, is always interesting and beautiful and the curious ruddy brown of the long-dead flowers adds to, rather than detracts from, that beauty in the dull days of winter. The mossy-looking varieties *Foxii* and *minima* are equally attractive.

W. D.

SPRING IN THE HEATH GARDEN, GRAVETTYE.

THE SPRING ROSE SHOW

THE Spring Show of the National Rose Society cannot, in the nature of things, be so interesting as the autumn fixture, to say nothing of the great Summer Show in Regent's Park. This notwithstanding, there was quite an interesting display awaiting the crowd which at midday surged into the Royal Horticultural Society's Hall on Friday, April 20. There really was a crowd, so that it was difficult to inspect the exhibits as thoroughly as one would wish. If the Society could allow a few minutes for the Press to inspect the exhibits before the public are admitted, it would unquestionably be doing itself a service.

In the class for a group of pot Roses not to exceed 100 square feet in area Mr. W. E. Chaplin of Waltham Cross was placed first. Noteworthy on his exhibit were Mrs. Tresham Gilbey, which will be found described under "New Roses," the new Rambler called The Beacon and the brilliant Queen Alexandra Rose. Mr. Elisha Hicks was second. On his exhibit a standard Ellen Poulsen was very effective, so were the beautiful golden species Hugonis and that admirable "poly-pom," Coral Cluster, which bids fair to become one of the most profitable Roses to force, either for decoration in pots or for cut flower. The third prize was awarded to Messrs. W. Cutbush and Son, Barnet, who had a very showy exhibit, largely featuring the Polyantha varieties, including masses of Ellen Poulsen. On close inspection many of the blossoms in this exhibit were seen to be rather the worse for wear, but certainly the Polyantha varieties make the best display in pots

at this season. The buttonhole Roses, if the term may be forgiven, are admirable for cut-flower when forced; however, they are altogether too leggy to be effective on the plant.

In the other class for plants in pots—six pillar Roses—the placings were reversed, Mr. E. J. Hicks easily securing the first place with six very good plants of Dorothy Perkins, Shalimar, Scarlet Climber, Minnehaha, Exeelsa and Lady Gay. Mr. Chaplin's second prize group was noteworthy for a splendid plant of the new rosy crimson Beacon. This is evidently a multiflora variety, and the colouring as shewn now was a shade deeper than that of American Pillar as grown outdoors. If grown outdoors it might probably be described as an improved Carmine Pillar.

In the big open class for cut flowers Messrs. Benjamin Cant and Sons were placed first and Mr. George Prince of Oxford second. On the exhibit of the Colchester firm Paul's Scarlet Climber was shewn in exceedingly good form, so was the old and beautiful Noisette mis-named Fortune's Yellow. Sovereign was also well shewn, and a nice bit of colour was supplied by Padre and The Queen Alexandra Rose. A fine bit of golden colour proved to be Rev. F. Page-Roberts, and Covent Garden was also in good form. On Mr. Prince's exhibit, among many fine groups, Coral Cluster and Souv. de Claudius Pernet attracted attention, together with a fine grouping of the Austrian Copper, which appeared to be new to many visitors!

Competition, unfortunately, was not keen in the classes for bowls and vases. Miss Ethel

James of Abingdon secured the first prize for a bowl containing some excellent blooms of the bright crimson Richmond. Mrs. Colston Hale was second.

Mrs. Courtney Page received a first prize for a vase of the popular Ophelia. Mrs. Charlton of Viewsley was second with some good blooms of Mme. Butterfly. In the nurserymen's class there were only four entries, and Mr. Elisha Hicks was first with a bowl containing some superb blooms of Lady Hillingdon. Mrs. Tisdall was second with Melody, the blooms of which are of a deep saffron yellow with primrose border.

For a collection of cut blooms Mr. Holland was awarded the first prize. This was the only entry in this class. The blooms were exceptionally good, but, unfortunately, the exhibitor had no labels attached to the various varieties. The arrangement, too, was susceptible of improvement. Such lack of naming is unfortunate, because it is little use for a visitor to admire a Rose if he cannot readily ascertain the name. Even for the expert it is sometimes difficult to identify with certainty blooms that have been forced under glass, as, of course, these had been. That remarkable species Rosa Moesni was well shewn in this collection.

In the class for twelve blooms of any varieties, Mr. Goodwin was first with Marechal Niel. Mr. Elisha Hicks was a good second with Mrs. H. Winnett.

In the class for twenty-four blooms, in not less than eighteen varieties and not more than three blooms of any one variety, Messrs. Ben. R. Cant and Sons were first with exquisite blooms of such well known varieties as C. V. Haworth, Souv. de Geo. Beckwith, Mrs. Foley Hobbs and

A GLOBULAR PINKISH BLOSSOM OF MRS. TRESHAM GILBEY.

FRAGRANT BLOSSOMS OF THE ODDLY-NAMED DECEPTION.

their new Rose Captain F. S. Harvey Gait. Mr. Elsha Hicks was second with such sorts as Earl Haig and Mrs. Elsha Hicks.

For an amateur's collection of twelve blooms in a box, consisting of not less than six distinct varieties, Mr. E. J. Holland was first. He had some excellent blooms, and the following are a few of the good things shown: Mrs. Foley Hobbs, Silver Medal, Mrs. Edward Mawley, Victory and a superb bloom of Mrs. J. Welch. Mr. G. A. Hammond was second with such excellent sorts as Mme. Melanie Sompert, Mrs. Myles Kennedy and Mrs. Foley Hobbs.

In the class for six blooms of any one variety, Mr. E. J. Holland was again placed first with excellent blossoms of Mrs. Foley Hobbs. Mr. G. A. Hammond was the runner-up with good flowers of Mrs. Amy Hammond.

In the basket class for nurserymen Mr. A. T. Goodwin of Maidstone was first. He showed that "good old stager" *Maréchal Niel*. Messrs. Bees, Limited, were second with Evelyn Thornton.

For three baskets of cut Roses, three distinct varieties, Mr. Elsha Hicks was first with excellent blossoms of Lucile Barker, Evelyn and Mrs. H. Winnett.

Turning now to the "basket" classes for amateurs, Mr. G. A. Hammond was the only competitor in the class for a basket of mixed blossoms, but his contribution was a very effective one, and he well deserved the first prize awarded. In the class for a basket of one variety, Mr. E. J. Holland was first with a very good basket of William Shean. All the blossoms were large and some of remarkable excellence, others a little soiled. Mr. Hammond was second with very bright and good blossoms of Mrs. Amy Hammond.

The table decoration classes were, as usual, confined to lady members. In the amateurs' class Mrs. Courtney Page secured the first prize for a delightful arrangement. The blooms employed were Mme. Butterfly—the "favourite" in this section. Mrs. Colston Hale of Warminster was a good second. In the nurserymen's class Mrs. Bide was awarded the first prize for a charming arrangement, also of Mme. Butterfly. Mrs. Tisdall of Woodford Green was second, and here again the same popular variety was employed. Competition was fairly keen and the arrangement of the blossoms, generally speaking, was excellent, as, of course,

Roses, rose bowls, vases and a multitude of other things likely to gladden the heart of the keen gardener. Abol, Limited, shewed and demonstrated their world-famed syringes and insecticides. Messrs. Prentice Brothers exhibited fertilisers.

One hardly expects the rose-growing fraternity to be able to fill the R.H.S. Hall at this early season with Roses. Assistance was rendered by Messrs. Allwood Brothers, Mr. Englemann and Messrs. Stuart Low and Co., who brought up Carnations, and Messrs. J. Cheal and Sons who shewed Dahlias, including *Crimson Star* and *Yellow Star*. They also staged many forms of the great *Pyrus* and *Cytisus* families, also well flowered sprays of *Berberis stenophylla*. Messrs. John Waterer, Sons and Crisp had an interesting collection of alpinists, including *Primula Munro*, *Irises pumila* and *cyanea*, *Trillium grandiflorum*, well flowered plants of that little gem *Morisia hypogaea* and *Erythronium Pink Beauty*.

NEW ROSES.

Deception (H.T.).—This is a Rose which would appeal to our old friend the Rev. Joseph Jacob, and which evidently attracted the judges, for they awarded it the coveted "gold." It is a rose-coloured variety of more than average size and by no means thin. The petals, too, are fairly substantial, and the flowers, which would have been considered shapely three decades ago, are rather clumsy according to modern ideas. It appears to be a good grower, however, and has one merit which it is hard to overvalue—the possession in abundance of the true old-rose scent. The name does not appear a happy one. Gold medal to Messrs. G. Beckwith and Son.

Geraldine (H.T.).—It was impossible to find a normal colour for this variety, for there were no two flowers alike. The prevailing colour, however, appears to be buff, and this apparently

always tinted—either with pink, blue or salmon! The foliage is fairly stout, but the flowers are small and rather undistinguished. Shewn by Mr. W. E. Chaplin.

Hypatia (H.T.).—A rather small variety, the blossoms pink, suffused copper and very bright in their early stages. As shewn it scarcely seemed any improvement upon Mrs. A. R. Waddell, which it certainly calls to mind. Shewn by Messrs. Bees, Limited.

Joan.—Another variety shewn by the same firm, this time a dwarf Polyantha. The flowers are large for this section, rather floppy and apparently not too freely borne. This did not strike us as at all an attractive variety.

Lady Charmian (H.T.).—This is a very pleasing variety of medium size with reflexed pointed petals. The colour is rather difficult to describe, but cerise with a hint of vermillion cannot be far wrong. In colouring, at any rate, this variety recalls the glorious *Lady Inchiquin*. Certificate of merit to Messrs. Bees, Limited.

Mrs. Beckwith.—This would appear to be first-rate for under glass. The colouring is cream or ivory, centred bright lemon yellow. The flowers are large-petalled and of good size and, if the petals are rather spade shaped, by no means inelegant. An attractive and quite pleasingly—but not heavily-scented variety. Certificate of merit to Messrs. G. Beckwith and Son.

Mrs. Tresham Gilbey.—This is a large Rose of rather globular conical outline, and reminds one somewhat of *Dean Hole*. Thin-petalled and, as shewn, very variable in colour—some of the blooms were shell pink with a hint of salmon and others salmon buff with more than a hint of carmine—the one really good flower must have made a big impression on the judges, for they awarded the gold medal. Shewn by Mr. W. E. Chaplin.

THE MIDLAND DAFFODIL SHOW

THE Annual Show was held as usual in the Botanical Gardens at Birmingham, on Wednesday and Thursday April 18 and 19. Although the space occupied by the exhibits was not as extensive as usual, there were plenty of

Dutch-raised trumpet *Fantini Latour*—undoubtedly a very striking flower. *St. Nicholas*, a pure white-perianthed *Barrii* with an orange eye edged rich red, and *Caedmon*, with its pretty recurved-like perianth, also shewed up well. Messrs. J. R. Pearson and Sons, whose connexion with the Society is pre-natal, going back to the time when the "Midland" was without form and void—to those far-away days when the shows were held by the authorities of the Botanical Gardens themselves and when our modern varieties had not come into being—occupied, as usual, one of the frontages of the Curator's house. After their miss last year it was pleasant to see them again with a good silver-gilt medal assortment of flowers new and old. I always like the "Poet" *Acme*—I am not quite sure if it is not my favourite "Poet." There were two vases of it in excellent condition which shewed the charming soft dull red colouring of the perfectly flat eye to perfection. It is, of course, a tremendous contrast in size to the superb *Poet Grand Opera* staged in the "single bloom" competitive class by Mr. Herbert Chapman, but it is a most charming, *chic* and fairly cheap flower. In this group I also noted that very handsome *Poet*, *John Masefield*, which is distinguished by a slightly reflexing perianth and an attractive red-edged eye. There were one or two good vases of *St. Iorio*, which is a grand late-flowering *Barrii* with a white perianth and the palest yellow cup imaginable, edged pinky buff. Another silver-gilt collection was put up by Mr. Guy Wilson from Ulster. He was the only representative from the Emerald Isle to put up an exhibit, as the Donard Nursery Company had to scratch

MRS. COURTNEY PAGE'S PRIZE-WINNING TABLE DECORATION.

one would expect under the deft fingers of the ladies.

Among the "sundries" proper Mr. R. Pinches of Acme label fame brought up many good things useful to the Rose enthusiast. Here were to be seen labels suitable for all kinds and classes of

good flowers scattered among the exhibits. Messrs. Barr and Sons filled their accustomed place at the end of the annex with a highly meritorious group, which was awarded a gold medal and which included, bang in the centre, a grand bit of deep yellow colour in a few blooms of the massive

at the last moment; and although Mr. J. L. Richardson from the Southern Free State arrived about midday, I am sorry to say he had left his tail behind him. I hope he will not have to do it again. We want as many flowers as we can get from Ulster and the Irish Free State, for, however many things divide them, they have this in common—they can both grow wonderful Daffodils. Mr. Wilson's flowers amply proved this as far as Ulster is concerned. Not only did he put up a fine group, with a bold mass of the splendid Giant Leedsii Tenedos in the centre, but out of five entries in the competitive classes

likely to assist in the quest for that *doubtfully desirable* guest—the Red Daffodil! The italics are mine. It is a fact that these strange newcomers leave many of us cold. We ask ourselves the question that most likely my New Zealand friend did, "Should we really like a red perianth if we got one?" and we, as he did, answer "It is doubtfully desirable." I have very little doubt that had that patient alchemist, Mrs. R. O. Backhouse, been granted a longer life she would have given us something in perianths akin to her big red cups or bowls—I cannot call that huge bit of redness that one saw in one of the exhibits

days, taken off in, hat in its presence. You are before a real lady.

To add variety to the exhibition there were excellent exhibits of Azaleas and various other plants from Cuthbert's, Hewitt's and Bakers', and also two round baskets of the famous Spetchley Polyanthus, one of mixed colours and the other all yellows and whites. I do not think any strain in the world can beat them for size. A few "pips" with diameters from 2ins. to 2½ins. make a fine big head.

SPECIAL FLOWERS. "Which is the best flower in the Show?" was a question I was asked several

OPERA, A WHITE PERIANTHED BARRII. AT FOR THE SHOW BENCH.

JESSIE, A WHITE PERIANTHED BARRII OF IMMENSE SIZE.

The two pictures are to the same scale.

he secured four firsts and one second. I thought his six yellow "trumpets" were exceedingly good. They included Golden Flag, a flower of great refinement and with a beautifully smooth texture; and Bulwark, a golden yellow of a rather paler shade and with a perianth of 4½ins. diameter set at right angles to the big bold trumpet.

The Welsh Bulb Fields were represented by an interesting group, which, like their printed list, contained a goodly percentage of home-raised seedlings. The feature that more especially attracted my attention was the small collection of four varieties of pinky perianth blooms, which shewed that the wonder flowers, illustrated in the R.H.S. Daffodil Year Book of 1913, are becoming more numerous—Dr. Lower had a fifth in his "thirty-six" group—and more highly coloured. In a review of the above-mentioned book by Mr. A. E. Lowe of Tai Tapu, Christchurch, New Zealand, reference is made to the picture in these words: "This will no doubt point the camel's hair pencil towards pollen that will be

for the Cartwright (Dr. Lower's, I think) anything else. These cups were the distinguishing feature of both the London and Birmingham shows of 1923. A visitor to either who wanted to know who Mrs. Backhouse was and what she did might truly be answered by the well known quotation from Wren's epitaph in St. Paul's, "Si monumentum requiris circumspecte." The firm of Cartwright and Goodwin have undergone various vicissitudes of late years, but it is taking a new lease of life under the present ownership, and as a result a good and pleasing exhibit was staged. I did like the great big yellow trumpet Ben Alder. It may not have the beautiful symmetry and lovely texture of Dr. Lower's Royalist, but, like King Alfred, it is a flower that will appeal to a wide circle of admirers with the delicious twist of its inner segments and the bold recurve of its massive trumpet. As a contrast I would mention two exquisite vases of the old type Leedsii, Hypatia. It is refinement itself. I have, ever since I first saw it in my middle-age Daffodil

tunes when note-taking on the nice quiet second morning of the Show. At breakfast I had been told a tale of a Sunday School teacher who had been talking to her class about "Crowns of Glory." To see how far her lesson had been assimilated by the children she presently asked "Who do you think will have the largest Crown?" A sharp child at once answered, "Hum, with the biggest head." It is nothing like so simple to say which is the best flower. I did not give myself away, and I am not going to do so now, for I am taking refuge in numbers and describing several. Then "you pays your money and you takes your choice."

Opera is a white-perianth daffodil of almost faultless form, substance and symmetry, but it might be considered too much on the small side by those who burn incense before the great god Size, for its diameter is but 2½ins., which is a poor measurement compared to that of the massive Jessie, which is the next flower on my list. "The light of the body is the eye." The light of Opera is

its lovely eye of green and yellow margined with a sharply defined edge of Will Scarlet red.

"Have you seen old Mallender's Jessie?" was one of the first remarks addressed to me on my arrival on the evening before the Show. I accordingly expected something out of the ordinary, and I was not disappointed when I saw the flower in the flesh. It is an immense flower with a diameter of about 4½ ins. to 5 ins. and with a pure white, perfectly flat, well imbricated perianth surrounding a 1½ in. yellow cup margined by a divided and overlapping red edge. Its fault was that of Cassandra. The cup seemed hardly large enough for the size of its perianth. Otherwise it was "top hole."

Brimstone attracted many of us for the same reason that we all tumbled over each other to get hold of dear old Walter Ware's Queen of the West, viz., its colour. Not only can I remember those tantalising exhibits of this divine flower before (to use an old florist's term) it was "let out," but I can go much further back and call to mind Captain Nelson and John Nelson with their beautiful soft pale yellow colouring. The old brigade was wont to speak of a Nelson Yellow; but as this has no meaning, most likely, to our new recruits, may I explain that Brimstone is just a wee bit darker in shade than flowers of sulphur? It is a great bold bloom with a massive trumpet on the short side, and a slightly hooded perianth with pointed, overlapping segments and a diameter of well over 5 ins. If Brimstone's chief claim to distinction resides in its uncommon colouring, that of Royalist is its wonderful smoothness of texture combined with a flatness of surface that is extremely uncommon. I would have liked to have had Mr. P. D. Williams with us and to have heard what he would have said. Now my good friend Parson Bourne is no longer with us, there is no one whose opinion I value more than his. "Gladstone's up" and "P. D. has got some flowers" are parallel ejaculations. If in the one case the call was to hear, in the other it is to see. From all I heard at Birmingham and the testimony of two letters which were waiting for me on my return, I feel sure that had I been at London I would have had no more difficulty than the sharp Sunday School scholar had over the Crown of Glory in singling out the superb six blooms staged by "P. D." as the sight of the Show. Royalist is a medium yellow in colour, on the small side as modern trumpets go (e.g., Beersheba, Ben Alder and Bulwark), but of faultless form and proportion. Four varieties—Honey Boy, Tenedos, Alban and Opera—received awards of merit and one—Brimstone—since but three blooms were put before the Committee—had a preliminary award. I have already written about Brimstone and Opera. Naturally, readers will want to know something about what I think of the others. Tenedos I put first. It is a very fine Giant Leedsii of what I call the new starry type, in contradistinction to the old rounder shape of Lord Kitchener and Empire. It has a diameter of nearly 5½ ins. in well-grown specimens. Its segments have much substance and a very flat—non-fluted surface. It has a long cup which, after opening a pale primrose, becomes an ivory white. Mr. J. I. Richardson, whose first list of choice Daffodils for sale is before me as I write, has chosen it as a suitable illustration wherewith to puff his wares. Honey Boy—one of the many good things that Mr. Guy Wilson has given us—is a very gentlemanly looking flower. It is a yellow trumpet with a slightly hooded perianth and smooth, rather pointed segments which are inclined to incurve along their edges.

"He nothing common did, or mean,
Upon that memorable scene."

Alban is the last variety to be mentioned in my present pow-wow on the Midland Show, not that it exhausts either my notes or the good flowers that were there. Acting on a hint from our Editor, I have some more up my sleeve which I hope to talk about before very long. To go back, however, Alban is, like Tenedos, a Giant Leedsii, but of a

totally different aspect. The flowers droop slightly. The corona is more of a bowl shape than we usually find in this class. As exhibited the whole is very white, and the general appearance striking and massive. I know many other visitors were as much struck with it as I was myself.

JOSEPH JACOB.

RHODODENDRONS AND AURICULAS AT VINCENT SQUARE

BESIDES the customary Show of the R.H.S. on April 24 and 25, it was the occasion of the Annual Shows of the Southern Section of the National Primula and Auricula Society and of the Rhododendron Society. Many of the Rhododendrons were exceedingly beautiful, though quite a number of the varieties were suitable only for the mildest parts of the country. Mr. T. H. Lowinsky sent some of his large pot plants in full bloom, but as they were submitted to the Floral Committee, the general visitor did not have an opportunity of admiring their grace and beauty. The principal Rhododendron exhibitors in the hall itself were Lady Aberconway, Sir John Ramsden, Colonel Stephenson Clarke, Lieutenant-Colonel Messel, Mr. L. de Rothschild, Mr. G. L. E. Loder and Mr. E. J. P. Magor. The great majority of their blooms were hybrids of Aucklandii, Thomsoni, arboreum and campanulatum, and they were of singular charm and beauty in the size of the individual flowers and their rich or delicate colouring. Quite a number of the rare little species were included in the collections, and of these it was the blue-flowered varieties that seemed to attract most attention. These varied in size from the tiny dark blue *R. rupicolum*, the slightly larger and paler *R. intricatum*, *R. hippophaioides* and *R. fastigiatum*, to the larger (but still small for the genus *R.* *Benthamianum* and *R. Augustinii*. But showiest among all the blue Rhododendrons was the branch of

R. campanulatum hybrid in the group by Messrs. R. Gill and Sons. This was a delightful spray, and in Mr. L. de Rothschild's collection there was a nearly similar hybrid, though a trifle paler in colour.

The Auricula Show was quite a small affair, and this section of the Auricula Society seems to be dwindling away. In the open classes Mr. James Douglas was almost the only exhibitor, and was awarded all the available first prizes. In the few amateurs' classes Mrs. Groves won a couple of first prizes, and there was an occasional second and third prize. The object of the classes was left to the imagination of the visitor, as the information vouchsafed on the entry cards was of a meagre description. Mr. Douglas' Show Auriculas included excellent plants of Petite, Curious, Pink Ground and Mrs. Groves, an uncommon buff-yellow with a well defined white eye, which was the premier Fancy in the Show. His Alpine premier was Annie Roxburgh, and other noteworthy plants of this type were Rosy Morn, Prince of Tyre, Admiration, Black Self and Argus. It was fully evident from the greater proportion of this type which Mr. Douglas so well arranged in his non-competitive collection and from the remarks of the visitors, that the more easily-grown Alpines are much more popular than the Show varieties.

In the classes for Primroses and Polyanthus Mr. G. W. Miller was practically the only exhibitor, and was awarded all the first prizes. His single

GLISTENING BLOSSOMS AND DISTINCTIVE FOLIAGE OF RHODODENDRON BULLATUM, FARRER'S VARIETY.

Primroses included splendid plants of Jack (a large white), Blue Bird and The Bruce (a deep crimson bloom). Among the magnificent Polyanthus the orange-coloured Wallace was pre-eminent.

Daffodils were still in great beauty, though not in such variety as at previous shows. The falling off was chiefly in the brilliant Barri and the large Trumpets. Poeticus varieties were, naturally at this season, shewn in great numbers and of considerable excellence. Messrs. Barr and Sons had lovely blooms of Comus, Caesar, Socrates, Glory of Lisse and Epic. Messrs. Sutton and Sons had many in their decorative group, where also the chaste, pale-eyed St. Olaf, Hera and Queen of the North were conspicuously beautiful. Messrs. Barr also had in a goodly collection some Darwin Tulips of uncommon lavender shades of colour which fascinated many visitors. The large collection of Tulips so well arranged by Messrs. R. H. Bath, Limited, provided glowing masses of colour. Of the pink sorts Sarah Bernhardt, Ibis and Fabiola, with Artus, Couleur Cardinal and Le Grandeur, of the deeper shades of colour, were delightful.

Although the Spring Show of Roses was held so recently, Messrs. B. R. Cant and Sons, Mr. Elisha J. Hicks, Messrs. Paul, Limited, and Messrs. William Cutbush and Sons were able to make very attractive displays, and the chief Carnation people also set up their customary collections of fresh and fragrant blooms. The most noteworthy of the indoor exhibits was probably the collection of winter-flowering Sweet Peas shewn by Mr. J. D. Botterill of Colne Park. He sent excellent vases of Sunrise (pink), Winter Blush, Christmas King (white), Cantab (blue-lavender) and Yuletide (deep pink).

Among the collections of general shrubs were flowering sprays of Cornus Nuttallii, Drimys Winteri, and Ceanothus thyrsiflorus in Messrs. Cheal's group; hardy Rhododendrons and Daphne Cneorum in splendid quantities by Messrs. Wallace and Co.; excellent standard Brooms, Cherries and Lilacs shewn by Mr. R. C. Notcutt; and Magnolias, Berberis in variety and Ceanothus rigidus shewn by Messrs. Waterer, Sons and Crisp. The handsome, purplish young leaves of Photinia serrulata were very showy in the stand of Messrs. Hillier and Sons, who also had a plant of the rare Cotoneaster horizontalis variegata.

Messrs. G. Bunyard and Co. had several small plants of the beautiful double pink flowers of Pæonia Moutan Elizabeth, and displayed early fibrous rooted Irises, particularly Peter the Great, Snowcup and Zwanzburg. Gentiana acaulis in generous quantities and of glorious colour was shewn by Mr. Clarence Elliott and Mr. W. Wells, jun. The latter also had the yellow Gem montanum. Androsace sarmentosa primuloides in the stand of Messrs. Carter Page and Co., and Cardamine lilacina plena in the collection of Messrs. B. Ladhams, Limited, were very pretty.

NEW AND RARE PLANTS.

Anemone St. Brigid Crowley's White.—One is so accustomed to the bright and varied colours of the St. Brigid Anemones that at first sight this variety appears cold. But it is a good variety, fully equal in shape and substance to the others and, no doubt, will be useful for many purposes. Award of merit to Mr. S. Crowley.

Cerasus Hukon.—Although this is a very free-flowering species, it seems to be inferior, for garden purposes, to Cerasus serrulata luteo pleno. The fairly large abundant "semi-single" flowers are slightly pendulous and have a buff flush which gives a dirty white appearance. The

young foliage is purplish, but not so much so as in some other varieties. Award of merit to Mr. R. C. Notcutt.

Clematis macropetala.—A neat-habited climbing species belonging to Atragene section which seems to flower freely at an early stage of growth. The stems and flower-stalks are very wiry, and the foliage is small. The pale blue, double flowers are made up of pointed petals and, although not more than about 2 ins. long, are large in proportion to the growths and foliage. Award of merit to Messrs. Ingwersen and Jones.

Narcissus Intensity.—A shapely Poeticus Narcissus with a very white perianth and a small deep orange corona which is slightly darker at the margin. Award of merit to the Rev. G. H. Engleheart.

N. Mainsail.—A Poeticus Narcissus with very white perianth and a yellow corona which has a narrow, serrated rim of scarlet. Award of merit to the Rev. G. H. Engleheart.

N. Opera.—This fine Poeticus variety has a distinct eye of greenish yellow which merges to scarlet at the margin. Award of merit to Mr. W. B. Cranfield.

N. Roland.—A large Poeticus variety with pure white perianth and a broad green corona which merges to fiery orange at the serrated margin. Award of merit to the Rev. G. H. Engleheart.

Rhododendron bullatum Farrer's variety.—Quite a wonderful little plant was shewn. It was hardly more than 9 ins. high, and yet was crowned by a truss of large, substantial, widely expanded, short-stemmed, white flowers with light yellow flushed centres. The short, stout stalks are somewhat woolly, and are flushed with pink. The small, leathery leaves and the stem have a brown tomentum. The flowers are delicately fragrant. We question its hardiness, but it would be a delightful plant for the cool greenhouse. Award of merit to Mr. T. H. Lowinsky.

R. Euphrosyne.—A "hybrid seedling" which produces a good truss of large, widely expanded flowers of rich pink colour, that are lightly spotted with dull crimson towards the base. The handsome flowers quite hide the leaves. Award of merit to Mr. Lionel de Rothschild.

R. ficto-lacteam.—This Chinese species is one of the large-leaved Rhododendrons, and in many ways is suggestive of R. argenteum. The very large, deep green leaves have a brownish tomentum and are surmounted by a good compact truss of white flowers. Award of merit to Mr. G. Reuthe.

R. Gilian.—This is a very richly coloured hybrid, probably between campylocarpum and Aucklandii, which bears quite a good truss of drooping, trumpet-shaped flowers of dusky cardinal

colour. The uncommon roundish calyx and the stalks have the same colour as the outsides of the flowers. The interiors are very bright. Award of merit to Mr. E. J. P. Magor.

Rhododendron Penjerick.—The pink campanulate flowers of this variety are delicately

THE NEW SOFT BLUE ATRAGENE CLEMATIS MACROPETALA.

veined with deeper pink and have a recurving rim. The truss is loosely formed and the leaves are deep green above and pale green beneath. Award of merit to Lady Aberconway.

Trillium undulatum.—A very pretty and uncommon American Wood Lily. The flowers have a crimson lake base and the trifoliate leaves are flushed with purple. Award of merit to Messrs. Waterer, Sons and Crisp.

Tulipa Tubergeniana.—There was a good vase of this exceedingly showy dwarf Tulip. During the morning the large flowers opened widely disclosing to the full their gorgeous scarlet colouring. Shewn by Mr. W. R. Dykes.

Brasso-Cattleya Apollo var. majestica.—A splendid flower. The sepals and petals are a sparkling mauve bluish, and the large, widely expanded lip is prettily fringed, lined with rosy mauve and has a golden yellow centre. Award of merit to Messrs. Cowan, Limited.

Odontoglossum Fabia var. Biddy.—A stout, erect spike well furnished with large, shapely flowers which are regularly spotted with chocolate. About rim of the lip is tipped with white. Award of merit to Mr. C. J. Lucas.

In our report of New Plants at the London Daffodil Show we, by inadvertence, attributed Narcissus Dainty Maid to Mr. W. A. Watts. This was raised and exhibited by Messrs. R. H. Bath, Ltd., of Wisbech, and to them the A.M. was given.

CORRESPONDENCE

DIANTHUS NAPOLEON III.

HOW scarce this fine old hybrid Pink has become! I am without it myself just now, and it figures in but few catalogues of the present day. It is an old favourite which was even more appreciated in bygone years, largely, perhaps, for the reason that, although there were many lovely Pinks of other classes in those days, there was really less variety in the race than we have now. There were a fair number of hybrids, or "Mule Pinks" as they are still called, but Napoleon III seemed to be the most select of its kind. Only about 6 ins. high, with stems bearing numerous double deep crimson flowers, and of superb habit and appearance, it came first in the estimation of many of the old florists. It is not difficult, however, to diagnose the cause of its scarcity nowadays. It makes but little grass and exhausts itself by tree flowering, and this means regular propagation by cuttings of the side shoots, which are not freely produced except in plants prepared for the purpose. This means a little self-sacrifice, as it is desirable to cut down a plant to near the base before the flower-stem has grown much, so as to induce it to throw out side growths, which may be struck under a bell-glass, hand-light or frame in very sandy soil. It will be a pity if such a good plant should ever be lost to cultivation, but I fear this is not improbable, unless a few more are induced to add it to their gardens and so to encourage the trade growers, who cannot afford to propagate and stock plants for which there is little or no demand. —S. ARNOTT.

ABOUT FREESIAS AND NORTH BORDERS.

MR. JACOB'S Freesia notes on page 169 open with the question of "duds." I wrote to him and also mentioned in THE GARDEN, March 17, page 137, that I had got the better of the trouble and without having to resort to the hot water cupboard. No; he did *not* get any duds from me. As to his remarks on the yellow varieties, Golden King and Goldfinch I know have small tubular flowers, but for colour they are the best in commerce, and for cut flowers they have been given a very high character by one of the biggest florists in London. Daffodil, with me, is certainly bright yellow with an orange lip. But Apogee, Buttercup, Daffodil and Treasure, though not very distinct in colour are very distinct in size, shape, habit and season, and if room permits I would grow all four varieties. I gather that Mr. Jacob's idea of yellow is what I, and I think most people, call orange, for I have a few blooms sent to me by him to shew the colour, and they are, to my mind, rich orange. They are of very good size and shape, very rich colour, and a wonderfully strong scent, but not *yellow*, Mr. Jacob, surely! If I had the same quantity of any of those he sent as I have of Golden King or Goldfinch, I should certainly discard them both, but I imagine Mr. Jacob has not many as yet.

"Breaking."—Conquest, which is mentioned, has so far kept its colour. Rosa Bonheur I find too weak in the stem. Bartley Rose I am discarding. I have better varieties than this now. I find in pinks and similar colours that all the richest colours appear on the smallest flowers. Large flowers do not seem to carry nearly so much colour. All manvies, lavenders, blues, pinks and roses seem to be much more liable to break than the yellows; in fact, I do not think I have seen a broken yellow, and in my opinion "breaking" spoils 99 per cent. of the varieties.

I read with pleasure Mr. Jacob's notes on bulbs, page 187, and heartily agree with him on his opinion of Crocus Maximilian. I think it is the best of all. And on page 186, "A Successful North Border." I have tried the planting in a cool, shady position of hardy Cyclamens, spring and autumn varieties, with Anemone nemorosa blue varieties, as Mr. Hadden has done. Anemone Alleni is, I think, the finest. A. blue Bonnet is quite the latest. A. cornubiensis is good and the first to open. AA. Celestial and Royal Blue are very bright, but not so large as the others. Mr. Hadden has not tried these last, I presume, nor A. Robinsoniana, which is paler, but a very good doer and increases quickly. As the lawyers advertise, if Mr. Hadden will communicate with me, he may hear of something to his advantage.—G. H. DALRYMPLE, Botley, near Southampton.

THE MEDITERRANEAN CRESS.

WHEREVER anything like a collection of alpinists are grown there is always something in flower to attract the eye, and during April and often in May the very charming Morisia hypogæa

THE MEDITERRANEAN CRESS, MORISIA HYPOGÆA.

is in full bloom. It is said to have first flowered in Britain in 1834, but it is still not too common in gardens. It hails from the mountains of Sardinia. A cruciferous plant, it is sometimes called Mediterranean Cress, and the foliage certainly somewhat resembles the Cress known in gardens. The whole plant does not exceed 3 ins. in height, and it forms small, flat tufts of glossy leaves 2½ ins. in length, and the bright clear yellow flowers, borne singly on short stems, are about 1 in. across. The blooms rise just above the foliage, and a healthy plant with upwards of sixty flowers open at one time is most attractive. This choice little alpine is quite hardy, and it will succeed if planted in well drained, deep sandy loam with a liberal sprinkling of grit. A south aspect on the rock garden is preferred, and although it enjoys plenty of sunshine, it will not thrive if given a

dry, hot position where it is roasted with the sun. M. hypogæa can be increased by careful division and from seeds. It is said to bury its seed-pods in the soil, and, in my case, a number of seedlings have appeared near the old plants. The seedlings are approaching flowering size, and will be very welcome. This year I shall watch for the seed-pods and try to raise this choice alpine in quantity. —T. W. B.

EARLY-FLOWERING SAXIFRAGES IN THE ALPINE HOUSE.

ALTHOUGH most alpinists thrive well if treated according to their special requirements in the alpine or cool greenhouse, not all of them flower so freely as they would in their more natural homes on the rockery, and this is true in many cases as regards the early-flowering Saxifrages, most of which are of Burseriana type. Saxifraga Burseriana and S. B. crenata are both well worth growing, especially crenata, as it is one of the first to open its blossoms. The white flowers are displayed just above the greyish green rosettes of leaves, which by the time the plant is in full blossom are practically hidden. S. Burseriana Gloria in my experience does better on the rockery, although in some districts it might delight its owner with a wealth of glorious flowers inside.

In any case, it is well worth trying for a season. S. apiculata and S. a. alba are both good flowers, but preference should be given to the type, because there are really sufficient white species and varieties of much better quality for inside work. S. Elizabethæ is another good yellow, but S. Haagei is, in my opinion, the best of the yellows; it is such a good deep colour and the shape of the flowers is so distinct. A real gem among early-flowering Saxifrages is S. Irvingii, which should be in every alpine house. The pink colouring makes a vast difference to the appearance of the flowers, which are produced quite profusely and last for a considerable period, especially if care is taken when using the watering-can. Of the oppositifolia section, oppositifolia alba and o. major are my favourites, especially major because of the colour. Red flowers are

very rare in late winter or early spring, and this variety produces them quite freely on good-sized plants. SS. Paulina, Petraschii and Salomonii are, I think, best outside, especially the last named, which only produces a flower or two inside and those very small compared with some on a plant which flowered on the rockery. Another plant well worth mentioning and certainly well worth growing is *Morisia hypogæa*. At the time of writing it is flowering profusely for the third time, and there is yet another succession of buds appearing to prolong the glorious display which has lasted for quite three weeks. — R. C. JOLLIFFE, *Oxford*.

GLADIOLI: NOTES AND NOTIONS.

IS it not a fact that most folk who grow Gladioli lift the corms in late autumn to plant them again in spring? Do not most of us look upon them as too tender—and in the case of some, at least—too expensive to leave in the ground all winter? I ask these questions because in April I saw several groups of the old scarlet *breuchleyensis*, well above ground, that had been left, inadvertently, last October, and seemed none the worse for having remained in the soil. Mentioning the matter to a friend who is interested in Gladioli, he told me that he does not lift his corms every year as, owing to his light, well drained soil, there is no necessity so to do. Personally, I should not care to run such a risk, especially with some of my varieties, which include White Giant, Maréchal Foch, L'Immaculé, Pink Beauty, Mrs. Francis King and Corri; moreover, by lifting corms, one is able to plant in spring in succession and so have flowers over a much longer period. Has any reader ventured to leave corms in the ground throughout the winter, and if so, would he report his experience? Is *breuchleyensis*, probably the oldest known variety of *Gladiolus*, hardier than others? It would almost appear so, yet I have been brought up with the idea that it is unwise to take risks with any varieties, just in the same way that it is safest to lift for the winter and store bulbs of the Cape Hyacinth, *Galtonia candicans*. — W. LINDERS LEA.

[We have had no really testing winters for a long period, but there is little doubt but that the *primulinus* hybrids are the hardiest of all the sorts in commerce, hardier even than the *Colvillei* section, which must be planted in autumn. — ED.]

DIANTHUS CÆSIUS AND MICE.

AS you state in your issue for April 21 that the views of readers on the above point would be of interest, I venture to send you my experience in two different localities. On more than one occasion my rock garden has suffered severely from the raids of field mice during the late autumn and winter. Indeed, on one occasion when I had just completed the planting of a new rock garden, covering an area of about 50 sq. ft., not only was there hardly a plant out of a large collection that the mice did not eat down to the ground (mercifully they went no lower!). They made the rock garden their headquarters for several months; but on no occasion have I found either *Dianthus cæsius* or any of my other small Pinks touched. The plant especially enjoyed was *Gypsophila repens*, and in this case

the mice went well into the roots of every one that they could find. — F. W. LACE, *Hever, Kent*.

FASCIATION.

I ENCLOSE a rather curious fasciated inflorescence of an Empress Daffodil. You will notice that there is a curiously formed "leaf" running

THE FASCIATED DAFFODIL.

down the stem, as well as the double flower, or really more than double, as one flower has eight petals. I know you occasionally have drawings of these flowers and hope this may be worthy of such fame. — (Mrs.) A. C. CHARRINGTON.

[The large flower, which had a fasciated pistil, had ten complete perianth segments and another partially formed adherent to the trumpet, which was split from top to bottom and partially overlapped itself. — ED.]

KALE AND "CLUB."

IS Kale immune from the disease of club root, or is it less susceptible to it than other Winter Greens? My own experience prompts me to say that it is practically exempt from the scourge. A few weeks ago my attention was drawn to a quarter of Brussels Sprouts which had failed because of their having been attacked, yet only a few yards away was a flat of A 1 and Asparagus Kale in the best of condition, which were not affected in the least. Most of the Asparagus Kale had been raised—not from seed as is the general practice—but from cuttings and the theory advanced as to their immunity from club root was that the cuttings were too tough for the disease to become established. I have certainly seen Kale growing on land which had previously been occupied with an "affected" crop, and shewing no signs of disease, but I question the wisdom of ground devoted to any of the Brassicæ one year being occupied by Kale the year following. — CLAREMONT.

[If Kale is immune to attack by club root, a proposition which needs clearing up! it is certainly anything but immune to the cabbage gall weevil, which is often mistaken for "club." — ED.]

SPRAY YOUR ROSES

THE pruning knife and the secateurs have been busy among the Roses, and many an ardent young rosarian is patting himself on the back for having been courageous enough to cut away strong, vigorous-looking branches to the third prominent and outward pointing bud a few inches from the base. So far, so good; "prune hard for quality" is sound doctrine. There is, however, another matter that should demand attention, but which, alas! is all too often postponed until visible signs impress upon the grower that something is wrong, and then what might have been a simple task proves to be laborious and only moderately successful. The matter referred to is that of taking preventive measures against diseases and insect pests.

It is somewhat strange that, with all our knowledge of the life-history of the fungoid diseases and insect pests that ravage our Roses, the error is still common of waiting until damage is visible before an onslaught is made upon the enemy. In this respect fruit growers, except for a small proportion of obstinate sceptics who refuse to believe in spraying, have seemingly advanced at a more rapid pace than the rosarians, and we have become familiar with the use of caustic winter washes for fruit trees as well as the lime-sulphur, arsenate of lead and various other fruit sprays of early spring and summer.

My contention is that the rosarian has equal need of winter and early spring sprays, and that reliance upon the soft soap and quassia, petroleum emulsion and summer washes in general is almost equivalent to leaning upon a bruised reed, because by the time these remedies are applied many of the foes we would fight are securely entrenched beyond the reach of our weapons and ammunition.

The present is the period of reawakening of our enemies. Let us consider for a moment what this means. A fungoid disease, whether it be common mildew, downy mildew, black spot or the fungus known as rose leaf scorch, goes through a three-stage metamorphosis, the spore or unit of growth, the developed parasitical growth, and the pustule or fruit which is a bag or bladder filled with spores which under favourable conditions will burst, liberating the spores to fulfil their purpose of reproduction. The pustules and spores are produced outside the plant, but the spore, immediately it breaks into activity, sends out a minute thread that finds its way through the pores of the foliage into the inner tissues of the leaf or young bark, and there the parasite spreads in a position that cannot be assailed by chemicals without damage to the plant. Obviously the opportunity to gain mastery over a fungoid disease is while the spores are still outside the plant. A fungus fruits at intervals during the summer, consequently by spraying with suitable washes at frequent intervals during summer we may check the progress of disease by destroying the newly ripened spores before they have opportunity to develop. There are, however, also winter forms of pustules or fruit bags which remain dormant during winter and release their spores when conditions are favourable in spring. Thus it happens that young, healthy shoot may become covered with spores so minute as to be invisible, which will remain dormant until the correct balance of temperature and moisture enables them to burst into activity. Fortunately, there are chemicals which, if properly applied so as to form a thin film over every part of a plant, will prevent the spores from gaining access to the tissues of the young growths.

Sulphide of potassium is an excellent and safe fungicide, the only disadvantages being an evil

smell, rendering the spray obnoxious for use near a dwelling-house, and the fact that it discolours white paint, and must therefore be used with caution in or near glasshouses or other painted woodwork.

To prepare a suitable potassium sulphide spray for Roses rib, of the chemical will make 30 gallons of wash. First boil the sulphide in half a gallon of water, using an enamelled pan for the purpose. When the chemical is completely dissolved stir into a tub containing 30 gallons of wash. It will be wise to boil the sulphide in an outhouse or somewhere removed from the dwelling-house because of the vile smell.

A copper or tinned spraying machine should be used, and a fine spray nozzle is necessary in order that the fluid may be distributed in a fine vapour like spray to cover completely every particle of the plant. Much may also be written to shew the wisdom of early spraying as a deterrent to insect pests.

The first batches of rose aphid or green fly hatch out very early if we get a day or two of warm spring sunshine from eggs laid by the oviparous females of last autumn. These eggs

are laid on the undersides of the stems, in the cracks of the old bark, among the lichen or mossy growth on the trunks of old standard Roses, or in any harbour conveniently situated for the young brood to gain access to the tender, succulent shoots of the Roses.

Many excellent proprietary insecticides are available which require no more preparation than dilution according to the directions supplied with the goods, but the great power of nicotine prompts me to recommend that either a nicotine spray should be used or that a few drops of pure nicotine should be added to each gallon of other spray fluids. With nicotine we may combat caterpillars, the frog hopper and rose leaf hopper, the stem maggot and other gnawing insects, but the great thing is to spray early rather than wait until the pests are numerous and have already done much damage. One other point is that it is infinitely better to spray twice within a short period with a wash of moderate strength than to endeavour to make a drastic onslaught by using greater strength of chemicals. The latter may prove to be harmful to the tender young growth.

A. J. MACSELF.

GARDENING OF THE WEEK

FOR SOUTHERN GARDENS.

Fruit Under Glass.

Vines.—In some gardens, especially where a lot of fire-heat is not used, the Vines will be in bloom, and if Muscat Grapes are grown, it should be borne in mind that they do not set their fruit freely if left to themselves. In addition to tapping the rods with the hand about midday, the bunches may be gone over lightly with a rabbit's tail. A circulation of air is necessary, and during the time the Vines are in bloom the atmosphere should be kept on the dry side. A night temperature of 65° should be maintained, and by midday it can rise to 85° or 90° with sun-heat, and no harm will accrue. When the berries have set, the house should be closed early in the afternoon, and the floors and walls sprinkled with water to create a moist atmosphere. Ventilation will need attention, and a little top air must be admitted sufficiently early to prevent the foliage from scorching. The front or bottom ventilators need not be used at this stage. The thinning of the berries ought not to be proceeded with until it can be ascertained which berries have been properly pollinated, i.e., contain stones.

The Hardy Fruit Garden.

Vines in the Open.—Occasionally these are found growing in the open on a south wall, but it is only at rare intervals that the fruit develops sufficiently to be of any use. Now is the time to disbud. First remove the weakest shoots and finally reduce the number to one on each spur. The growths should be pinched two or three leaves beyond the bunch and the laterals at the first leaf. Red spider is sometimes troublesome, but if the roots are kept moist it is less likely to appear. Mildew is often present, but Bordeaux mixture or flowers of sulphur sprinkled over the foliage will keep it in check.

Newly-Planted Trees. Apples, Pears, Plums, etc., that have been planted rather late in the season must be watched carefully if the weather proves dry, and particularly if we experience anything like a drought. The surface soil should be lightly pricked over and a good soaking of water afforded, afterwards giving a liberal mulch of partly decayed manure. The stakes and ties must also be made secure. A heavy syringing with clear water late in the afternoon will benefit transplanted trees considerably.

Grafted Trees.—If any grafting has been done this season, it will be necessary to examine the grafts at intervals to ascertain if the surrounding clay is still in good condition. Dry winds will cause it to crack, when it should be made moist and the cracks filled by rubbing the hand several times around the clay.

The Flower Garden.

Roses.—The rose garden and borders should be hoed occasionally to keep down weeds and to aerate the soil. Briar suckers will also appear

Instead of cutting these off with the hoe, they should be traced to their base and removed quite close to the main root.

Propagation.—May is a busy month in the flower garden, and preparations must be made for filling the beds next autumn. Many plants are increased by division, such as Arabis, Polyanthus and Violas, and they should be planted in lines 1 ft. apart in the reserve garden.

Wallflowers.—Although it is often recommended to sow seed of these as late as July, I always prefer to sow during the present month. The seed should be sown in lines 6 ins. apart, and if the soil is dry the drills may be well watered a few hours previous to sowing. When the seedlings are large enough to handle, they should be transplanted 1 ft. apart and the centre of the plant pinched out; no further stopping is required. We generally give these plants a good position for the summer, usually where the early crop of Potatoes has been removed. Keep them free of weeds and by frequently using the hoe fine sturdy specimens will be available for the beds and borders next autumn. For early flowering Yellow Phoenix should be chosen; this has been more or less in flower throughout the winter and spring; while for a general display Fire King, Blood Red, Cloth of Gold and Orange Bedder are to be recommended.

The Kitchen Garden.

Potatoes.—Complete the planting of the main crop varieties, and where the earlies are pushing through the soil a little earth should be drawn around the shoots to protect them from frosts. A few evergreen branches will suffice for those further advanced in growth.

Marrows. Make another sowing of Vegetable Marrows and place the pots in a cool greenhouse, gradually hardening them off when germination is effected. Seeds may also be sown in the open ground where the plants are intended to fruit, but it sown now a hand-light ought to be put over the spot where the seed is sown.

Broad Beans.—A small sowing may be made for a late crop, but on hot, sandy soils it should not be attempted. Where the soil is heavy and of a retentive nature and the season proves cool and moist they will succeed.

Parsley.—The bed that has passed through the winter will need the old decayed leaves and flowering-stems removed, and plants from an early sowing should be thinned to 6 ins. Another sowing may now be made.

Sage.—Where the plants are getting old, cuttings should be inserted eventually to take their place. A partially shaded position should be chosen, and the cuttings set out in lines 18 ins. apart.

Brussels Sprouts. If plants were raised early, they will now be ready to transfer to their final quarters. Plant them in rows 30 ins. apart and

about 2 ft. between the plants. They enjoy a rich soil, and must be kept moist at the base until the roots are established.

T. W. BRISCOE
(Gardener to W. R. Lysaght, Esq.),
Castleford, Chepstow, Gloucestershire.

FOR NORTHERN GARDENS.

The Kitchen Garden.

Turnips.—The main crop of Swedes should now be sown, also a fair breadth of Golden Ball, with another small sowing of Extra Early Milan to succeed the April-sown batch. The distances between these kinds, respectively, should be 21 ins., 18 ins. and 15 ins.

Kidney Beans.—A sowing of a quick-maturing variety, such as Ne Plus Ultra, may now safely be made on a south border. A compact variety like the above mentioned will have sufficient space if sown in lines 15 ins. apart with 6 ins. between the seeds.

Runner Beans.—The full crop of these should be sown within the next ten days. Germination is made more sure if the seeds of both Dwarf and Runner Beans are soaked in water six or eight hours immediately prior to being sown.

Early Potatoes.—Slacken the soil between the drills with the aid of a fork preparatory to earthing up the crop.

Brussels Sprouts that were raised under glass in early spring and have been pricked out in a frame should now be planted in rather firm soil in lines 2 ft. apart, allowing 1½ ft. between the plants in the line.

The Flower Garden.

Chrysanthemums.—These popular autumn flowers should be planted out with as little delay as possible, it being understood that the ground has been duly prepared for their reception. If they are to be fitted into a scheme, it will be advisable to reserve a proportion of the stock for furnishing cut flowers, planting them in a less prominent position, even in the kitchen garden if need be. If they are to be planted from boxes, an effort should be made to lift each plant with as much soil adhering to the roots as possible.

Half-Hardy Annuals.—The hardier members of this class may now be planted out. These will include Stocks, Asters, Marigolds, Sunflowers and Lavateras, and the tall Larkspurs if they have been raised under glass.

Herbaceous Plants.—The more precocious of these will now demand staking and tying. The character of the stakes must vary with the character of the plants, from the stoutness of a dahlia stake down to a slender cane or twiggy branchlet. For the more vigorous plants nothing equals binder twine, being soft and of sufficient strength; for the lighter plants raffia is unexcelled. Beware of tying too tightly.

Fruits Under Glass.

Late Vines that were started early in February will be shewing flower within the next week or so, when a rather dry and buoyant atmosphere should be maintained to facilitate the proper dispersion of the pollen, and in order further to ensure the process of impollination, each rod should be sharply tapped daily about midday until the fruit is set. Under these conditions it is all the more necessary to see that the Vines do not suffer from lack of moisture at the root.

Figs.—Trees that were started early will now be making wood quickly, and any surplus shoots should be cut away, and those retained should be tied into position as growth advances. The first crop of fruits will be swelling towards full size, so that close attention should be given to the state of the roots, for if the plants are allowed to suffer from lack of water it will mean badly finished fruit with every likelihood of a portion of the crop dropping off. Trees in pots demand still closer attention as to watering, and they should receive assistance by occasional applications of weak liquid manure until the fruits commence to ripen, when drier conditions should prevail.

Melons.—The fruits of the early batch will now be swelling quickly, therefore the plants will require abundant moisture at the roots with bi-weekly applications of weak liquid manure. Keep a watch for red spider, and if it appears, syringe the plants twice daily; but if the pathways and walls are damped twice daily there is little danger of this pest appearing, and syringing of the plants should then be unnecessary.

GREENHOUSE AND CONSERVATORY.

Fuchsias raised from cuttings inserted last September should now be well grown plants some 2ft. or more in height and ready for their flowering pots, which may be 7ins. or 8ins. in size, according to the strength of the plants. These plants enjoy a rich compost, which should consist of three parts good turfy loam, with the addition of some leaf-soil, or old Mushroom bed manure and sand, adding a bin. potful of bone meal to every bushel of soil. They enjoy liberal feeding, with guano, soot and liquid manure, when the pots are well filled with roots. To get well furnished plants the side shoots should be stopped, up to about a month before they are required for flowering. Such plants, if kept well fed, will last in flower for a long time and are very useful for furnishing the conservatory during the summer months. Younger plants, rooted early in the current year and grown on in the same way, will make a useful succession for late summer and autumn flowering. Where it is desired to grow them as standards, all side shoots should be rubbed out until the desired length of stem is reached, when the tip of the leading shoot should be pinched, afterwards stopping the laterals frequently to form a good foundation for the future head of the plants. Fuchsias grown in this way last year and started into growth early this year, with frequent stopping have now made good heads and may be allowed to flower in about a month's time.

Primulas.—Where successional batches of the *suensis* type are required, seed may now be sown, followed later on by other sowings, according to requirements. For decorative purposes the stellata varieties are most suitable, not only for their light elegant effect, but also for their length and freedom of flowering. The variety Coral Pink and the "blue" varieties make a very effective colour combination, as also do the red and white varieties. The seed should be sown in a light, rich compost, and may be germinated in slight warmth. Germination is generally very irregular, thus the seed pots should not be discarded too soon. During the summer months the young plants should be grown in low pits or cold frames. The plants should be watered carefully at all times and kept shaded during the hottest part of the day. They enjoy a light, rich compost to which some old mortar rubble should be added. By growing them on a second year very fine specimens can be obtained, and for this purpose plants should be selected from a sowing made rather late last year. A bunch of stellata varieties grown in this way has been in flower for close on six months in the conservatory at Kew, and at the time of writing are still a mass of flower.

Cinerarias.—Where it is desired to have these plants in flower towards the end of the year, a pinch of seed should now be sown. For decorative work, preference should be given to the intermediate types, of which many good selections can now be obtained. Some of the blue strains are very fine and worthy of more general cultivation. The seed should be sown in a light, rich compost and germinated in a cool house, as cool conditions at all times are essential for the successful cultivation of Cinerarias. During the summer they are best grown in cold frames or in low unheated pits. They are very subject to attacks by green fly, which should be prevented by frequent light fumigations.

Aster fruticosus.—This shrubby species is a native of South Africa, and is worthy of more general cultivation for the cool greenhouse. It makes a neat, bushy specimen some 2ft. in height and produces its starry blue flowers in great profusion during April and May. Good examples can be grown in 6in. or 7in. pots. This plant is easily propagated at this time by means of young shoots, inserted in pots of sandy soil and stood under a bell glass in a cool greenhouse.

Auriculas.—Cold frames or a small unheated house are necessary for the successful cultivation of Auriculas. Good named varieties are rather expensive, but good results can be obtained by raising them from seed, which may be sown any time during spring or early summer. From seed it takes about eighteen months to grow them on to flowering size. Old plants should be repotted every year, the best time being when they have finished flowering. They should be shaken out and a portion of the old root stock cut away to allow them to be potted down to the bottom leaves. This is important, as they throw out fresh roots from the upper part of the stem. Before repotting, the roots should be cleansed of woolly aphids. After repotting, stand in cold frames and water carefully until the roots get a hold of the fresh compost.

Royal Botanic Gardens, Kew. J. COULTS.

Awards of the Dutch Bulb-growers' Society

THE Dutch Bulb-growers' Society of Haarlem has made the following awards:

FIRST-CLASS CERTIFICATES.

Franshis Tubergenii, soft yellow, very large flowers, a cross between *E. cilicica* and *E. hyemalis*.

Narcissi:

Ducon City (Ajax), uniform dark yellow with a long, somewhat notched trumpet and wide, well shaped petals.

Golden Harvest (Ajax), self-coloured dark yellow.

Red Cross (Incomparabilis), soft yellow perianth of good shape, with large dark yellow cup, bordered orange, very strong grower.

Eten (Poeticus), pure white well shaped perianth with orange red cup.

AWARDS OF MERIT.

Narcissi:

Gertruida Carlsen (Ajax), uniform golden yellow with widely opened, very much notched, shapely trumpet.

Golden Giant (Ajax), self-coloured clear golden yellow perianth, regularly formed, trumpet large and fantastically notched.

Hortulanus E. Th. Witte (Ajax), uniform golden yellow, widely opened trumpet.

Lord Wellington (Ajax), self-coloured dark yellow, very strong grower.

Eyebright (Barrin), pure white perianth of a good form, with orange-red cup, very large.

Lady Moore (Barrin), creamy-yellow perianth with citron yellow widely opened cup, bordered bright orange red.

Sanguine (Barrin), white well shaped perianth with uniform deep orange-red cup.

Pera (Barrin), shapely white perianth with small deep orange red cup.

La Fétale (bicolor), white perianth with very soft yellow trumpet, small flower.

Stromboli (double), petals sulphur yellow with vivid orange red.

Corinna (Incomparabilis), perianth white and shapely, cup soft yellow.

Bonne (Incomparabilis), perianth citron yellow, well shaped; cup deep orange red, large and frilled.

Orange Glow (Incomparabilis), perianth soft yellow, shading to white, with deeply notched cup bordered orange yellow.

Love-nest (Leedsii), white perianth, with creamy-yellow cup, passing at the edge to light apricot.

Mrs. R. O. Backhouse (Leedsii), perianth white, trumpet apricot rose.

White Wind (Leedsii), white perianth with small creamy yellow cup, somewhat frilled.

Aenophon (Poeticus), citron yellow perianth with large deep orange cup.

Cheerfulness (double Poeticus), perianth creamy white, crown double, white with citron yellow; strong stem, about five flowers on a stem.

We are also informed that the Certificate of the Haarlem Trial Garden has been awarded to *Double Blue Hyacinth President Grant*, dark violet blue.

FORTHCOMING EVENTS.

May 8.—Royal Horticultural Society's Fortnightly Meeting (two days).—National Tulip Society's Exhibition (two days), to be held in conjunction with the R.H.S.—Jersey Gardeners' Society's Meeting.

May 9.—East Anglian Horticultural Society's Meeting.

Rhododendron punctatum is a low-growing, spreading shrub with slender and elegant branches sparsely furnished with evergreen, elliptic leaves in a fresh, glossy green. It is admirable for the larger rock garden, the margins of shrubberies, or woodland banks over which it can trail, preferably in semi-shade. Almost any non-calcareous loam or peat will suit *R. punctatum* and, being a North American species, it is perfectly hardy. The flowers are borne in clusters at the ends of the branches in spring. Individually they are about 1in. across and of a lively rosy pink which is peculiarly effective against the bright green foliage. This species is sometimes listed as *R. minus*.

The Davidia.—*Davidia involucreata* is one of the most remarkable and striking trees of recent introduction and its story no less interesting than the unusual flowers and bracts for which it is valued. Happily it has proved to be hardy in England and it flowers freely owing to the fact that it ripens its wood so well in autumn. The growth somewhat resembles that of the *Lime*, with leaves 3ins. to 5ins. long, rather heart shaped at the base and drawn down to a long, fine point, while they are much toothed along the margin. From the buds of the previous year's shoots, the flowers are produced in May at the end of a drooping stalk. The actual flower is quite insignificant, consisting of no more than a tuft of brush-like stamens, but these are surrounded by two enormous white bracts, hooded, oblong and pointed in form, the lower one being by far the larger of the two. The upper bract stands over the flower like a canopy and the effect of a good plant covered with these immense white "butterflies" has to be seen to be fully appreciated. As the stamens fall, the surrounding bracts become greener and greener until they are scarcely to be distinguished from the leaves. Interest is not dead yet, however, for large, pear-shaped fruits soon begin to form and are ultimately covered with a purplish bloom. Now for the interesting story of the introduction of the tree to European gardens. A native of Central and Western China, it was named after its discoverer, the Abbé David, in 1860. A packet of seeds was sent to M. Maurice de Vilmorin in 1897 and one of these grew. Only as recently as 1902, Wilson sent thousands of ripe seeds home and it is from these that the plant has been distributed.

Answers to Correspondents

QUESTIONS AND ANSWERS.—All communications should be clearly and concisely written on one side of the paper only, and addressed to the EDITOR OF THE GARDEN, 20, Tavistock Street, Covent Garden, London, W.C.2. When more than one query is sent, each should be on a separate piece of paper. Plants for naming should be clearly numbered and securely packed in damp grass or moss, not cotton-wool, and flowering shoots, where possible, should be sent. It is useless to send small scraps that are not characteristic of the plant.

FLOWER GARDEN.

CROCUSES DISEASED (E. G. H.).—The Crocus corms are completely rotten and have made no roots. From their appearance we should suppose them to have been diseased when they were planted.

BENSONS (ESTABLISHED 60 YEARS)

Tottenham Court Road, London, W. (Oxford St. End)

This FREE Book tells you how to

Begin Beekeeping

This little Bee Book is written by experts in simple, non-technical fashion to tell beginners all about beekeeping as a profitable and pleasurable hobby.

It is plentifully pictured by photographs and sketches, and simply, clearly and concisely explains all that the beginner wants to know about bees and the modern hive. Published by Taylors of Welwyn, the largest apiarists in Europe, it is offered quite free to every reader who writes asking for it.

It will tell you the secrets of successful beekeeping, and how you can begin now at a small outlay in time for this season's honeyflow.

Write for your copy of the "Little Bee Book"—NOW.

The Blue-Green Face in Church

You see, on Saturday he painted the fence blue and the hen-run green, and he had never heard of KIT! So there was no help for it. The colour came off his hands on to his face. It wore away in a week, but . . .

It was pretty while it lasted.

KIT'S work in life is to clean the hands when ordinary soap is not strong enough. Grease and oil and paint and tar—those are the things KIT loves to move in the twinkling of an eye. Yet the after-feel is just the same as after the morning wash with toilet soap. None of the awful smell of "turps," or the soreness of pumice.

And the speed! KIT is the rub-and-a-wipe-and-it's-over-soap!

Price 6d. per Tin.

KIT the speed soap
is IT

KT. 5 50.

The "PERFECTOR" ARCH forms an ideal setting for the Rose Garden. The man whose pride is in his Garden will appreciate the simplicity and effectiveness of this design. The construction is light, yet strong enough for a permanency, being specially designed for the cultivation of climbing Roses, Clematis, etc. It is made entirely of OAK and treated with Solignum, size 7 ft. high above ground level, and 3 ft. 4 in. wide inside. Price £1 each. Orders for three or more will be sent Carriage Paid. Cash with order. These can be made wider than 3 ft. 4 in. if required, prices for which will be quoted on application, stating number required.

THE

"PERFECTOR" PERGOLA.

This is constructed with the above Arches spaced any distance up to 6 ft. apart. The longitudinal and secondary cross bars to complete the Pergola are supplied in OAK, treated with Solignum, at 1/6 per foot run of Pergola; any lengths to suit your requirements. Thus the price of the Pergola illustrated, 25 ft. long, works out as follows:—

4 Arches at £1 each	..	£4	0	0
25 ft. run Top Bar at 1/6	..	£1	17	6
CARRIAGE PAID	..	£5	17	6

Notes from Maidstone.

THE CALL of SPRING

At no time is the call of the garden more clamant than in those lengthening days when April turns to May. The weevil now leaves his watery nest and turns to seek his mate; the aphid, long immured in her dark egg, creeps out to fulfil urgent domestic calls.

But what is life to the weevil is death to the fruit & death's avenging hand may not be stayed.

Timely advice on such let'al matters is contained in our pamphlet on Pests of Orchard and Garden Crops—1d. post free.

[MAY 12, 1923.]

HARDY EVERGREENS

THE comparatively mild climate of the British Isles is peculiarly suitable for the development of evergreen trees and shrubs, and not a little of the world-famed beauty of our gardens and park-lands is due to this fact. Certain evergreens, more particularly conifers, thrive in very cold countries, but too often their foliage is very dark in colour and when seen in a dense mass has a depressing effect. We, however, do not suffer from that disadvantage, for our hardy evergreens have a very wide range of colour, from pale green to greens of bright and dark shades, with gold and silver variegation into the bargain. Moreover, many of our evergreens bear attractive flowers and beautiful berries.

Evergreens must not be planted indiscriminately about a garden, for nothing is more hideous than the continued repetition of three or four sorts of evergreens at regular intervals in shrubberies. To make the matter worse, such shrubs are sometimes clipped into quite close and compact balls or globes, and thus lose all their individuality. When a dozen shrubs in four different kinds are to be planted, it is usually far wiser to make four distinct groups of three plants each, than to allow each plant a separate position. Then specially attractive evergreens should be put into prominent places and those of greater vigour but less beauty may be used to block out undesirable objects, in places where choicer shrubs would have little chance of success. Variegated-leaved plants should be kept to the more formal parts of the garden, and not used where the garden breaks away into park or woodland. Even in the

garden proper, plants like the variegated Aucubas and Privets must not be used too freely, otherwise a spotty effect will be produced. The Aucuba is excellent for planting in shady places, but it can be overdone. Bamboos, again, are plants which can very easily be placed so that they ruin the landscape effect at a certain period of the year. From February to the end of June the natural decay of their foliage gives them a very untidy appearance, which is accentuated by the cold winds of spring. Their proper place is a garden to themselves, or if a few plants only are grown, a corner which is screened from the direct view of the house windows or other vantage points. Evergreens have a considerable value for clothing the ground beneath the branches of trees where grass will not grow. Perhaps the Ivy is the best of all plants for this purpose, but Euonymus radicans and its varieties are also useful. Where taller plants are required, the Common Holly, *Berberis Aquifolium*, *Rhododendron ponticum*,

Common Laurel and Oval-leaved Privet may be used. Among British evergreens the Common Holly (*Ilex Aquifolium*) is a very beautiful and useful tree or bush, whether growing in the garden or as a wilding in the woods. Its leaves are always bright and cheerful, and it is a first-rate fruiting tree. Neither do its virtues end with its leaves and berries, for it is happy almost anywhere, in sun or shade, in light or heavy soils, planted singly or in masses, as a specimen tree or a dense, closely-clipped hedge. Then it has produced so many varieties and hybrids that fifty or more kinds can be selected with quite distinct leaves or habit. The leaves may be prickly or smooth, broad or narrow, green or variegated with gold or silver. The variegations themselves sometimes occur in the centre of the leaves and are sometimes confined to the margin. Some are trees and others dwarf bushes. Some only bear male flowers and others only female. Some of the exotic Hollies, too, are very attractive. *I. Perado*, from the Canary

Islands, and *I. balearica*, a native of the Balearic Islands, intercrossed with each other and perhaps with the large-leaved *I. platyphylla* from Madeira, have produced a race of large-leaved hybrids, of which such kinds as *attaclarensis* and *Hodginsii* are worthy representatives. The American *I. opaca*, the Himalayan *I. diphyrena*, the Japanese *I. crenata* and the two Chinese kinds, *I. cornuta* and *I. Peryi*, are all worth growing as specimen bushes.

As companions of the Holly, the Yew and Box complete a trio of exceedingly useful native trees. All are very hardy and free-growing and are good for hedges, as they stand clipping

A GIANT COUSIN OF OUR NATIVE BEARBERRY—ARCTOSTAPHYLOS MANZANITA.

well. The Yew, however, is not suitable for massing on an extended scale on account of its sombre foliage. The British flora also contains good dwarf evergreen shrubs, such as the Common Juniper, the Red Whortleberry (*Vaccinium Vitis-idaea*), the Common Bearberry (*Arctostaphylos Uva-ursi*), the Crowberry (*Empetrum nigrum*) various Heaths and the Spurge Laurel (*Daphne Laureola*). Ivy is often found carpeting British woods and is the best of all evergreen climbers. For the milder parts of the country the exotic Heaths offer us a number of very beautiful flowering evergreens, some of which grow into fine bushes, 8ft. or 10ft. high.

Allied to the Heaths are the Rhododendrons, other one-flowered evergreens. They have one disad- vantage in winter, for a little frost causes the leaves to curl and they have a very woebegone appearance until a thaw sets in, when they soon regain their normal shape. The Arbutuses, again, are excellent evergreens, which form large bushes or small trees. Like most other members of the Erica family, they dislike lime. *Pernettya mucronata* is a pretty, compact evergreen and is good for beds on the margins of lawns. Its white flowers in May and its bright coloured fruits in autumn are alike beautiful. The Holm or Evergreen Oak (*Quercus Ilex*) forms a very fine tree in the south and south-west counties. It stands sea air well and it may be used for shelter or specimen trees. In a few places it has been tried as a hedge plant with satisfactory results, for it stands pruning well. There are also other Evergreen Oaks, such as *Q. auta*, *Q. cuspidata* and *phillyraoides*, all of which are useful plants. Another noteworthy

evergreen tree is the Golden-leaved Chestnut, *Castanopsis chrysophylla*. This is a Californian species with leaves very like those of the common Evergreen Oak in outline, but golden on the reverse side. Its fruits are edible, but require fifteen months to mature. Its proper use is as an isolated specimen in a rather sheltered position. *Nothofagus betuloides*, a neat leaved evergreen Beech from South America, is a rare and ornamental tree and is hardy in the South of England. The genus *Escallonia* offers several very beautiful evergreens for the milder counties, the best of all being *E. macrantha*, for it is valuable alike as a bush or hedge plant. Where this succeeds, the New Zealand Veronicas may also be expected to thrive, and in Devonshire, Cornwall and South Wales they are among the most useful of flowering evergreens. *Camellia japonica* and its varieties is far hardier than many people imagine, and it forms a fine bush in the open ground in the South of England.

Among the Barberries are a number of good evergreens, very notable ones being *B.B. Darwinii*, *stenophylla*, *japonica*, *Aquifolium*, *Hookeri* and *candulula*. They should be represented in every garden, and in *B. stenophylla* we have perhaps the best of all-round hardy shrubs for general planting. *Cotoneaster* is another family which produces useful evergreens, with the additional attraction of bright red berries. *C. buxifolia* is a vigorous bush, 10ft. or 12ft. high, of wide spreading habit, and *thymifolia* and *microphylla* are neater plants, growing a foot or two high in the open, or as much as 15ft. against a wall. Laurels, Portugal and Common, have been

over-planted and maltreated. With their branches clipped hard back each year they form stiff and hard banks in many gardens, and as such are an eyesore, but when allowed to grow freely they develop into remarkable ornamental specimens, and are then among the finest of all evergreens. Such varieties of the Common Laurel (*Prunus Lauro-cerasus*), as *magnoliifolia*, *Ottom* and *Latifolia* are among the most worthy of notice. The Sweet Bay (*Laurus nobilis*) though often grown as a clipped bush, forms a very fine bush or tree in some parts. In South Wales there are specimens over 40ft. high and as far through. Evergreen Privets are found in *Ligustrum lucidum*, *L. japonicum* and *L. coriaceum*, in addition to the common oval-leaved kinds. The *Phillyreas* are closely allied to the Privets. *P.P. media* and *latifolia* grow into bushes 15ft. or more high, while *P. decora* and *angustifolia* are usually 5ft. or 6ft. in height. For moist, shady places in peaty soil *Gaultheria Shallon* is an excellent bush, 5ft. or 6ft. high; while *Kalmia latifolia*, *K. angustifolia*, the *Ledums*, *Peris* and *Lencothoe Catesbaei* are other good peat-loving shrubs.

Among the *Vibernums*, the *Laurustinus* *V. Tinus* is a very well known and favourite shrub, its waxy white blossoms expanding during winter and early spring. Then we have the new *V. rhytidophellum*, a very remarkable bush, with oblong wrinkled leaves a foot long, which well deserves a sheltered position. Several kinds of *Eleagnus* command attention as vigorous bushes 6ft. to 12ft. high and as far across. *E. macrophylla* has silvery leaves and *E. pungens* green leaves. The last-named has, however, a number of very

MOST GLORIOUSLY COLOURED OF BARBERRIES, *BERBERIS*

DARWINII.

One of the hardiest shrubs in cultivation.

AMONG THE HANDSOMEST OF RHODODENDRONS, *R. NUTTALLII*.

Hardy only in favoured districts.

pretty variegated-leaved varieties of which *Simoni* and *S. aureo-variegata*, with golden marked leaves, are specially worthy of note. *Trochodendron aralioides* is a handsome evergreen bush or small tree from Japan, with bright glossy leaves and curiously shaped yellow flowers. It well deserves a sheltered position and good loamy soil, to which a little peat has been added.

Magnolia grandiflora is one of the finest of all evergreens, both by reason of its large, leathery leaves and its fragrant white flowers, which are as much as 9 ins. across. In the southern counties it

grows into a shapely bush or tree 15 ft. to 20 ft. high in the open, but elsewhere it is usually grown against a wall. The newer *M. Delavayi* has also very handsome evergreen foliage, but it is less hardy. The Ivy has already been mentioned as a suitable plant for clothing the ground beneath trees, but its uses are innumerable, and perhaps it is never seen to greater advantage than when it has covered a large tree, and its branches have assumed the flowering or adult stage. It then develops as a bush rather than a climber. By propagating from these bushy forms a distinct race of bush or tree

Ivies has been obtained, which are excellent for beds and borders. The leaves of these have all the different colours and the gold and silver variegations for which other Ivies are renowned. *Daphniphyllum macropodum* is a large-growing evergreen from China and Japan, with decorative bluish-green leaves, which have red stalks. Its flowers, however, are of no account. *Euonymus japonicus* gives excellent results near the sea, while *Olearia Haastii*, a neat evergreen with white flowers, may be planted quite close to the sea, and also flourishes in many inland gardens. W. D.

WATER AND BOG GARDENING

V.—Plants for Streamside and Bog.

NOW, after a somewhat extended excursion upon the surface of the water (see pages 117 and 139, THE GARDEN, March 10 and 17) we come ashore again, to be faced with a vista of bare earth, turf and sloping bank. Ashore, it is true, but not upon dry land, for we have purposely arranged the overflow of our water garden so that it is surrounded by a belt of bog and semi-boggy earth that will always remain consistently moist and thus enable us to provide a happy home where we may group a large number of Ferns, Grasses and flowering plants that only succeed when in the neighbourhood of water. If our task in selection has been a complicated one before, it certainly does not become easier when we deal with the margin.

Nature has been lavish in the water, prodigal in its vicinity, and from among the vast array of plants available we must select those of suitable stature and character to conform with the remainder of the garden. Space being ample, one can use masses of Bamboos, Pampas Grass, *Gunnera*, *Arundo*, *Iris*, *Spirea* and so forth; but if restricted to a few square yards or feet, equally beautiful plants are waiting to serve us in the *Cimicifugas*, *Funkias*, *Helonias*, *Primulas*, *Monkey Musks* (*Mimulus*), *Parnassias* and *Sarracenias*, to name but a few. Suitable material is there and only awaits our use. A distinction should be made between those that love the really wet conditions, right at the margin of the water itself, where the stream or pond overflows its banks and the numerous kinds that appreciate rather less boggy conditions in soil which is never absolutely dry. In most cases the natural soil of the garden—with the addition of some manure—will be found good enough; in others the making of special "beds" of peat or loam is abundantly repaid by the health and happiness of the plants.

Let us follow a similar grouping to that which we adopted in a former article and deal first with species that are suited to the small or medium-sized water garden, following with the more vigorous later on. By the way, it is not at all a bad plan to let a few—say a couple—of the "big" growers escape from the latter list and take a place beside the medium-sized water garden. It must not be overdone, of course, for it is a question of very careful proportion, and one must never allow one over-large plant to "dominate" the whole.

Where it is a question of the moderate-sized water garden, there are some things that must be ruled out absolutely. *Gunnera manicata*, for instance, is so immense that in three or four years' time it would be larger than the "garden" itself; but there are others that are still commanding in their proportions and yet do not spread so vigorously as to swamp everything else in their

neighbourhood. A useful large grower that is not too overpowering is to be found in *Acanthus candelabrum*, a very stately specimen, with glossy leaves between 2 ft. and 3 ft. in length, that rapidly

its foot-tall umbels of lilac flowers, should not be overlooked for spring flowering. Grouped in small colonies in moist, peaty soil, the American Cowslips or Shooting Stars (*Dodecatheons*) in variety make

THE QUAINLY BRACKETED SAURURUS LOUREIRI.

makes a splendid clump. Bamboos provide the small water garden with some magnificent material for judicious grouping, and prefer a not too light soil and one that is never flooded. Among the best dwarfs are *Arundinaria Fortunei* fol. aur. variegata, 1½ ft. high and charmingly striped yellow and green; *Arundinaria Veitchii*, good for making broad green carpeting masses, 1½ ft.; *Bambusa disticha*, with slender green stems and narrow leaves, 2 ft.; *Bambusa pygmaea*, one of the smallest Bamboos in cultivation, a very rapid grower and, where kept in check, useful for even the smallest garden, as it does not exceed 1 ft. in height. *Phyllostachys ruscifolia* is slightly taller, reaching 3 ft., with slender brown stems and erect green foliage, very useful where space is somewhat more ample. The Marsh Marigolds, especially *Caltha palustris flore pleno*, the double Golden Kingcup and *C. monstrosa plena*, a very strong-growing giant form, are grand right down on the margin of the water, and can scarcely have too moist a place; while the double Cuckoo Flower, *Cardamine pratensis* fl. pl., with

a gorgeous display in early summer, when their long, naked stems, terminating in heads of as many as twenty to thirty cyclamen-like flowers, are fully expanded. Among Ferns, *Onoclea sensibilis* and various *Osmundas*—especially the Royal Fern, *Osmunda regalis*—are grand; but should only be planted to a limited extent unless space is ample, for both are large growers, while *Onoclea sensibilis* spreads very rapidly, where it is happy, by means of creeping rhizomes. Both will grow and do well close to the water in semi-bog. All the *Funkias* are splendid if the smaller growers are chosen, *F. Sieboldiana* with its glaucous foliage and *F. ovata marginata* being especially worth consideration.

Few hardy Grasses fail to do well, and one might mention an enormous number without exhausting the possibilities; but around the moderate-sized garden the following should supply a sufficient choice: *Carex gallica* fol. var., with tufted foliage and golden variegation, 8 ins.; *C. Morrowii*, also prettily variegated, 1½ ft.; *Eriophorum angustifolium*, the quaint little Cotton

Grass with dark green leaves and small wads of fluffy white cotton on the top of the flowering stems; and *Glyceria aquatica* fol. var., which will grow where its roots are almost continually submerged and forms a beautiful tuft of pink, white, yellow and pale green variegated leaves, 1½ ft. high. I have referred to the immense size of the Gunneras, which uts them for the large lake margin, but there is one species of these, *G. magellanica*, a little plant from Chili that, while duplicating the form of its immense brethren, does not exceed 2 ins. in stature, and so can be "fitted in" to even the tiniest rock pool surroundings with perfect harmony. *Helonias bullata* makes a business of flowering early, and so produces

its blooms in April, forming, indeed, one of the showiest plants of its season. Put this among the spongy peat lovers and you will reap a rich reward in the beautiful spikes of rosy flowers that rise from rosettes of shining deep green leaves.

Saururus Laurei is most distinctive and striking with sturdy, upright stems and green foliage, each stem terminating in a short spike of flower, while the two leaves immediately below the flower-spikes are pure white. It is the two upper leaves, with their snowy whiteness, that give the plants such an extremely striking appearance, and the whole effect throughout the summer is quite unique.

H. W. CANNING WRIGHT.

(To be continued.)

FLOWERS AT THE MIDLAND DAFFODIL SHOW

ALTHOUGH, compared with what I have seen in the past, there was nothing like the same space occupied by the competitive exhibits in this year's Show, there were a large number of good flowers, but before I deal with any in detail I would like to make one or two remarks. With regard to the red cups raised by the late Mrs. R. O. Backhouse, I think we shall have a look upon them rather as flowers for decoration or market, than for show. They cannot help "hitting one in the eye," they are so wonderful and so far removed from Nature and from all the earlier efforts of the

hybridists; but when they are put in the scales against the weights used by judges at a show they are found wanting, taking them as a whole, in the matter of their perianths. That wonderful red bowl which was to be seen on the top tier of Dr. Lower's exhibit for the Cartwright Cup, and to which I alluded in my last notes, was surrounded by six very uncouth perianth segments. The question for a judge to consider is whether such a grand cup, or bowl as I called it, is of sufficient importance in itself to cover the deficiencies of the perianth? I can well imagine there is very likely a marked difference of opinion about it, just as

there once was in the Tulip world between the southern florists who put the shape of the cup and the purity of the base before the regularity of marking insisted upon by their brethren of the North. The consequence was that a bloom which would rank high in Surrey was of only second rate value in Lancashire. So it may be with our modern Daffodils. We have two or three questions to ask and answer when we are judging. First: Am I judging from a show standpoint or from a garden or market standpoint? The Narcissus Committee of the R.H.S. has answered this for us, inasmuch as it differentiates its awards. Secondly: Is the corona a more or less important factor in the making of an ideal flower than the perianth? And, as a supplementary question, Can novel colouring outweigh defects in either the perianth or the corona? This is where judges differ. While on this subject I would like to point out that an award for garden purposes and an award for market or cutting are by no means interchangeable honours. To me nearly all red cups and red edges are disappointing in the garden on account of the short time they last without burning. The owner of a beautiful bit of colour at Birmingham said to me, "A couple of hours of bright sunlight does for it." On the other hand, if a red cup be protected in some way or if the bloom be gathered in a half unfolded condition and opened in water, then its colour is preserved. All these points are sometimes overlooked by those who know comparatively little about Daffodils, with the result that disappointment ensues when the flower is planted in their gardens. If the object of a purchase is the "show-ster," then everything is quite different. To continue my list where I left off in the issue for May 5th. I

SILVER RUPEE, A FINE WHITE GIANT LEEDSH

SOLARAFT, A JONQUIL HYBRID WITH AN ORANGE YELLOW CUP.

would mention first of all Beersheba, which may well be what its raiser, Mr. Guy Wilson, claims for it, the largest white trumpet Daffodil in existence. In his extremely well grown lot which he put up for the White Daffodil Trophy, it looked immense. White Emperor and White Knight looked very small people beside it. The perianth was a good 5½ ins. across and the segments were well imbricated and set at right angles to the trumpet, which was slender and well proportioned. The flower was an ivory white. Not so white that is as Mrs. Lower when they were placed side by side.

Silver Rupee is a fine white giant Leedsii, raised, I think, by Mr. Duncan Pearson. It has a nice smooth perianth of which the three inner segments come a little forward. It is one of those flowers in this class so near to being a trumpet that only careful measurements decide its place. It looked very white among its neighbours in Messrs. J. R. Pearson and Sons group, but I did not put it beside any other variety. If Silver Rupee might almost have been a white trumpet, Sollaret, if its parentage were unknown, might be classed as a yellow self Incomparabilis. It is, however, a Jonquil hybrid. The cup is almost an orange yellow, while the perianth is a little paler. The flower is well proportioned and its texture rich-looking and good; not "cotton backed" as they would say in Holland. Delhi, which was raised by the late Mrs. Backhouse, was to me the most pleasing of all the big red cups at the Show. The ivory white perianth was a little thin looking, but the large cup, which measured 1½ ins. across the top, was a beautiful soft, almost scarlet red. It looked so bright and pretty. Another rather captivating bloom was the soft red, flat eyed Pembury, a seedling of Mr. W. F. Mitchell's. It is a white perianthed Barrii and the eye, which has a diameter of 1½ ins., is somewhat curiously fluted from the centre to the edge. In Dinkie, a seedling of Mr. Chapman's, we have a small but remarkable flower. It was easily first in the single bloom, yellow perianthed, Barrii class and is distinguished by the curious greeny tone of the yellow which is the same shade in both cup and perianth, relieved only by the narrow clean rim of red round the cup. Dinkie, I am told, means something "all right." Understanding this, we see the appropriateness of the name for the small beauty. The whole flower is very smooth. Hexagon, which was raised by Mr. Guy Wilson, is a most attractive Giant Leedsii with flat pointed segments and a long pale lemon cup which, when you look down it, is seen to have a greeny base in contradistinction to the usual more or less yellow. Another of the same class that a good many of us thought highly of was Sea Shell, which won the first prize in the Giant Leedsii for Mr. Cranfield. It had quite the look of an Incomparabilis, for the cup was a decided yellow. The perianth had a diameter of 4½ ins. and was very smooth and white. One cannot pass over Lady Superior, raised by the late Mrs. Backhouse. It is a bicolor Barrii, very flat and with a pale yellow cup, edged red. Somehow I do feel proud to think that one of us Daffodil people was the author of that great war hymn "The Supreme Sacrifice." I was uncertain if it was *our* Mr. J. S. Arkwright until I asked him the question at Birmingham. He put up a capital lot for the "thirty-six" open class and among them my eye caught at once a fine bicolor Barrii with a particularly white perianth and a bright and striking yellow and red cup. It is named Crucible. Corona is a good "Poet," distinguished by its dark wide red edge to the eye. Is Kukri a wrong way of spelling Kuckri? or is Kuckri wrong and Kukri right? or are both right? As I do not know in the least what it is or what it means, could some one tell me? I do wish our good friends would go in for more easily understandable names than we

are frequently regaled with. Think of this little selection, Cerimon, Tortrix, Swanbilda, Matamax and Thordis! They seem to an ignoramus like myself very weird. My immediate point is that Kuckri in the R.H.S. Book (1923) is put down as a yellow trumpet, while Kukri, as I saw it at Birmingham, is an incomparabilis.

Gold Mohur, raised by Dr. Lower, is an excellent example of a bunch flowered Jonquilla hybrid. The individual flowers remind one of Buttercup, both in shape and colour. Of those with pinky

segments John Peel has a very effective, almost scarlet eye, but the perianth segments are not sufficiently imbricated for a show flower. This variety and June, which was mentioned in my last notes, are probably the best of the coloured perianths.

I had not seen the beautiful pure white trumpet Mrs. Lower before. I can well believe that it was the most beautiful flower in the 1922 Show. Without any doubt it is one of the very best of its class in existence. JOSEPH JACOB.

NOTES FROM THE EDINBURGH ROYAL BOTANIC GARDEN

APRIL began to shake out her skirts very early this year, and I have never seen so many flowers out in Scotland at this time. With the first days of the month the rockery here seemed to be full of interesting flowers; many Primulas, for instance, some uncommon Barberries, a large

prostrate in habit. Large masses of white can always be achieved this month by the Perennial Caudytutts, which are represented here by such kinds as *Iberis Jordani* from Asia Minor; *I. Pruiti* from Sicily, with very conical flower-heads; *I. pinnata* and *I. coraeifolia*, both from South Europe and both of decided dwarf, creeping habit.

THE FRAGRANT WHITE BLOSSOMED OSMANTHUS DELAVAYI.

number of Rhododendrons, also some less rare plants which need never be despised. We might do well to make a note of some of these more ordinary plants so that we may grow them ourselves for the excellent colour effect they produce.

For such useful purposes one may choose *Saxifraga Paulinae*, a very free-flowering hybrid between *Burseriana* and *Ferdinandi-Coburgi*, bearing large, pale yellow flowers. At Edinburgh it seems so healthy and showy on a high ledge that it carries out its reputation of being one of the easiest to grow. The well known *S. sancta* is now a sheet of yellow blossom—it is delightful to see its energy and vigour. Clinging and foaming over a rock *Anthemis macedonica* may be seen, a rounded mass of pleasant ferny foliage from which spring the white, daisy-like flowers. It is a plant that will bloom over a long period, for all the *Anthemis* tribe are most continuous bloomers. *Achillea ageratifolia*, from Greece, is a rather similar plant, but smaller and more

Where the tiny little Sea Thrift, *Armeria caespitosa*, will "do" there is no more charming little rock plant, for it gives the softest and daintiest shade of pink. In the Edinburgh rock garden it has been persuaded and gently led into establishing itself along some crevices between big boulders, and little colonies have dripped over and formed those happy pictures that are occasionally achieved when art and nature agree to walk hand in hand. *Lathyrus vernus albus* and *Achusa myosotidiflora* are both growing under the shade of trees. In spite of their long names they bear really charming flowers of uncommon colour, and both grow about 8 ins. high. The former is of unique creamy apricot shade; the latter bears panicles of that pale true blue colour that is so rare and so pleasant to see. If more vivid colouring is desired, there is *Berberis stenophylla corallina* to satisfy one with its orange and coral flowers, small but so numerous that they light up the dark rock face down which they

hang. I saw it here first in 1921 and it is still a small and slender shrub.

Erythronium Johnsoni, in a shady nook, with its handsome pink flowers is worth remembering as one of the best of the Dog's Tooth Violets; and *Pulmonaria alpina*, though its label states it only to be "of gardens," will nevertheless be found as a nice tufted plant about 10 ins. high, literally covered with fine bells of intense blue—that rich, strong shade that is so satisfying. There are two other Barberries worthy of mention in *B. verruculosa* from China and *B. Gagnepanii*, both about 2 ft. high and bearing pretty little pale yellow bells.

To anyone who loves *Rhododendrons*, the rock garden is worth visiting to see these alone, and how many suitable species have now been introduced. At Edinburgh the scale is so generous, the boulders so huge, that even such kinds as *R. Jacksoni* look in proportion. But we will consider the average rockery, and for such the following *Rhododendrons* are suitable, being of dwarf habit, yet bearing showy flowers in April. Besides *intricatum* there is *Edgarianum*, of the same blue-mauve colour and of very neat habit. Among the smallest of all to be seen are *Valentinianum* and *impeditum*, both from the Yunnan and both only some 6 ins. or 8 ins. high, forming the dearest and quaintest of little rounded bushes, the former having yellow and the latter mauve flowers. A little taller comes that lovely hybrid *glaucum* × *ciliatum*, which I have seen doing well here since 1921, always a gay sight from April till late May, with quantities of large pink bells, growing only 2 ft. high at most. *RR. racemosum* and *ciliatum* are well known nowadays, but it

is interesting to see how splendidly *ciliatum* thrives on a high, exposed ridge, flowing over it in a sheet of pink, proving both effective and hardy in this curiously difficult position. A shade taller again are *Ponastylum* from West China, the pale yellow flowers produced on upright 2 ft. bushes with nice bronzy foliage, and *Lippophiaoides* from the Yunnan, perhaps taller, with mauve flowers. *Rhododendron multiflorum* reaches 3 ft. in height and has comparatively large bells, white tinted with pink in a very charming way. I think this short list might safely be taken as a good selection for anyone who admires these shrubs and wants neat-growing kinds with small foliage and showy blossoms.

Out of many *Primulas* blooming in April two call for special remark. *P. glaucescens* is really distinctive in its stiff pointed leaves and in the richness of its red-mauve flowers, which are big for the size of the plant—a little gem only 2 ins. or 3 ins. high. I see it called *P. calycina* in some

books, and that it likes shady, well drained situations. *P. apennina*, from the Alps or Piedmont, bears auricle-like flowers of a lovely shade, a curious claret-orange that is unique; added to which it blooms freely and continuously. It likes shade and a limestone soil for preference. *Clematis alpina alba*, which has been out here since the end of March, would appeal to many people for the pretty way it creeps over rocks, covering them with trails of soft green foliage and pretty little nodding bells, which are white tinted purple. *Pimelia Traversii* is an interesting dwarf shrub from New Zealand, very like a miniature *Veronica Traversii*, with the same symmetrically arranged leaves, but the tiny white *Pimelia* flowers are in clusters at the ends of the shoots, these being some 12 ins. or 14 ins. high. A large and healthy group of *Osmanthus Delavayi* occupies a rocky spur. It appears to be perfectly hardy even in this cold climate, and its small white flowers are showing freely.

M. E. STEBBING.

"BREAKING" OF TULIPS AND MOSAIC

SOME years ago, in 1913 I think, articles appeared in *THE GARDEN* on the "breaking" of Tulips, the occasion being a report by Mr. G. W. Leak on "breaks" to the extent of 30 per cent. in some varieties, whereas the percentage of broken flowers had in other years been very small—as low as two per thousand. Mention was made of the great desire of the old-fashioned florists of seventy years ago, in the halcyon days of Tulips and seedling raising, to obtain fine specimens of broken

or rectified flowers, and the efforts they made to induce the break. One garden authority commended "taxing the resources of the bulb, weakening its energies and reducing its strength," instanced by "allowing its seed pods to ripen on the plant," as likely to produce the desired effect of rectification or break, the florists of those days looking upon the self or breeder stage as a preliminary to a finer development.

In the case of Mr. G. W. Leak the breaking was deplored, Darwins and Cottage Tulips being very much preferred in the self colours. In the case of the old florists, however, the breaking was desired and the merit of the flower judged by its form, its colour and its marking, whether beautifully feathered or grandly flamed. It may be said the English Tulip was bred to break, and the treasured bloom had form, colour and marking.

In these modern days, when fewer individual garden flowers are specially studied and their natural development worked out, the main desire of the Tulip grower is to keep his flowers in the self or breeder stage. All Tulips

will break some time or other, that is to say, all Tulips that have the anthocyanin pigment under the skin. There are, of course, true selfs, yellow and white without this colour pigment, but they are few in number. We are concerned at the moment mainly with coloured Tulips.

This breaking may occur in a year or two years after the seedling Tulip has bloomed as a self or breeder, or it may happen any time forty years hence perhaps. We saw florists' Tulips bred for their breaking properties still in the breeder stage—as shewn last year—though they were raised as seedlings sixty years ago. This fascinating feature of the Tulip has always been a mystery.

Recent correspondence from Washington, D.C., ascribes the breaking of Tulips to the mosaic disease. In the United States Department of Agriculture Bulletin No. 797, it is stated "all the classes of bulbs—Hyacinths, Narcissi, Tulips—are more or less affected with mosaic disease," and suggests the aphid as the main carrier.

While admitting that "the cause of breaking has not been demonstrated," Bulletin 108 of October 19th, 1922, refers to broken stocks of bulbs as "these mosaic varieties," and further says "the real cause of mosaic diseases in other plants has not been demonstrated though extensively studied."

The report of the Potato Conference, R.H.S., 1922, states that a living parasite is the cause of mosaic, and that the disease may occur in other plants besides the Potato, Tobacco and Tomato.

An American correspondent informs me that the breaking of Tulips is caused by mosaic, a protozoan disease the carrier of which is the aphid, whose life-history has not been worked out.

The American experiments (*vide* Journal of Agricultural Research, Vol. XIX, No. 7) establish the transmission of the mosaic disease of Irish Potatoes and seem to indicate that infection does not result from growth in soil that produced mosaic Potato plants the previous season, but points to aphids as carriers. This I learn is the deduction drawn from British experience; but the cause of mosaic is not yet known.

It may be that Tulip bulbs and plants are subject to this disease, but it by no means follows that mosaic is the cause of breaking, whatever be the controlling factor in the incidence of the break; it may be apart from mosaic, even though the Tulip be subject to that disease in addition.

In reading old records of "Tulip disease" one frequently finds the reference "like Potatoes."

Hale, Cheshire.

CHARLES W. NEEDHAM.

THE LILAC-TONED PRIMULA GLAUCESCENS.

HARDY FUCHSIAS

THE hardy Fuchsias are of simple needs and requirements, and their easy cultivation makes them ready to befriend both amateur and beginner. Furthermore, hardy Fuchsias can be confidently recommended to those who have need to economise the labour bestowed on the garden, for, when once established, these plants demand but a minimum of attention. Also, in addition to these convenient advantages, hardy Fuchsias are exceedingly beautiful and valuable garden plants. Their beauty is not of the showy or ostentatious kind, but they appeal to the senses in the modest manner of the Lavender or Rosemary. Doubtless, also like Lavender, much of the fascination of hardy Fuchsias is due to their inseparable association with old-time and quaint surroundings. It is as well to bear this point in mind when selecting their position. If there is not an Old English or sunk garden, it may yet be possible to locate the plants near a quaint flight of steps, a sundial, arbour, or perhaps an old-fashioned retaining wall.

Their very lengthy flowering period is a point much in their favour. Hardy Fuchsias are in blossom for several months during summer and continue well into autumn. Therefore, the stronger growing kinds can be utilised to brighten a shrubbery at a season when flowering shrubs are scarce. For this purpose *Fuchsia Riccartoni*, and its varieties, are the most suitable. The majority of hardy Fuchsias are cut to the ground, or nearly so, by frost each winter and have to make fresh growth the following year, but *F. Riccartoni* is a notable exception and is seldom touched by frost. Consequently it attains a far greater height than the majority of species. Under normal conditions it will grow 5ft. or 6ft. high and in favoured localities on the South Coast it will grow yet taller. In some districts *F. Riccartoni* is much used for hedges, etc. Its flowers are red and purple in colour. There are several good hybrid forms of this species. Of these *F. R. "Enfant Prodigue,"* with large semi-double flowers, is probably the best.

F. macrostemma, better known as *F. gracilis*, is, as the latter name implies, an exceedingly pretty and graceful species. It has arching stems and freely produced long-shaped flowers. In an ordinary border its height is about 3ft., but plants double this height can be grown in sheltered corners or by planting them at the foot of a south wall. There is an effective variegated form of *F. gracilis*, with white and green leaves and new shoots prettily shaded pink, but this variety is much less hardy than the species.

F. corallina, sometimes called *F. exoniensis* is a very distinct species. It is rather uncommon and deserves to be more extensively cultivated. The flowers, red and purple in colour, are handsome and almost as large as those of the greenhouse varieties. It grows about 18ins. to 2½ft. high. When planted in a suitable position in a rock garden it is particularly effective, for its drooping flowers when displayed over a projecting ledge of rock are seen to full advantage. *F. punila*, a pretty miniature species not more than 9ins. high, is also suited to rock gardening.

F. globosa, about 2ft. high, with scarlet globular flowers, and *F. myrtifolia*, a very free-flowering species, are worthy of note.

These hardy Fuchsias are easily increased by means of cuttings inserted in a shady, cool frame during summer. When rooted, they may be transferred singly to small pots and may be grown on in an airy cold frame, or plunged in ashes or sand in a sheltered spot in the open. The following spring they will be ready to put in their permanent quarters.

Planting is best done in spring, in order that the bushes have time to become thoroughly established before the following winter. In some rather exposed localities it is advisable to mulch the

ground round the plants with leaf-soil or cinders during winter as a protection from frost. This mulch may be removed in spring and is seldom required by old, well established specimens. L. G.

THE DOUGLASIAS

BELONGING to the *Primula* family, the genus *Douglasia* is closely allied to *Androsace*, and in general habit and appearance the species in cultivation at the present time very much resemble many of the members of that choice genus of alpine plants. There are five known and recognised

D. nivalis.—This species was in cultivation in this country early in the last century, but is not, as far as I know, at the present time. It is a taller-growing plant than the former, with rosettes of linear, obtuse, hairy leaves. The pink flowers are produced in sub-umbellate clusters on stems 3ins. to 4ins. high. *D. nivalis* is found

DOUGLASIA LAEVIGATA, A DENSE-GROWING TUFTED ALPINE WITH ROSY PURPLE FLOWERS.

species of *Douglasia*, one of which (*D. Vitaliana*) is found on the European Alps, while the others have their home on the mountain ranges of North America. All the American plants have rosy purple flowers, the European one alone having yellow blooms. The following three species are, or have been, in cultivation.

D. LAEVIGATA.—A recent reintroduction, this plant was originally in cultivation in the year 1888, seeds having been sent over by Dr. Gray in 1886. Plants flowered, and the species was figured at that time in the *Botanical Magazine*, t. 6996. It evidently died out again and was lost to our gardens till it was again introduced by Mr. A. R. Bulley early in the present century. He exhibited plants in flower at the meeting of the Royal Horticultural Society on April 1, 1913, when it obtained an award of merit. It is a dense-growing, tufted little alpine, with closely packed rosettes of narrow, pointed, green leaves, forming a compact cushion. The rosy purple flowers, each one-third of an inch in diameter, are borne in clusters of two to five together on stems about 1in. long. It is a beautiful little plant, and under suitable conditions grows freely, quickly forming tufts several inches across. Preferring an open, sunny situation, it should be planted in a mixture of peat and gritty loam, while the roots need plenty of moisture during the growing season. A native of the Alps of Oregon in North America, this plant is usually found growing in the clefts or fissures of rocks near the summits of the mountains.

on the Rocky Mountains at an elevation of about 12,000ft., and is a charming little plant well worthy of reintroduction.

D. VITALIANA.—Also known in gardens under the names of *Androsace Vitaliana* and *Gregoria Vitaliana*. It is of low-growing, tufted, stoloniferous habit, forming a carpet of grey-green foliage, studded during the early summer with rich yellow flowers. It is somewhat variable in appearance, and there are two well marked forms in cultivation, both with similar flowers to the type. *D. V. var. cinerea* has longer leaves of an ash grey colour, while *D. V. var. pratutiana* is more compact in habit, with shorter, blunter leaves of a silver grey shade. *D. Vitaliana* is found on the granitic Alps of Central Europe and in the Pyrenees at an elevation of 6,000ft. to 9,000ft., where it is usually met with growing in a shady mixture which contains little soil, but which gets abundant moisture from the melting snow. In the rock garden, planted in well drained, gritty peat and loam, the plant grows freely, but does not always produce its flowers so abundantly as one would desire. It prefers an open, sunny situation on a rocky ledge, providing there is plenty of moisture during the growing season, while it is an excellent plant for the moraine. Like the other two species, *D. Vitaliana* may be propagated by means of division after flowering, and from cuttings inserted in sandy soil and placed in a close frame in July. They are also readily raised from fresh seeds sown in spring. W. L.

GRAPES

The Importance of Early Thinning

ACCORDING to my diary, on the tenth day after the first flower opened thinning was commenced with the Black Hamburgh, and the most forward berries measured three-sixteenths of an inch in diameter. Seven days later the size was doubled, *i.e.*, three-eighths of an inch, and on the twenty-first day they measured half an inch. They then continued swelling till the twenty-fifth day, when the berry stems had commenced to harden in the centre, and two days later the seeds had also commenced to do so at the portion nearest the stem. They now measured eleven-sixteenths of an inch. Twenty-six days after this they had only added another one-sixteenth, making up three-quarters of an inch, and colouring had commenced. During colouring most of the berries increased to 1½ ins. We thus see that it is very desirable to have the thinning completed as far as possible within three weeks from the commencement of flowering, because in twenty-five days from that date there were visible signs of the hardening of the berry stems and swelling had almost stopped for the next twenty-six days.

The bunches had been reduced to the desired number almost as soon as they were visible, and all unnecessary shoots were rubbed off as soon as they appeared.

The Vines, up to the time of the hardening of the berry stems, had shewn little globules of extravasated sap on the stems of the laterals, also on the leaf-stalks and the back of the leaves. These then dried up, leaving black specks the size of a pin's head, such as the minitiated sometimes take to be insects. Weakly Vines do not shew these globules, and vigorous, well fed ones tell us by the drying up of them that they have nothing to throw away.

Another sign of hard work is that there are very few new growths made during the stoning process, and older growths almost cease to extend.

So we see how necessary it is for the roots to have full steam on at this juncture, with no unnecessary dependents, and for us to be sure that all is right in the commissariat department. But this requires some knowledge and careful attention on the part of the cultivator, for the Grape Vine, unlike other fruit-bearing plants, does not commence root extension, nor presumably root feeding, with the exception of water, till some of the leaves have attained more than half their natural size, so that the time is very limited between the roots starting foraging and the great strain in process during the stoning of the berries.

When the roots do make a start is clearly indicated by the leaves, which up to this time are a pale yellowish green, but now patches of an almost blue colour may be seen in those which first expanded. This gradually mixes with the lighter shades and thus produces the desired colour of green, shewing that all is in working order. Anything which will tend to retard the actions and signs mentioned must be avoided. If the soil is sour, unduly wet or too dry; if strong nitrogenous manure has been applied just before the time for the roots to start; or anything has been done which will interfere with the infantile progress of the roots, the leaves and fruits will very soon give signs that they are not happy.

When a nitrogenous stimulant is necessary in the spring, as it sometimes is in a non-retentive soil, it should not be applied much before the leaves indicate that root extension has commenced. Nitrate of soda, sulphate of ammonia or nitrate of potash (saltpetre), one pound to the perch, will be suitable, supposing there is no

deficiency of phosphates, potash, lime or decomposing organic matter in the border. The nitrates are quickest in action, and the sulphate holds out the longest. If the soil is non-retentive and takes much water, either of these may need replenishing before colouring commences, because without active nitrogen the other food constituents are useless.

When a prepared concentrated manure has to be depended on, it is very important not to exceed the quantity prescribed, but it is often desirable to add a little of one of the quick-acting nitrogenous manures I have mentioned during the stoning period, because the nitrogenous portion of the ready-made mixture is the most quickly exhausted, and when this happens, as I have already said, the other ingredients cannot act. On the other hand, too much nitrogen is the cause of many failures, because it produces

gross growth composed of large unfurnished cells, which collapse at the time of ripening and leave flattened instead of cylindrical growth. It is one of the causes of shanking and also of shrivelling in fruit when reaching maturity. The cells during their progress need to be tensely filled, and this cannot be when they grow faster than the supplies.

It is difficult in large establishments to finish the thinning in the time I have shewn to be the most suitable, but if it can possibly be done before the berry stems commence to harden, it will be much easier, for one need not be particular about cutting them clean away at the base, because any portion left will shrivel up, whereas later on one must be careful to cut them clean away, as the fruit is liable to be injured by them, especially when it has to travel.

WM. TAYLOR.

AN INTERESTING PERENNIAL

THAT old-fashioned perennial, *Dictamnus Fraxinella* (albus), is very interesting. Both the purple and the white varieties are well worth growing. It is a pretty flower and a neat growing, shrub-like plant, which gives out a sweet scent and diffuses an inflammable essence. On a still, hot summer

and only in very warm and dry weather is enough distilled to break into flame. On account of this peculiarity, which, so far as I know is not shared by any other plant, it is sometimes known as the Burning Bush. The *Fraxinella* ripens seed freely, but I have never found a self-sown seedling, the reason I think being that the young shoots even

of mature plants are greedily attacked by slugs, and young seedlings probably never get a chance of shewing themselves above ground. The plant quite dies down in the winter, and when the first sprouts appear the slugs are very likely to destroy the plant altogether, or, at any rate, injure it so that it will not flower, if it is not protected in some way. I use a zinc collar for this purpose.

The method by which this plant distributes its seed is most interesting to observe. On a sunny day the ripe seed vessels open one by one and the glossy black seeds are shot into the air with the force and sound of a tiny explosion—if one should happen to hit the observer in the face he will be astonished at the force of it. And these seeds are winged away in little shell-like vessels resembling the miniature bivalves one picks up on the seashore and, as with the real shell, one may find the two halves open but still joined.

Hard and shiny though the seed of the *Fraxinella* is, it loses its vitality if kept and, because of this, I have found bought seed quite useless, but it germinates readily if sown straight from the plant. It is probably because of the slight difficulty in increasing the stock that this interesting plant is so seldom seen.

RUTH BICKERSTETH.

SEED-PODS OF THE FRAXINELLA, *DICTAMNUS FRAXINELLA*.

day this scented vapour hangs over the plant and may be lighted with a match, when it bursts for a second into a crackle of blue flame. I have several times tried this experiment, but only once with success, and that was with a large plant of *Dictamnus albus* in a garden in Norfolk. The slightest breath of wind blows away the essence

the seed of the *Fraxinella* is, it loses its vitality if kept and, because of this, I have found bought seed quite useless, but it germinates readily if sown straight from the plant. It is probably because of the slight difficulty in increasing the stock that this interesting plant is so seldom seen.

CORRESPONDENCE

PLANTS FOR THE HEATH GARDEN.

SURELY one could hardly describe the flowers of *Erica australis* (page 206) as red. To my mind it is a deep pink of a lilac or mauve shade. In the case of *E. darleyensis*, too, I think red is wrong—pale pink, deepening in colour with age is more the colour of this variety. As regards *E. mediterranea* this is very similar in colour

light, so that the pictures are not as good as one could wish for. I did not take measurements, but the girth of the Crowhurst Yew is said to be 3ft. 8ins., 4ft. from ground. The trunk has been hollowed out and when this was done a cannon ball was found embedded in the trunk and this is still lying within the tree. Formerly, I believe, there were benches and a table within and it

bear but little resemblance to the *Antirrhinum* generally grown; indeed, it might almost be mistaken for some hoary-leaved *Campanula*, but the flower is quite of the familiar Snapdragon form. In addition to positions on walls, this plant is well adapted to cultivation in fairly dry pockets on the rockery, and in shallow pans it makes a very effective plant. It is not sufficiently hardy to withstand full exposure in bleak wind-swept spots, neither will it survive where the soil is surcharged with stagnant water, but in

THE YEW TREE IN TANDRIDGE CHURCHYARD, SURREY.

THE ANCIENT YEW IN CROWHURST CHURCHYARD, SURREY.

to *E. darleyensis* (*mediterranea hybrida*) and hardly red.—G. H. DALRYMPLE.

[There is always a difference of opinion about the colouring of Heaths, but most people would describe *E. australis* as some shade of red. Personally, we should describe *E. darleyensis* and *E. mediterranea*—they are much of a colour—as soft mauve pink, deepening with age to deep purplish rose.—Ed.]

THE SALPIGLOSSIS: A BEAUTIFUL, BUT NEGLECTED ANNUAL.

ONE of the most charming of our hardy annuals—the *Salpiglossis*—appears to be losing favour as it is rarely seen grown to any extent to-day. In the average garden one seldom meets with it, and in houses where once it was prized as a pot plant it is a stranger. It is curious that a flower so beautiful in its veinings and so lavish in its output should be neglected. As we all know who grow it, it is a lover of the sun and is never seen to greater advantage out of doors than when located in a south aspect. In the way of culture it needs no more than what is usually accorded to *Petunias*, a light sandy loam suiting it to perfection. It is as a plant for greenhouse and conservatory decoration, however, that one is able to appreciate it the most, and for grouping purposes it is worthy of greater attention.—CLAREMONT.

TWO GRAND OLD YEWS.

THINKING that pictures of the ancient Yew trees in Crowhurst and Tandridge churchyards, Surrey, might be of interest, I paid a visit to each on Easter Monday with the camera and enclose photographs taken. I was, however, compelled in both cases to work against a bright

light, so that the pictures are not as good as one could wish for. I did not take measurements, but the girth of the Crowhurst Yew is said to be 3ft. 8ins., 4ft. from ground. The trunk has been hollowed out and when this was done a cannon ball was found embedded in the trunk and this is still lying within the tree. Formerly, I believe, there were benches and a table within and it

is said fourteen or fifteen people could seat themselves with ease. Picnic parties used to hold carousals here, but this sacrilegious practice has long been stopped and the tree is now tended with the care it deserves. A door is fixed at the entrance and this is kept locked, but admittance is readily given to anyone wishing to enter. The age of this tree according to some authorities far exceeds a thousand years.

The Tandridge Yew has a girth of over 30ft. and has an immense spread of branches, many of which rest on the ground and are still in vigorous growth. The tree appears to have been broken at a short distance from the ground in early life and grown on with three leaders. I do not know the computed age of this tree, but for antiquity it cannot compare with the Crowhurst specimen, yet both are well worth travelling many miles to see.—H. C. WOOD.

A USEFUL ANTIRRHINUM FOR WALLS.

THE homely and old-fashioned Snapdragons, varieties of *Antirrhinum majus*, are so well known—indeed, so universally popular, that they need no word of description or recommendation. However, *Antirrhinum Asarina* is quite a different plant, and is a very charming little thing that deserves to be much grown where conditions are favourable to its well-being. Some of the healthiest and most floriferous plants I have seen were growing on the face of an old stone wall, a position which was evidently exactly to their liking. Being of trailing habit, the stems hung down over the stones, draping them with festoons of soft green, woolly foliage, and for the greater part of the summer goodly numbers of comparatively large creamy flowers with yellow throat were to be found pushing up between the leaves. The latter

sheltered, well drained places it will do well. A point in its favour is that seeds germinate freely, and the young seedlings quickly attain to flowering size.—A. J. MACSELF.

THE CULT OF THE ZINNIA.

TO those unaccustomed to *Zinnias*, disappointment sometimes dogs their footsteps when growing them for the first time. To the uninitiated they are somewhat of an enigma, an annual which gives one the impression that they are robust, when, in reality, they are not; and if planted out too soon are frequently retarded. They love a rich, light soil, and above all a sunny position. I have found they do best when planted out on a wall border having a south aspect. In the summer of 1921, with its weeks of drought, *Zinnias* held their own and bloomed more freely than many other annuals, some of which succumbed. Most people are anxious to complete their garden arrangements before May is out, but one has to remember that it is a month, not infrequently, of extremes of temperature and unless quarters similar to those described can be selected for the plants, it is better to allow them to remain in frames a week or two longer. *Zinnias* continue in bloom longer possibly than any other annual, so that it is unwise to hurry them out of doors before genial weather conditions prevail.—W. L.

[Many *Zinnias* are spoilt each year because the seeds are sown too soon. The *Zinnia* is extraordinarily fast growing and greatly resents being drawn or becoming root-bound. The middle of April is plenty soon enough to sow the seeds and those sown in May quickly form good bushy plants.—Ed.]

GARDENING OF THE WEEK

FOR SOUTHERN GARDENS.

Fruits Under Glass.

Melons.—Where plants were raised early, the fruits will be shewing signs of maturity, and at this stage a slight modification in the treatment is desirable. An excess of moisture, both at the root and in the atmosphere, must be avoided, or the fruits will split and decay at the stalk. On the other hand, excessive dryness, especially at the root will prevent a fine finish to the fruits. A little more top air than is usual will regulate matters fairly well. Plants being grown for succession will need tying to the wires, and the female flowers will require setting when ready. The house should be closed early in the afternoon, the plants well syringed and the floor sprinkled with water. A night temperature of 60° to 65° should be maintained.

Vegetables Under Glass.

Cucumbers are now growing freely and producing fruits in quantity. Prevent overcrowding of the shoots and when the fruits have attained a reasonable size they should be cut or the plants will soon be exhausted. When the roots appear freely on the surface, a top-dressing of fibrous loam and manure from an old mushroom bed may be given. Keep the roots well supplied with water and the atmosphere moist by frequent dampings. The young shoots must be pinched at the second joint. Vapourise the house occasionally in order to keep green and white fly in check.

The Hardy Fruit Garden.

Strawberries.—Plants that have been used for forcing purposes and duly hardened off, may be utilised for making a new plantation in the open ground. The roots must be thoroughly soaked with water a few hours prior to planting and if the foliage is infested with red spider the plants will need a thorough cleansing with some reliable insecticide. The soil should be deeply dug and well manured and the plants set out 2 ft. apart. Give a mulching of manure, and if the weather is dry an occasional watering will be needed until the roots are established. Established beds must be kept free from weeds, and when the fruit is set the plants may be assisted with a little artificial manure. Superphosphate at the rate of 2oz. to the square yard, and watered in, is sometimes given, but a light sprinkling of Thomson's or Le Fruitier is recommended. It ought not to be sprinkled on the foliage or fruit. Spring-planted Strawberries should have their flower trusses removed because it is not advisable to allow them to produce a crop the first year. Cut off all runners, unless a few early plants are required.

The Flower Garden.

Bedding Out.—All plants destined to occupy the flower beds and borders must be gradually hardened off, removing the lights from cold frames both day and night when the weather is favourable. Antirrhinums, if well hardened off may be transferred to their flowering quarters, to be followed by Phlox Drummondii, Stocks, etc. Keep Pelargoniums in the frames until danger of frost is past. May-flowering Tulips have made a bold display and directly they are past their best they may be carefully dug up and placed in lines in the reserve garden or wherever suitable until they have dried off. Daffodils and early-flowering Tulips will be approaching the resting stage and if they are in beds they may be dug up and planted elsewhere or dried off in boxes. Dig over the beds and if the soil is dry, give a thorough soaking a day before planting is contemplated.

Vases and Tubs.—These should be prepared for the summer occupants and both must be provided with ample drainage and filled with a mixture of loam and leaf-mould, with a little manure from an old hot bed. Ivy-leaved Pelargoniums, Fuchsias and Marguerites are excellent plants for these receptacles.

Dahlias.—To secure really fine plants with a wealth of good blooms, the Dahlia must be provided with a moderately rich soil, and where a border is devoted to them it should be manured and dug deeply without further delay. When the plants are put out, protect the young growth from slugs by sprinkling a quantity of soot around each plant. Stakes will be needed and these ought to be in position before the growths fall over. Each shoot will need a separate tie and fairly stout stakes will be necessary. Dahlias may be planted out during this month.

The Kitchen Garden.

Runner Beans.—In every garden and allotment this is a most important crop and now it is quite safe to make an ample sowing. If the ground was dug and liberally manured during the winter months, drills may be drawn 7 ft. or 8 ft. apart and the intervening space cropped with Spinach, Lettuce and Radish. Double drills are usually made about 9 ins. apart, but if this method is not practised a large flat hoe or spade should be used for preparing the drill. Prizewinner and Hackwood Park are two reliable varieties. The French climbing kinds do not require so much space and Tender and True is still a profitable Bean to grow. A further sowing of Canadian Wonder may be made, where dwarf Beans are appreciated.

Peas.—If pods are needed about the middle and end of July a sowing of a main crop variety is advised. The seeds should be placed thinly in a wide drill. The drills ought to be several feet apart, when other dwarf crops can be planted between them. Peas sown early in the season should have been staked and those for succession need similar attention.

Cabbage.—A few lines of plants should be put out directly they are large enough, selecting, if possible, showery weather. A sowing of Coleworts and small-growing Cabbage made now will furnish nice heads late in the year.

Cauliflower.—If the weather is dry afford water to the roots of Cauliflowers. Transfer plants from cold frames to their final quarters.

T. W. BRISCOE

(Gardener to W. R. Lysaght, Esq.),
Castleford, Chapstow, Gloucestershire.

FOR NORTHERN GARDENS.

The Kitchen Garden.

Thinning Crops.—Attention should be paid to the thinning of the different root crops as they become fit to handle, for if this operation is unduly delayed the plants become drawn and weakened, a condition from which they never fully recover. In the case of Carrots, early thinning acts to some extent as a preventive against the carrot fly. Early Turnips need only be partially thinned, as they can be fully thinned by using them when only partly developed. If there are any blanks in the rows of Beet they may be made up by carefully transplanting thinnings.

Potatoes.—Earlies may now be earthed up and if some quick-acting fertiliser is sprinkled alongside the stems it will increase the yield. Maincrop varieties should be forked between the rows soon after they appear above ground.

Tomatoes.—Early crops that have set most of their fruits should continue to receive assistance to swell them by bi-weekly applications of liquid manure of moderate strength. Later crops, whether in glasshouse or frame, should have the laterals pinched out at an early stage, the main stems should be tied in to the stake or string as they advance. Tomatoes require liberal supplies of water. The atmosphere, on the other hand, should be kept rather dry and buoyant.

The Flower Garden.

Half-hardy Annuals.—The sooner these are planted now the greater will be their chance of doing well, as it enables them to get a thorough hold of the soil before the heat of summer sets in. If the soil is rather dry at planting time, the plants should be watered, to settle the soil about the roots.

Bedding Plants.—All other bedding plants should now be fully exposed, but in the event of a late spring frost occurring, protection must be given over night, especially to the more tender plants, such as Dahlias, Begonias and Heliotropes. A sheet of newspaper will ward off any frost that may occur now.

Forsythia suspensa.—This April-flowering shrub produces its flowers on the previous year's wood, so should be pruned promptly after flowering by removing a good proportion of the shoots which have just borne flowers.

Clematises of the Jackmann type which were cut down to about one third of their normal height will now be making rapid growth and should be nailed in or tied in as the shoots develop.

The Hardy Fruit Garden.

Stone Fruits, especially Apricots and Plums, often set far more fruits than they can fully develop or than is desirable from the point of view

of the tree's welfare. In such cases gradual thinning of the fruits should commence at an early stage and should continue until the fruits on an average are from 2 ins. to 4 ins. apart, such advice may not be popular, but practical experience has proved the wisdom of it.

Gooseberries.—Young, partly grown bushes often set heavy crops of fruit, which if left on the bushes would militate against their development. Severe thinning of the fruits must therefore take place. Part of the operation may be delayed until the fruits are fit to pick for tarts, and if at this stage the whole of the remaining fruits can be utilised for cooking, it will be for the future welfare of the bushes if they are entirely cleared of them.

General Work.—The Dutch hoe should be kept going pretty freely among all fruit trees and bushes, for not only does this treatment make for the better aeration of the soil, but it assists in the eradication of pests. If a dry spell occurs, watering may have to be resorted to, especially on light soils, with a porous subsoil. If this attention is not given, especially to stone fruits, dropping of fruits is likely to take place, with more or less arrested development among those remaining on the trees.

CHAS. COMFORT

(Formerly Head-Gardener to Mrs. Haig, Broomfield, Davidson's Mains, Midlothian.)

GREENHOUSE AND CONSERVATORY.

Pimeleas are beautiful greenhouse shrubs, the best known species being *P. spectabilis*, *ligustrina*, *Gnidia*, *ferruginea* and *rosea*. These may be planted out in a well drained border in the cool conservatory, where they will flower during April and May. The flowers are produced on the tips of the shoots made the previous year. After flowering the shoots should be partly shortened back. *P. ferruginea* (syn. *P. decussata*) is the best species for pot cultivation, as it is naturally of a close, compact habit, and produces its rosy red flowers in wonderful profusion. This plant flowers freely when quite young, but at this stage the blooms should be pinched off to induce the plant to make plenty of growth. Pimeleas are easily propagated at this time by means of the young twiggy shoots, selecting cuttings about 2 ins. in length and dibbling them into pots containing sandy peat. Stand the pots under bell glasses in a cool greenhouse. When rooted the young plants should be potted off into small pots containing a compost of sandy peat. As the plants get larger a little light loam may be added to the potting compost. Pimeleas are free rooting plants and require plenty of water at the root when growing freely.

Philesia buxifolia is a pretty plant which bears small lapageria-like flowers, but unlike the Lapageria it makes a small compact bush. It is a native of Chili and is hardy in Ireland and in favoured situations in the south-west. In the colder parts of the country it requires cool greenhouse treatment, and like the Lapageria requires cool, moist conditions. This plant enjoys a compost of rough fibrous peat and sand, with the addition of a little good fibrous loam. Like the Lapageria it should be increased by means of layers or by the suckers which it sends up from the base. Fine specimens may be grown in pots, but this plant requires less attention when planted out in a cool position in the conservatory.

Philageria Veitchii is a hybrid between *Philesia* and *Lapageria* and is intermediate in habit between the two parents. This plant has never been common in gardens and I doubt if there are many plants in cultivation at the present day.

Mitraria coccinea is a native of Chili and likes cool, moist conditions. It is hardy in west-country gardens, but in the colder parts of the country requires to be grown indoors. It is seen at its best when planted out in a cool conservatory in a well drained bed in a compost consisting of sandy peat, with the addition of a little light loam. It is of a somewhat scandent habit and should be kept neatly tied up to stakes. Grown in pots it makes a neat, compact bushy plant and is best given a cool, partially shaded position. It is easily propagated by means of cuttings any time during spring or summer, the cuttings rooting readily in sandy peat in a close case in a cool house.

Sarmienta repens is a plant which likes cool, moist conditions. It is a slender, creeping plant and is best grown in a pan or orchid basket in a compost of soft, fibrous peat, mixed with Sphagnum, sand and charcoal. It succeeds best when kept well up to the roof glass in a partially shaded position in a cool, moist house. It is a very dainty little plant and is worth some trouble to grow successfully. It is propagated by means of cuttings.

PLANT PESTS AND PARASITES.—A useful
booklet on garden troubles by HORACE J. WRIGHT is to be
obtained from the Offices of "COUNTRY LIFE," LIMITED, 20,
Ravistock Street, W.C.2; 11d., post free.

Coleus thrysoides is undoubtedly one of the finest blue-flowered plants that we have for flowering in the greenhouse during the winter. If large specimens are required a start should now be made to propagate plants either by means of seed or cuttings. Next month will be quite soon enough to propagate smaller plants for the stages. Cuttings root easily in a close propagating case with slight bottom heat. In its earlier stages this plant enjoys an intermediate temperature, giving it slightly cooler treatment as the season advances. This plant should be given generous treatment and large specimens will require to be grown on into eight and ten-inch pots. One cannot say that this plant is easy to grow, as sometimes it lulls for no apparent reason. Watering should be done carefully, and the plant seems very susceptible to sudden changes of temperature, and sometimes moving it from one house to another is enough to give it a check. In its younger stages it should be pinched several times to induce a bushy habit. J. CUTTIS.

Royal Botanic Gardens, Kew.

OBITUARY

J. W. M'HATTIE.

WE regret to record the sudden death of Mr. John Wilson M'Hattie, superintendent of Edinburgh City Parks, which took place on Sunday, April 29. Mr. M'Hattie had been in ill-health for some time, but latterly seemed quite recovered and was attending to his usual duties the week before his death. He rose as usual on the Sunday morning, but soon after collapsed and expired. His death is much felt by the people of Edinburgh. He was for long a prominent man in Scottish and other horticultural affairs. He had been for about thirty years superintendent of Edinburgh Parks, and previous to his appointment was gardener to the Marquis of Lothian at Newbattle Abbey, having previously been in some important appointments in the south, including those of gardener to the Duke of Wellington and Mr. Whitaker Wright. A native of Banffshire, where he was born about sixty-five years ago, Mr. M'Hattie has had a career of note in horticulture, and was held in high respect by all with whom he came in contact in the exercise of his duties and in the various horticultural movements in

which he was interested. He did yeoman service for the Royal Caledonian and other horticultural societies, and his unflinching courtesy and kindness made him much esteemed. Although Mr. M'Hattie was so shortly to retire, his passing away so suddenly has cast a gloom upon the city in which he was so deservedly held in such high esteem. Much sympathy is felt for Mrs. M'Hattie in her great loss. His only child, a son, predeceased him.

A Pretty Alpine. Though a lowly and familiar plant, *Hutchinsia alpina* (*Noceca alpina*) must take high rank among alpine crucifers, for its white flowers are of a quality and texture not common in its tribe, and few are more attractive when sheeting some cool, half-shady place in which this species loves to grow. Ease of culture is also a recommendation that can be claimed by *H. alpina*, and the rich glossy green of its mats of minute leaves affords the best possible background for its broad milk-white flower-heads. These latter, appearing in April and continuing throughout the spring, are held on slender 3m. stems, but there is another member of the genus, *H. brevicaulis*, in which the stems are so short that the flowers scarcely rise above the foliage. This is no less delightful a plant for such situation as the above, and the tiny leafage, differing slightly in structure from that of *alpina*, is glossed with an iron-blue polish which makes the whiteness of the comparatively large flowers even more striking.

A Useful Carpeter. For covering the ground between shrubs, for holding in place the crumbling soil of dry banks, for wall culture and associating with Ferns and other woodland plants there is much to be said on behalf of the common *Waldsteina trifolia*. The three-fold leaves of this carpeter are a rich green throughout the year, but the young foliage and fresh runners which are put out in early spring are a glossy bronze tinted with red. These are soon followed by orange-yellow blossoms about the size of Buttercups, a succession of which is maintained the greater part of the season. Though a free and robust grower that will fend for itself almost

anywhere in sun or shade, *W. trifolia* need never be a nuisance and can easily be rooted out when it is no longer wanted.

A Beautiful Anemone.—One of the most delightful and distinct of its race is *Anemone narcissiflora*, a lover of cool, half-shady place in garden or woodland. Early in the spring sends up to the height of rather less than a foot an elegant cluster of very silky, deeply cut leaves which might be taken to be those of some hard Geranium. In the centre of this soft green ruff the flowers appear in April or later, and they half a dozen or more in number, are saucer-shaped and of an exquisite apple blossom pink and white. This charming Anemone is liable to disappear during winter in cold, ill-drained soils, but given a free-rooting medium with some leaf-mould or chopped turves, it will prove long-lived and indeed, increase in beauty year by year for many seasons. There are several forms of this plant, one with a single flower to the stem and other which show differences in the form and hairiness of the foliage, but none of them is common.

Ranunculus aconitifolius.—Though an old plant, this is not seen in gardens as often as might be, for it is of the easiest culture in a fairly good border soil that is not too dry, and is as beautiful in foliage as it is in flower. A herbaceous species, it appears in early spring and makes a bold clump some 18ins. high of rude angular stems and smooth deeply divided leaves. These are followed (April-May) by a galaxy of white blossoms about 1in. across of remarkable purity and elegance. There is a double for our old friend "Fair Maids of France," Bachelor's Buttons, in which the blossoms are each congested into tight little wads of white which are not comparable to those of the type where beauty of form is a consideration, though they may last longer. This double variety nevertheless, the one more commonly seen in cultivation.

Kew Guild.—The annual general meeting will be held at the Imperial Hotel, Russell Square, W.C.1, on Wednesday, May 30, at 6.30 p.m. The president-elect of the Guild, Mr. John Master Hulmer, will preside at the annual dinner, following the general meeting, at 7.15 p.m.

The Ghent International Exhibition. Further reports which have come to hand as to the above exhibition shew that the breakdown in the arrangements for the supply of suitable stone not only put the English nurserymen who were exhibiting rock gardens to very considerable inconvenience, but very much minimised the effectiveness of the display. Mr. Whiteleg exhibit has already been mentioned, but Messrs. T. R. Hayes and Son of the Lake District Nursery also had a very creditable exhibit which overruled the proper stone to have shewn the many visitors to the exhibition what English firms can do in the way of rock gardens. Spring-flowering Heaths, Encrusted Saxifrages, Candelabra Primulas and *Azalea roseiflora* were some of the most effective plants employed, and these were associated with suitable dwarf conifers. The neatest of Mossy Saxifrages, too, *S. muscoides atropurpurea*, was very attractively shewn.

The "ATCO" Turf Cultivator aerates roots, destroys plantains, daisies, etc., levels turf, loosens and collects moss, makes coarse grass fine. It can be affixed only to the "ATCO."

The most efficient Mower on Earth

DURING the mowing Seasons of 1921-22-23 the British public invested £262,500 in the purchase of 3,500 "ATCO" Motor Mowers. Prior to that period the majority of mowing was done by hand or horse mowers at a cost per annum sufficient to pay for an "ATCO" outright. Of these 3,500 "ATCO" owners not one, to our knowledge, has met with a mowing difficulty to which the "ATCO" is not equal.

THE "ATCO" LAWN EDGE TRIMMER

works with great speed and simplicity, giving a straight edge by the actual continuous "shears" action. Its efficiency and reliability have been perfected in actual use under all normal conditions.

PRICE:
57/6
delivered.

One owner writes that mowing which employed a gardener two full days is now done more efficiently in five hours with the "ATCO." At Cheddle Hulme an "ATCO" has just completed its second season without a single breakdown and without the owner having to spend a penny piece. A gardener with sufficient mowing to occupy a man and a boy six days with a push mower, now does the whole of his work in two days on less than a gallon of Petrol Mixture.

Send for Free Booklet offering FREE DEMONSTRATION on your own grass, and telling how the "ATCO" pays for itself in a year.

PRICES: 16 in. £50. 22 in. £75. 30 in. £95.
Less 5% Cash, 7 days. Cultivator extra.

BENSON'S GARDEN HOSE

SPECIAL 1923 OFFER.

All Hose is made 60ft. lengths. **BEST HAND-MADE GARDEN HOSE**, 60ft. best Red or Grey ¾, with all best Brass Fittings, 18/6 COMPLETE. This is Hose much superior to the common drab quality usually sold.

"SPECIAL RED" or GREY HOSE.

60ft. ¾ in., fitted with Branch Rose and Jet and Royle's pattern Tap Union, 22/6
60ft. ¾ in., " " " " " " " " 26/6
60ft. ¾ in., " " " " " " " " 32/9

This Hose is very superior, both in make and finish, to anything of the kind hitherto made. The rubber inside is seamless, thus avoiding the possibility of splitting or opening of seams which occurs with the ordinary make; also, being well frictioned on to the canvas during the process of manufacture, it is not liable to peel off. It is calculated to stand much greater pressure than the ordinary Hose, combining lightness with strength.

FERTILISE FREELY!

Fertilise freely or all your
labours in the garden will be
wasted. Plants must have
Nitrogen, and the best form
is Nitrate of Soda in conjunc-
tion with phosphates and
potash.

Write for pamphlets, entitled, "Successful
Gardens for Every Amateur," "The Manur-
ing of Orchards and Fruit Trees," supplied
gratis and post free by **THE CHILEAN**
NITRATE COMMITTEE, Friars House,
New Broad Street, London, E.C. 2.

Nitrate of Soda

Why Shouldn't Your Garden?

Why shouldn't your
garden be a magnifi-
cent display? Why
shouldn't it? It
should—it can be.

Plants want nourishment. If your flowers
and fruit and vegetables haven't come up
to your expectations, it is because the soil
wants enriching with **ECLIPSE Fish Manure**.
ECLIPSE Fish Manure supplies the essential prop-
erties which the soil needs to produce rich blooms in
profusion, bumper crops of fruit and vegetables.

ECLIPSE Fish Manure contains
Phosphates, Nitrogen and Potash
in their proper proportions. Being
largely organic, it supplies humus
to the soil.

STRONG PLANTS FOR BORDERS, BEDS, ROCK-ERIES, ETC., will flower this year and improve every year. **Achillea**, double white, 4 for 1/4; **Kelway's Crimson**, 3, 1/6. **Agrostemma**, crimson, 6, 1/6. **Alyssum Gold Dust**, 12, 1/6; **montanum**, rare alpine, 3, 1/6. **Alpine Pinks**, white or pink, creeping, 4, 1/4; mixed colours, 6, 1/4. **Anchusa Dropmore**, blue, 4, 1/4. **Aströmmeria** (Peruvian Lily), 3, 1/6. **Alpine Wallflowers**, dwarf, summer flowering, bright yellow, golden and mauve for borders, old walls, rockeries, etc., 12, 1/4. **Antirrhinums**, autumn sown, transplanted, bushy plants, all the new colours, separate or mixed, 12, 3/-; autumn sown, not transplanted, mixed, 12, 1/6. **Anemone japonica**, pink or white, 3, 1/6. **Anthemis** Kelwayi grandiflora, golden, 4, 1/4. **Aquilegia**, Kelway's hybrids, 6, 1/4. **Aubretia**, rich purple, 6, 1/4. **Auricula alpina**, 4, 1/6. **Aster** (Michaelmas Daisy), best large-flowering, Beauty of Colwall, Perry's White, Climax, Nancy Ballard, Ella, etc., 2, 1/4.

Brompton Stocks, year old, transplanted, 6, 1/6; not transplanted, 12, 1/6.

Campanulas, dwarf, for rockeries, etc., or tall, for borders, etc., blue or white, 3, 1/6. **Campanula glomerata**, heads, purple, 2, 1/6. **Campanula macrantha**, large mauve, 4, 1/4. **Campanula pyramidalis**, chimney bell flower, blue or white, two years old, 3, 1/6. **Canterbury Bells**, large year old plants, double, white, blue, pink, 6, 1/6; single, white, blue, mauve, pink, 12, 1/9. **Candytuft**, perennial, 3, 1/6. **Carnation** Grenadin, brilliant scarlet, 6, 1/9; Margaret, fine new type, crimson, scarlet, white, yellow grounds, 6, 1/9; good border, mixed doubles, 6, 1/6. **Catmint** (Nepeta), mauve, 4, 1/4. **Cerastium**, 6, 1/4. **Cheiranthus** (Siberian Wallflower), yellow, golden, mauve, 12, 1/4. **Chelone** (Lobster Flower), coral red, 4, 1/4. **Christmas Roses**, large roots, 1, 1/4. **Chrysanthemum**, all colours, early, mid or late, 6, 1/9. **Chrysanthemum** maximum, single hardy white Marguerite Daisies, very large blooms, Mrs. Lothian Bell, King Edward, Californica, Market Favourite, etc., 6, 1/6. **Chinese Pinks**, double and single, 6, 1/4. **Cistus** (Rock Roses), lovely colours, charming for rockeries or border, 6, 1/6. **Commelina celestis**, heavenly blue, 3, 1/6. **Cornflowers**, Kelway's blue, 12, 1/6.

Daisies, Monstrosa, intensely double enormous blooms, pink, white or crimson quilled, 12, 1/4; mixed, 20, 1/6. **Dianthus**, best named varieties and lovely hybrids, 1 year old, 3, 1/6; 2 years, 9d. each; 3 years, 1/- each. **Dianthus**, charming bedder, double or single, all colours, mixed or separate, 12, 1/9. **Dianthus Lucifer**, intense orange scarlet, double, 6, 1/6; Heddevegi, chionensis, imperialis, laciniatus, equal to good Carnations, 12, 1/9. **Dianthus**, rockery, Cheddar Pink, cruentus (blood red), deltoideus (creeping, bright pink), 6, 1/6.

Erigeron Mauve Marguerite, 4, 1/4. **Erigeron** Quakeress, 3, 1/6. **Erysimum** Golden Gem, 20, 1/6. **Evening Primrose** Atterglow, large yellow, medium, 4, 1/4.

Forget-me-nots, best dwarf, blue, 20, 1/6. **Foxgloves** (purple), 12, 1/6; gloxinia-flowered, 6, 1/4; yellow (grandiflora), 6, 1/6; white, 6, 1/4; ivory spotted, 12, 1/9.

Francoa (Bridal Wreath), 3, 1/6. **French Honeysuckle**, red flowers, 4, 1/4. **Fuchsia**, hardy Crimson Bush, 3, 1/6. **Funkia** (Cortin Lily), white scented, 2, 1/4.

Gaillardia grandiflora, 6, 1/6. **Galega**, mauve or white, 6, 1/6. **Geum** Mrs. Bradshaw, large double scarlet, 2 and 3 year old plants, 1/- each; Glory, fine double scarlet, 3, 1/6; coccineum, semi-double, bright scarlet, 4, 1/4. **Gypsophila paniculata**, 4, 1/4; glabrata, dwarf for rockeries, 12, 1/9.

Helianthemum (Sun Roses), bright colours, 4, 1/4. **Hemerocallis**, hardy Lily, large yellow, orange and tawny blooms, 3, 1/6; new double orange red, 2, 1/6. **Hollyhocks**, Kelway's double, 3, 1/6; single, 4, 1/4. **Hydrangea paniculata**, enormous heads bloom, quite hardy, large plants, 1/4 each. **Hypericum** (St. John's Wort), 4, 1/4.

Iceland Poppies, Excelsior strain, 6, 1/6. **Incarvillea**, large bell-shaped flowers, 3, 1/6. **Indian Pinks**, various colours 6, 1/4. **Inula glandulosa**, large, golden yellow, 3, 1/6. **Iris**, Japanese, large flowers, 3, 1/6; large flag, splendid large-flowering, white, mauve, yellow, blue, purple, separate, 3, 1/6; mixed, 4, 1/6; hispanica (Poor Man's Orchid), 6, 1/4.

Kniphofia (Torch Lily), tall orange scarlet, 3, 1/6.

Lilies, hardy Tiger, double or single, 3, 1/6. **Linum** perenne, blue Flax, 6, 1/6. **Linaria dalmatica**, spikes yellow, blotched red, 6, 1/6. **Lobelia cardinalis**, spikes rich scarlet, 4, 1/4. **Lupin**, Tree, yellow or white, 3, 1/6; polyphyllus, large spikes, blue, white, etc., 6, 1/4; pink flowering, 1, 1/4. **Lychnis chalcedonica**, scarlet or Salmon Queen, 3, 1/6; coronaria, silvery foliage, crimson flowers, 6, 1/6.

Malva moschata, pink or white, 4, 1/4. **Mimulus cardinalis**, hardy scarlet Musk, 4, 1/4. **Montbretias**, spikes, brilliant colours, 12, 1/9.

Pansies, best large-flowering exhibition varieties, 12, 1/6; separate colours for bedding, blue, white, yellow, red, purple, mauve, golden, 12, 1/6. **Papaver**, Oriental and Salmon Queen, 3, 1/6; orientale, crimson and scarlet, 6, 1/6. **Pentstemon**, large scarlet Southgate Gem, Middleton Gem and large Excelsior strain, 3, 1/6; gentianoides, blue shades, 6, 1/6.

Pulmonaria, Jerusalem blue Cowslip, rare, large plants, 1/- each. **Physalis**, giant Chinese Lantern, 6, 1/6. **Pinks**, old-fashioned fragrant double white, 6, 1/6; Mrs. Shirkins, 3, 1/6; double, semi-double and single, all colours, fragrant 12, 1/9.

Potentilla, 4, 1/4. **Primulas**, lovely hardy varieties for borders, rockeries, bogs, assorted, 4, 1/4. **Polyanthus**, best large flowering, 6, 1/4. **Primrose**, blue and purple shades, 6, 1/6. **Primula denticulata**, lilac; rosen, bright pink; cortusoides, rosy purple; japonica, rich colours; cashueriana, purple; pulverulenta, rich crimson flowers; skinkunensis (Himalayan Cowslip), fragrant yellow flowers, 3, 1/6. **Phlox**, large flowering, best named, all colours, 3, 1/6; **Pyrethrum**, Kelway's hybrids, 4, 1/6. **Perennial Sunflowers**, 6, 1/6. **Pyrethrum**, double pink, white, crimson, large clumps, 2, 1/6; James Kelway, large scarlet, 2, 1/4.

Rock Roses, trails bright flowers, 6, 1/6. **Rose Campion**, bright crimson, 6, 1/6. **Rudbeckia** Newmanii speciosa, 3, 1/6.

Salvia argentea, silvery leaves in large rosettes, white flowers, 4, 1/4. **Saponaria**, trailing pink flowers, 6, 1/6. **Sweet Scabious**, lovely colours, dwarf or tall, 6, 1/4. **Scabiosa caucasica**, large, exquisite mauve flowers, one year old, 3, 1/6. **Shasta Daisy**, 4, 1/4. **Sedums**, 4, 1/4. **Silene**, pink, compact, 12, 1/6. **Solidago** Golden, 3, 1/6. **Solomon's Seal**, 6, 1/6. **Sweet William**, new Scarlet, Pink and Crimson Beauty, 6, 1/4; double white, 6, 1/4; double and single hybrids, 12, 1/6. **Thalictrum**, hardy Maidenhair, 3, 1/6. **Tritoma** (Red-hot Poker), 3, 1/6. **Tussilago** (Winter Heliotrope), 3, 1/6. **Tunica Saxifraga**, dwarf, edging or rockery, 6, 1/6.

Verbascum, tall, yellow, 3, 1/6. **Valerian**, crimson, 6, 1/6. **Veronica spicata**, tall blue, 4, 1/4; gentianoides, dwarf blue, 4, 1/4. **Viola cornuta**, masses of small blooms, lovely for rockeries, etc., Mauve and Purple Queen, White and Blue Perfection, 12, 1/9. **Violas** from seed, Bath's bedding, yellow, white, purple, blue and mixed (all colours), 12, 1/6; good bedding, mauve, from seed, 12, 1/10; from cuttings, best large mauve, yellow and white, 12, 2/6.

STRONG TRANSPLANTED GREENHOUSE AND SUMMER BEDDING. **Agapanthus**, blue African Lily, two year old, 2, 1/4. **Agatha**, blue Marguerite, 6, 1/6. **Aralia** (Fig Palm), 3, 1/6. **Arum Lily**, one year, 3, 1/6. **Asparagus Fern**, erect or trailing, 3, 1/6. **Asters**, double or single, 12, 1/-; **Ageratum**, blue, 12, 1/-; **Balsams**, double, 12, 1/4. **Begonias**, evergreen, perpetual flowering, 4, 1/4. **Beauty Stocks**, fragrant, 6, 1/6. **Cannas**, Crozy's hybrids, strong two year old, 3, 1/6. **Celsia cretica**, spikes yellow and mauve, 4, 1/4. **Clarkia**, 12, 1/4. **Cobaea scandens**, handsome, rapid climber, large purple flowers, 3, 1/6. **Cyclamen**, choice climber, large purple flowers, 3, 1/6. **Collarette**, Colossal strain, 3, 1/6. **Dahlias**, Peony-flowered, Colliette, Colossal, single, Cactus, double, etc., 4, 1/4. **Deutzia gracilis**, 1 for 1/4. **Echeveria**, glaucous rosettes trailing red flowers, 4, 1/4. **Eucalyptus** (Blue Gum), 4, 1/4. **Fuchsias**, choice sorts, 4, 1/8. **Francoa** (Bridal Wreath), 4, 1/4. **Gloxinias**, large erect blooming, lovely colours, 2, 1/4. **Heliotrope** (Cherry Pie), 3, 1/6; bedding, 4, 1/4. **Heliotrope** regale, enormous heads of bloom, 4, 1/4. **Ivy Geraniums**, double pink, 3, 1/6. **Larkspur**, 12, 1/4. **Lobelia cardinalis** Queen Victoria, daret foliage, spikes scarlet flowers, 3, 1/6. **Lobelia**, rooted cuttings, best blue, 20, 1/6. **Marguerite** Covent Garden White and large yellow and sulphur, 4, 1/4. **Nemesia**, 12, 1/-; **Nicotiana**, white or crimson, fragrant Tobacco, 4, 1/4. **Passion Flower**, 2, 1/6. **Pentstemon**, grand bedders, 6, 1/6. **Plumbago**, blue, 1, 1/4. **Primula obconica**, new giant, lovely colour, 3, 1/6; Kewensis, yellow, 4, 1/4. **Rehmannia**, large pink trumpet flower, greenhouse perennial, 3, 1/6. **Salvia coccinea**, scarlet, 4, 1/4. **Saxifrage** Mother of Thousands, 4, 1/4. **Schizanthus**, new hybrids, 12, 1/6; Pink Pearl, 6, 1/4. **Smilax**, trailing, 4, 1/4. **Streptocarpus** (Cape Primrose), new hybrids, 3, 1/6. **Stocks** (Ten Week), 12, 1/4. **Sweet Peas**, 20, 1/6. **Verbenas**, 12, 1/4. **Zinnias**, 12, 1/4.

Tomato, strong transplanted, best varieties, 6, 1/6.

STRONG VEGETABLE AND HERB PLANTS from open ground. **Asparagus**, Kelway's Giant, two year old roots, 7/- 100; three years, 10/- 100. **Sage**, **Thyme**, **Mint**, **Marjoram**, 3/- doz. **Parsley**, best curled, 1/4 doz. **Spring Cabbage**, **Brussels Sprouts**, **Cos** and **Cabbage Lettuce**, **Leeks**, **Cauliflower**, **Winter Tripoli Onions**, **Pickling Cabbage**, 1/9 100.

STRONG HARDY CLIMBERS. **Ampelopsis** Veitchii, self-climbing, small leaf, large roots, 2/- each. **Honeysuckle**, very fine red-flowering Dutch, large plants, 3/- each. **Wistaria sinensis**, large racemes of bluish-lilac flowers, 3/6 each. **Apios**, tuberous rooted Wistaria (not sinensis), rapid climber, sweetly scented purple flowers, 3, 1/6. **Calystegia**, double pink Morning Glory, 3, 1/6. **Passion Flower**, hardy blue and white, 1, 1/4. **Tropaeolum speciosum**, flame flowers, 2, 1/6. **Jasmine**, fragrant white flowering two year rooted cuttings, 1/- each; very rare yellow summer-flowering, 1/4 each; yellow winter-flowering, 2, 1/9. **Ecceimocarpus**, trusses orange-red flowers, 2, 1/4.

Notes from Maidstone.

THE CALL of SPRING

At no time is the call of
the garden more clamant
than in those lengthening
days when April turns to
May. The weevil now
leaves his watery nest
and turns to seek his
mate: the aphid, long
immured in her dark egg,
creeps out to fulfil urgent
domestic calls.

But what is life to the
weevil is death to the
fruit & death's avenging
hand may not be stayed.

Timely advice on such
letal matters is con-
tained in our pamphlet
on Pests of Orchard and
Garden Crops—1d. post
free.

[MAY 19, 1923.]

SOME GEMS OF THE ROCK GARDEN

THE period which may be said to synchronise with the flowering of most of the Mossy Saxifrages and the gradual awakening of the Encrusted ones—this year about mid-April with us—is one of the most interesting of the rock gardener's year. Yet its peculiar attractiveness does not, to my mind, arise from the fact that during that period those same Mossy Saxifrages make so brilliant a show, nor yet because it is at that time the gallant Aubrietias have made such wonderful masses of colour. Those few weeks are most precious because it is during them that so many of one's favourite plants come into flower.

These may not be among the newer things; often they are comparatively common. Nor are they, as I have suggested, always the most colourful of their time. A good many of them are simply well tried, faithful friends, as often as not having a quiet fascination which is beyond analysis, as it is certainly beyond the comprehension of those non-gardening, but quite polite, visitors who would, you feel sure, be so much happier at the Crystal Palace among the scarlet Geraniums and cement than studying the unfolding of *Vancouveria hexandra*.

Always to be counted among the elect is little *Erodium chamaedryoides* (Reichardti) from the Balearic Islands. There is something inexpressibly sweet about the cold white flowers and dark green leaves of this tiny treasure, something which has not been imperilled in the least degree by the arrival of the much rarer pink form (rosea) now a-bloom close by it. *E. chrysanthum* is another April bloomer in this genus which is by no means a showy plant. Yet there is an elegance in the lax and drooping flowers of pale primrose yellow that is not less charming than the exquisite delicacy and softness

of the silvery leafage. *Androsace Lagerri*, one of the forerunners of its race, must also be mentioned. If it is not a very free bloomer here, there is a satisfaction in the few stems which rise above its cushion of lively green, each bearing its rosy pink bell, which is not always vouchsafed by plants of bolder ambitions. Also after its kind, but more glaucous of foliage, is *Douglasia* (*Androsace*) *Vitaliana*, which yields but shyly on short, slender stems in early April its lovely citron-yellow blossoms.

Alsine (*Arenaria*) *laricifolia* also succeeds in winning its way into one's select list, not perhaps for any special beauty in colour or form, but probably because of its irrepressible cheerfulness, for it breaks out into the sappiest of grassy greens before most things have heard the call of spring, and flops over the rock face with a heartiness of some lusty weed, just in time to open its white flowers to April's most genial hours. Very different is *Silene acaulis*, albeit a gem of the first water. There are some happy people who are said to have been satiated with the loveliness of its pink-starred carpets on alpine heights—others, possibly

no less happy, will frankly tell you the thing is not worth fourpence and that to admire it is merely a form of madness. To me it recalls some good days on the stony ribs of the Rockies, and there are many things in the April rock garden less worth looking for than those wee red crosses on their pads of moss. But as their colour is not a fast dye you must see them before the sun has stolen their flush of youth.

Arenaria montana cannot be praised too highly. It is so content to make its own way, to fit itself in with whatsoever it happens to have seeded among that it remains one of the most cherished objects of the spring garden. The form known as *A. m. grandiflora* is much the best, and whether this has claimed the companionship of Heaths, creeping *Cotoneasters* or native Ferns, mounting their branches or fronds like a climber, or whether its milk-white moons are lying in garlands amid the glorious purple of *Viola gracilis* it is equally charming. Not less independent by nature, and certainly not less lovely, is the double *Lady's Smock*, *Cardamine pratensis*, which will bring to any cool place its generous drifts of clear lilac and perpetuate itself by leaf-layers for ever.

Of quite a different temperament is the entrancing *Mertensia primuloides* with its forget-me-nots of velvety violet and turquoise and old gold. But if this, like its bewitching sister *virginica*, is inclined to think our garden treatment hardly worthy of such a priceless gem, we can at least be grateful for such flower spikes as it is willing to unfurl, without the necessity of inflicting upon it or ourselves the deception of an artificial moraine.

Veronica satureioides is a very prostrate, carpeting species of woody growth and leathery leaves, which justly can claim a place among the chosen. The fuzzy little cones

THE SPLENDID GENTIANELLA, GENTIANA GENTIANELLA.

THE ADMIRABLE WHITE FORM OF *VIOLA GRACILIS*.A CHARMING WOOD-SORREL, *OXALIS ENNEAPHYLLA*.*PHLOX SUBULATA LILACINA* (G. F. WILSON).

of pale purple, speckled with crimson anthers, it presents like a patch of rich colour among certain of the more lowly Sedums and other things of not too hot a slope. *S. Nevii* is one of the choicest of these and it is now breaking into flower with the larger *S. ternatum* and the almost shrubby *S. confusum*, which holds aloft its bold heads of gold. Harebells, also, is a very lovely little annual *Veronica*, not more than 2 ins. high, with large Speedwell blossoms, 1 in. across, in a most intense lobelia blue with a white eye. This delightful stray arrives every April, to come up in all sorts of unexpected places, in masses and singly. It is especially attractive among the Sedums and has a partiality for seeding among some dwarf and rather sparse carpets of *Aubrietias variegata aurea* and *argentea*, which seldom have many flowers of their own. Two more *Veronicas* which claim notice here are *V. pectinata*, whose large bright blossoms, in both blue and pink, are now beginning to adorn its drifts of downy verdure, and *V. cinerea*, with flowers of a luminous pale blue on a foliage of ashen grey.

Among the many Alpine *Phloxes* one is half fearful of doing an injustice to those which do not deserve it, by leaving them unnamed while making special allusion to the favourites of the hour. These latter must include *P. subulata*, "G. F. Wilson," unsurpassed in the cold electric blue of its generous flowers, the wonderful little "Vivid" and the snow-white "Nelsoni" (hybrid). Then there is the downy, trailing species, *P. verna* (reptans or stolonifera) in a very fresh rose-carmine, and the frail but erect *P. amana*, with very large drooping blossoms of a bold rosy lilac. There are others, as I have said, lots of them, which might justly claim inclusion here, but of those now in flower I think I have selected the most appealing.

Gentiana Gentianella, still one of the most strikingly beautiful of its race, retains its hold upon one's affections despite the crush of rivals. But its trumpets are so big, so bold and so blue that they never, when the plants are grown alone, seem to give the effect that one feels they ought to give. For example, we have one planting of this *Gentian* with which was incorporated a quantity of spring Crocuses and another in which the plants are the sole occupants of the place allotted to them. Now the former, in which nearly 300 fully expanded blossoms have just been counted, is incomparably more satisfying, with the splendid velvety-blue flowers standing amid the arching "grass" of the Crocuses, than those others which have the plot to themselves. Incidentally, I may add that some clumps of *G. verna* which were simply "stuck-in" near these *Gentianellas*, the poor, stony soil having had no special preparation, are crowded with magnificent blooms, while those in a bed most carefully prepared for them are puny and miserable!

Though my space is running-out, there are still more claimants for this list. *Dryas octopetala* is one of these and no better rock plant was ever introduced. For years we were unable to satisfy this hardy alpine, but since it has been abandoned to the mercy of encroaching companions—*Thymes*, *Hypericums* and what not—it has gone ahead with the utmost heartiness. However, there are good and bad forms of this pretty trailer, just as there are of the superbly beautiful *Oxalis florbunda* which is yet another of one's indispensables. A bold clump of this latter about a foot high and as much across, with flowers nearly an inch in diameter, all shimmering like rosy red satin in the noonday sun, is an object worth living for. The little pink Wood Sorrel (*O. Acetosella rosea*) is also one of those plants which one would miss at this season. As for *O. enneaphylla rosea*, we have not yet been able to realise Mr. Clarence Elliott's appreciation

(page 196) of it since it is evident we have not got the really rosy form of that excellent plant. That being so, I must plump for *O. adenophylla*, with the dark crimson-purple eye, a flower of the rarest beauty and of which the unfolding leafage is even

more quaintly pretty than that of *O. encephylla*, though both are modelled on the same pattern. *O. encephylla*, I may add incidentally, spreads rapidly in this garden, a characteristic which, as Mr. Elliott says, is not common. A. T. JONSSON.

A SELECTION OF DWARF SPRING-FLOWERING SHRUBS

TWO little shrubs in the rock garden are mainly responsible for this contribution, one being *Berberis Irwinii* and the other *Cytisus Ardoini*. The former is one of the *B. stenophylla* hybrids and might be fairly described as a minute *Darwinii*. In leaf and bud and flower it closely resembles that gorgeous species, and that I think will be recommendation enough for most people. A specimen we have had for some years has not yet attained the height of gins, and every April its somewhat drooping branchlets are heavily clustered with their large orange-yellow blossoms. An ideal shrub for a ledge on the level of one's eye. As for *C. Ardoini*, the intense golden-yellow of the fragrant flowers which throng its 6in. stems is one of the most conspicuous patches of colour in the spring garden. This hearty bushling delights in any dry, sunny spot.

From *C. Ardoini*, crossed with the White Spanish Broom, came the elegant *C. kewensis*, whose lax and trailing stems, bearing ivory-white flowers, often larger than those of either of its parents, do not rise more than a few inches above the soil or rock face. Yet another for which we have, in part, to thank *C. Ardoini* is *C. Beani*, the slender, whippy shoots of which are more erect than those of *C. kewensis*, as their flowers are more golden. *C. decumbens* is also a first-rate dwarf shrub, one that will hug the surface of a rock with a veil of wiry green branches which blaze into yellow before the spring is half-way over.

Genista hispanica's glowing mounds of colour, often as symmetrical as an old-time beehive, are always welcome. This is a lowlier, more compact and refined plant than *G. germanica*, which comes on later, and it provides us with a very diminutive form which has its uses in large gardens no less than in small. Though *G. anglica* and *tinctoria*, both natives, are sometimes not seen in flower until full summer, they often give colour much earlier and this year we have them out in May. The former is, perhaps, most generally adaptable for associating with the lesser Heaths, but the double form of *G. tinctoria* is a really attractive little rock plant with an almost prostrate habit and a dense mass of dark glossy-green foliage. It is curious to note how the tips of the old shoots in this *Genista* are leafless and hardened almost to a spike, this giving the plant a bristly appearance. From which we may assume that a thousand years hence *G. tinctoria* will be armed with a formidable array of spines and that unless the epidermis of the rabbit's nose has by that time also been evolutionised so as to enable it to attack the tender shoots which hide behind those defences, the said rodent will perforce have to seek other fare. *G. anglica*, the Needle Furze, has already wisely averted extinction in the manner suggested.

However, this is by the way. *G. sagittalis* may be omitted from a select list, which promises to be too long for one's space, and *G. pilosa* and *radiata* may also be excluded, but with more regret. I suppose most people would not hesitate to give *Daphne Cneorum* a foremost, if not the first, place among the dwarf shrubs of the April-May rock garden and I would not quarrel with their choice.

For where a bold, pure colour, refinement, grace and a delicious fragrance are desired in combination, *D. Cneorum* will give them in abundance. This glorious plant, we are happy to say, grows with the utmost freedom in our light loam, yet it is one of the most disheartening plants imaginable in the gardens of a neighbour whose conditions

THE JUNE-FLOWERING LEIOHYLLUM BUXIFOLIUM.

appear to be identical with ours. *D. Cneorum* major is even more sumptuous in all its parts and there is a pretty white form.

Very attractive against the thick-set, dull green foliage of *Leiohyllum buxifolium* (*Ledum Lyoni*) are the clusters of bright red buds which now appear on this little American shrub. This is a delightful plant for any cool soil, the said buds breaking into a multitude of tiny silvery-white blossoms. The pale lettuce-green of *Spiraea decumbens*, which blooms rather later, makes a pleasing contrast with the above and another good and somewhat similar species is *S. Hacquetii*.

Teucrium fruticosum (*latifolium*) must also be included here, though as a wall shrub it will often exceed the limitations of a dwarf. This is a fairly hardy plant and the large pale azure blossoms which appear among its silvery leaves towards the end of April in specimens not cut back, will be maintained in succession the season through. Of somewhat similar habit is the lovely *Veronica*

Hillebrania, whose semi-trailing branches are now terminating in those wonderful sprays of cool lavender.

Among the earlier *Cistuses*, *C. Gauntlettii* (almost a crimson) must be given high rank and the silvery-pink *C. creticus* is another lowly species of quality. *C. rosmarinifolius*, when it is not something else! is a choice little upright shrub, whose pure white flowers are afforded such an admirable background in the dark green, rosemary-like foliage, and both *Cistus* (*Heliathemum*) *formosus* and the variety *unicolor* are always among the first of the yellows.

With these latter opens the season of the Sun Roses of garden origin, whose hue range of colours, elegance and freedom of habit have won for them so much popularity. There is sufficient choice among these pretty things to satisfy the most exacting tastes, and there are one or two which I

should not like to be without. They are *H. Chamæcistus*, Miss Mould, *tomentosum*, *Fireball* and a very silver-leaved variety with larger flowers than any other (*i.e.*, nearly 2ins. in diameter) in a most delicate wild rose pink.

A rather remarkable little shrub among the Heaths at this season is *Bryanthus erectus*, said to be a blend of *Rhododhamnus* and *Kalmia*; but it has so much in common with *Bryanthus empetrifolius* that one cannot help thinking it is related. Seen growing side by side, *B. erectus* suggests an upright form of *B. empetrifolius* with foliage of a rather darker green and flowers of the same size and vivid rose colour, but differing in one notable particular, which is, that they open wide like those of an *Azalea*.

Rhododendron glaucum still holds its own among the inrush of Japanese and other kinds and it will have to be a shrub of parts that can rival this little Himalayan in shapeliness, slow growth, regular flowering and the cheerful apple-blossom

pink and white of its pendent clusters of wide-mouthed bells. Being an evergreen it is the more valuable in the rock garden than its contemporary, *R. (Azalea) Vaseyi*. The pinky white flowers of this latter are now very lovely in the shade of the woodland, where also flourish *AA. ledifolia alba* and *narcissifolia*, whose very double flowers are a delightful shade of lavender purple. And so one might go on to *AA. viscosa* and *nudiflora* and *Rhododendron punctatum*, a loose-habited, semi-trailing species, with neat little clusters of silvery pink blossoms, and many others.

A good word for the early and very fragrant *Lavandula dentata*, for *Calceolaria violacea*, just shaking out its dainty cowbells in violet and white and gold, and for *Thymus comosus* must complete a somewhat incomplete list. Of the last-mentioned I am not quite sure. It came here under that name, grows nearly a foot high, and throughout April and May its grey-green branches are a mass of comparatively large rosy lilac flowers. N. W.

THE TREE PÆONIES

UNTIL the introduction some few years ago of two shrubby species of Pæony from China, the only one grown in gardens in this country was the well known *P. Moutan*. The large handsome flowers of this plant in many beautiful forms both single and double, are familiar to most garden lovers, and as a decorative plant for sheltered situations it is unsurpassed for producing an effective display.

With the exception of certain favourable localities Tree Pæonies do not flower so freely as may be desired, and they frequently suffer from the effects of spring frosts on their tender shoots. A partially sheltered situation should be selected for these plants, either in a corner between walls or houses, or in a shrubby border not exposed to the east winds. After the plants have commenced growth in spring it is advisable to protect the young

bare for two-thirds of the actual height, and crowned by a mass of finely cut, light green leaves, very graceful in appearance, with the flowers often at, or near the base of the foliage. The flowers range in size from 2½ ins. to 4 ins. in diameter and are semi-pendulous; the petals being very fleshy, shining, of a deep, almost blood crimson, with golden or greenish yellow anthers. *P. Delavayi* has been established in many places in this country and has proved easy to cultivate and is fairly free-flowering.

P. LUTEA.—This species was also found by the Abbé Delavay in 1883 on the limestone mountains east of the great Tali Lake. It grows to a height of 3 ft. to 4 ft. and is found in similar situations to *P. Delavayi*. It flowered for the first time in the Jardin des Plantes at Paris in 1887, having been raised from seed sent home by the Abbé Delavay. Seeds were also sent home by Wilson and Forrest,

It has branching stems and deeply cut leaves. The flowers are very large, variable in colour, and there are both single and double forms, blooming out of doors during the month of May. The best plants I have seen were grown in the sheltered angle of a high wall at the end of a greenhouse, with a south-western exposure. Here it used to flower freely, producing its huge double flowers in abundance. A few of the many beautiful varieties in cultivation are: *Athlete*, rose; *atro-sanguinea*, deep blood red; *Comata*, white; *Dr. Bowring*, rose pink; *Emperor Alexander*, rose tinged with lilac; *Flora*, pure white; *fragrans maxima plena*, salmon red; *Leopoldi*, carnine; *Madame Stuart Low*, salmon red; *Reine Elizabeth*, rose pink; and *Zenobia*, dark maroon.

PP. Delavayi and *lutea* are readily raised from seed and soon make good flowering plants. They are also propagated by grafting on the usual stocks used for the purpose in the case of the finer double forms of the Tree Pæony, *P. Moutan*.

W. L.

A TYPICAL BLOSSOM OF A SINGLE VARIETY OF PÆONIA MOUTAN.

shoots with a covering of some sort while there is danger of frost. For Pæonies to flower at all freely the wood must be thoroughly ripened after growth, so that a sunny place is essential. They prefer a rich, deep loam, which should be well trenched before planting, while plenty of manure should also be added. Tree Pæonies may also be grown in pots for flowering under glass, and may be had in flower early in March, but they require a very rich soil.

P. DELAVAYI.—This species was discovered by the Abbé Delavay, after whom it is named, in the year 1884, on the Lichiang Mountains of Western China. It was growing on the limestone at an elevation of from 10,000 ft. to 12,000 ft. It is not, however, confined to this range of mountains, as, during recent explorations, it has been found fairly abundantly in most alpine regions of Western China and Tibet. Forrest says that these Pæonies are plants of the open Alps, but are at their best where a certain amount of shelter from wind is afforded by scattered scrub and bracken. Generally they are found on a southern or eastern exposure, in light, rubbly, well drained loam. There they often reach a height of fully 6 ft. The stems are generally

who met with it in their travels in the Yunnan region. It has proved quite hardy, and although the stems sometimes get cut down to the ground in winter, fresh shoots are sent up in spring. The leaves are large and glaucous and divided into a large number of segments. The flowers in the type are a clear, deep yellow, 4 ins. across, semi-double and of good substance. Their chief fault is that they are pendulous and often hidden beneath the foliage. Good forms of this plant have been selected and sent out under the names of *grandiflora* and *L'Esperance*, both with larger and more erect flowers. In his journey Forrest met with many colour variations, from sulphur to a deep canary yellow, while others were blotched with deep crimson at the base, or flushed with dull brownish orange. *P. lutea* flowers in June, two or three weeks later than *P. Delavayi*, and while in the latter the new growth comes up close to the old stems, in *P. lutea* shoots come up often 18 ins. or more away from the main plant.

P. MOUTAN.—This species is widely cultivated in China and Japan and was introduced into this country as long ago as 1789. Of shrubby habit, it grows up to 5 ft. or more in favourable situations.

GREENHOUSE ACACIAS

THE genus *Acacia* comprises 420 species at a moderate estimate, but others have been discovered since this estimate was made. They are spread over the warmer regions of the Old and New Worlds, but occur most abundantly in South Africa and Australia. All the best greenhouse species come from some part of Australia or the neighbouring island, Tasmania. Strange to say, not a single species is native to New Zealand, though *AA. decurrens* and *dealbata* have become naturalised in some places, as a result of planting them for tanning purposes. The allied *Albizia lophantha* has also got naturalised in a similar way.

The Acacias are members of the Pea family, though they have small, regular flowers crowded into dense globose heads or spikes, totally unlike the flowers of a Pea, and not to be confused with *Robinia*, often called *Acacia* or *False Acacia*. They are sometimes named *Mimosas*, especially those that are brought from the South of Europe, where they bloom in the open, for sale in the London markets during winter. Except along the southern and western seaboard of Britain they must be regarded as greenhouse plants in this country. They do not require much heat, however, so long as frost is excluded, and will be happy at anything between 40° and 50°. They are just the shrubby plants for the heated greenhouse of the amateur, while at the same time they are fitting plants for the greenhouses of a king.

They are of the easiest cultivation at all times of the year, and make their best growth, plump up their flower-buds and flower most profusely when stood on a bed of ashes in the open air from May or the beginning of June to the beginning of October, when they should be taken indoors again. They may be grown in pots or tubs, according to size, but do not require a great deal of root room. Their flowering period, under the above conditions of temperature, ranges from February till June, though most of them bloom between March and May. Their flowering may be hastened by keeping the temperature a little higher than it need be. A few plants may be put into heat at a time to secure a succession, but it is well not to allow the temperature to rise above 55° with sun-heat, giving air at the same time to make the flowers more durable. These plants should be put in a cool conservatory as soon as they are fairly in bloom.

The bushes or trees may be pruned into shape as soon as they have done flowering, and repotting may be done then if a larger pot is required. The best compost consists of loam and peat in equal proportions, with a good sprinkling of silver sand; but leaf-mould may be used instead of peat if more convenient. The new soil should be rammed in fairly firmly with the potting stick to make it bind with the old material. Being evergreen, these plants should not be hard pruned, and will flower all the better if only trimmed into shape. Some of the smaller ones, like *AA. Drummondii* and *pulchella*, will stand more pruning than the taller ones, especially if they are kept in the greenhouse to start them freely into growth before being put outside.

All of them may be increased by means of seeds when obtainable. *A. dealbata* and *Albizzia lophantha* (usually named *Acacia*) are more often raised from seeds than any others, and seeds are readily obtainable. The others may be increased in summer by means of cuttings of half-ripened wood, removed with a heel and inserted in pots in equal parts of peat and sand. Press the compost firmly into well drained pots, cover it with silver sand, insert the cuttings firmly, and water them well through a fine rose to settle the soil. After the cuttings have dried they may be placed under bell-glasses or hand-lights and shaded from bright sunshine till rooted. Never allow them to get dry. As soon as the cuttings are rooted they should be potted off singly. The after-culture consists in stopping the bushy types occasionally to get branching bushes for small pots. Tall-growing species like *AA. dealbata* and *longifolia* should be allowed to run up like little trees without stopping. Being evergreen, none of them should be allowed to get dry at the root, even in winter; but during warm and dry weather in summer they should be given an abundance of water to favour a liberal growth of young wood, for upon this depends a profusion of flowers.

ACACIAS WITH LEAVES.—Most, if not all, *Acacias* produce true leaves in the seedling stage, but lose them in a great many cases after they have made a little growth, the functions of leaves

being afterwards performed by the leaf stalks, which are flattened on both sides, more or less widened and named phyllodia. True leaves are mostly twice divided and the leaflets very small. The best known of this group is *A. dealbata*, often grown as a climber in conservatories, but brought to this country from the South of Europe in great abundance during the winter in the cut state. It is the Silver Wattle of the settlers in Australia, so named from the grey undersurfaces of the leaves. The large panicles of bright yellow flowers are very handsome and last long in the dried state. A more recent introduction is *A. Baileyana*, of more slender growth, with smaller leaves. When first introduced it was considered a finer thing and likely to supersede *A. dealbata*, but so far this has not been confirmed. There is room for both. The tall-growing *Albizzia* (*Acacia*) *lophantha* is greener in foliage and generally grown in the flower garden during summer. The beautiful

Acacia Drummondii with its long, cylindrical spikes of flowers is a most useful plant in the greenhouse, because it can be flowered at any height, from 1ft. to 10ft. *A. pulchella* varies from 2ft. to 3ft. in height, and has two taller-growing varieties usually regarded as distinct species in gardens.

ACACIA LEPROSA, A TYPICAL SPECIES WITH PHYLLODIA.

One of these is *A. grandis* with longer pinnae and one or two heads in the axils of the leaves. The other is *A. hispidissima* with white, globular heads, a very unusual colour among *Acacias*. Small plants of all three can always be had by rooting cuttings occasionally.

ACACIAS WITH PHYLLODIA.—This form looks as leafy as the other type, and the phyllodia are regarded simply as leaves by most gardeners. The peculiar structure of the leaf-stalk is a natural device to counteract the heat and drought of a dry climate. The leaf-stalk is flattened vertically so that the sun strikes it on the edge chiefly. Both surfaces are of identical structure and colour, as in an adult *Eucalyptus*.

A. leprosa, though introduced in 1817, never became widely disseminated in private gardens while *Acacias* were popular, so far as my observations went, but it is one of the most handsome, with its broad leaves and long branches laden with large bright yellow heads. One could wish it were more common now. A narrow-leaved variety, *A. l. tenuifolia*, was introduced in 1883. The pale yellow *A. Rieana*, on the contrary, used to be in almost every greenhouse. Its long, twiggly branches and small leaves resembled cataraacts of drooping spray when in bloom, and the plant has been compared to a Weeping Willow. No *Acacia*, perhaps, was more widely circulated forty years ago than *A. armata*, with its upright habit, densely leaty twigs and single heads of bloom, thickly produced all over the branches. Pot plants for the conservatory were indispensable. It was often raised from seeds, and the varieties *A. a. angustifolia*, *A. a. microphylla* and the weeping *A. a. pendula* are still in cultivation.

Not many years ago the graceful, twiggy and upright shoots of *A. haetulata*, laden with small pale yellow heads along the greater part of their length, might frequently have been seen at the

ACACIA BAILEYANA, WITH TRUE LEAVES.

meeting of the Royal Horticultural Society. The species rejoined in a number of other names, including *A. cordata*, *A. cordifolia* and, perhaps, *A. ovata*. Another handsome and beautiful species is *A. linearis* with branching spikes of flowers and long, narrow leaves clothing the twiggy branches. Smaller in every way is *A. diffusa*, seldom exceeding a height of 2 ft. If contrast is wanted in the form of these flattened leaf-stalks, it can be found in *A. cultorumis* with its curved and hooked organs, resembling a sort of knife though scarcely run in length. Those of *A. glaucescens* are sickle-shaped.

As far as I have seen, *A. platyptera* is unique, inasmuch as the broad leaf-stalks run down the

twigs in the form of broad green wings, totally unlike any other. It flowers freely and recalls *Genista sagittalis*, but grows 2 ft. to 3 ft. high and stands perfectly upright. It is a great curiosity, besides being ornamental. *AV. verticillata* and *juniperina*, on the other hand, resemble long-leaved Junipers, with their narrow, sharply pointed leaves arranged somewhat in whorls round the twigs. They may be grown in pots, but make handsome bushes planted out in the cool conservatory and allowed to grow into pyramids 6 ft. to 10 ft. high. At one time *A. longifolia* was very popular on account of its bold habit, long leaves and profusion of flowers. Four varieties were named floribunda, magnifica,

micronata and *Soploren*, and testify to the esteem in which it was held. *A. melanoxylon* is similar in habit, but sometimes bears true leaves at the ends of the branches.

Fortunately, all of the above are still in cultivation or were so until quite recently, and green-houses and cool conservatories would be greatly enriched by their more extensive cultivation and dissemination in private gardens. Few of the stove species are now grown and, perhaps, none of them get outside botanic gardens. The Bull's Horn *Acacia* (*A. spherocephala*) is the most interesting, because the old and broken spines get inhabited by ants in its native country protecting it against leaf-eating insects. J. F.

TULIPS AT VINCENT SQUARE

THE height of the May-flowering Tulip season generally coincides with the Great Spring Show at Chelsea, but with a rather later date for the Show than usual and an early season it is more than probable that the fortnightly meeting of May 8 and 9 at Vincent Square provided the Tulip feast of the year. It was also the occasion of the annual Show of the National Tulip Society, but as that body has resolutely set its face against the Tulip as a garden flower, it gains no glory from the wonderfully gorgeous displays of Darwin, Cottage and Parrot Tulips that were arranged around the hall. The exhibits of the special society were set out in the annexe, and could

comfortably have been displayed on a fair-sized dining-table. Although the enthusiasts show their fancy flowers—the flaked and the feathered blooms of the hyblomems, the bizarres and the roses—cut short in the stems and on exhibition boards, yet these “refined” blooms have a certain and distinct value in the garden, and when shewn would fascinate many visitors if only the blooms were set up in a natural manner.

To those, whom one may call the non-florists, who know nothing of the “points” of the fanciers’ flowers, it would be the class for Breeder Tulips that would attract most attention. The four exhibits of six blooms of this type were all especially good, and the flower of *Gleam*, which was the

premier Breeder in the Show, in Mr. C. W. Needham’s first prize exhibit would, for its beautiful rose colouring and perfect shape, delight anyone. One could not help longing, however, to have seen it in a vase and on a stalk of nature’s length. *Alcestris* was another beautiful bloom in this class. Mr. Needham also had the best three Breeders, and here a bloom of *Goldfinger*, somewhat like *Gleam* in colouring, was superb. Mr. J. W. Bentley was second in the six class and Mr. C. J. Fox won the other second prize.

The best twelve rectified blooms were shewn by Sir D. Hall, whose collection included *Attraction*, the premier bizarre bloom, *Athos* and *Garibaldi*, feathered bizarre, and *Elvira*, flamed

THE LILAC AND PURPLE IRIS DOUGLASIANA MERTON

RICH ROSY PURPLE, IRIS TENAX PURPUREA

rose, were also nearly perfect. Mr. J. W. Bentley was second, and his board contained, in a lovely bloom of Sam Barlow, the premier byblömen. The best six were set up by Mr. Bentley, and the flamed bizarre Stockport was his very best. Sir D. Hall was second, and he included a good example of Sam Barlow. In the class for three feathered blooms, and in that for three flamed as well as for one bloom of each, Mr. Bentley won the first prizes.

Although one could find a certain amount of interest in the formality of these florists' Tulips, the big groups of long-stemmed Darwins and others in the hall certainly gave much more satisfaction, and these were so good that two gold medals were awarded. Messrs. Dobbie and Co. and Messrs. Barr and Sons were the honoured exhibitors. Their collections were quite distinct in character. The former was a most glorious display of magnificent Tulips arranged boldly and to great effect. Messrs. Barr staged a surprising variety, and seemed to aim at making a collection rather than at illustrating the decorative effect of massed blooms, yet when the blooms opened the general effect was decidedly good.

In Messrs. Dobbie's group one felt compelled first to admire the gorgeously coloured Parrot Tulips, which were shewn more largely than is usual. The chief varieties were Chamoise Brilliant, Perfecta, Fantasy, Mark Graal and Sensation. There were also many Darwins and a large vase of golden blooms of Walter T. Ware. Of Messrs. Barr's almost innumerable varieties those of mauve shades seemed to predominate, and they ranged from the very pale Suzon through Rev. H. Ewbank and The Bishop to the darker Hippolyte and The Giant. Along the front there were a number of vases of particularly good Florists' (or Old English as they are often termed) Tulips, but they did not have the colour value of many of the pink and rose pink Darwins.

The "Black Tulip" always fascinates visitors, and good examples were to be seen in many collections. La Tulipe Noire is still the darkest of these dark-hued Tulips. Negro and Zulu in Barr's group, The Sultan and Le Nigre as shewn by Messrs. R. H. Bath, Limited, were only a shade lighter. Artemis, the lily-shaped Tulip of rich carmine colouring, and the green-flowered blooms of viridiflora attracted considerable attention.

Those who love colour schemes in flowers had a splendid opportunity among these gorgeous Tulips, for nearly every possible shade of colour was represented. Messrs. J. R. Pearson, Limited, shewed how well several of the yellow and orange shades will go with pink, and their association of the mauve-coloured Erguste with the shining bronze Domi Pedro was very delightful. In Andromarque they shewed one of the richest-coloured Tulips in the Show, but its vivid deep rose cerise is a difficult tone.

The graceful shape of Tulip Gesneriana and its varieties was to be seen in most collections. Messrs. G. Bunyard and Co. had a large stand of the variety spatulata, which was greatly admired and was in harmony with the lilac shades of Melicette. The purple and golden Turenne was represented by many quite gigantic blooms. In the annexe Mr. B. Pinney, who during the earlier spring has shewn excellent Violets, had a pleasantly arranged collection of Darwin Tulips with Aquilegias and a large bunch of very fragrant Lily of the Valley undoubtedly gathered in the open. The Welsh Bulb Fields, too, had a goodly group of fine blooms in such sorts as Moralis, Marcella, Orange King and Loveliness. Some good judges thought it worthy of a gold medal. The very late-flowering Narcissus Idris was well shewn here.

Among the other flowers Rhododendrons, Roses and Carnations were very prominent. The outstanding Rhododendrons were the seedlings shewn by Mr. J. H. Lowinsky, and these illustrated really great improvements in compactness of truss and colouring. Needless to say, they received a deal of attention from all lovers of trees and

The fruits were both on the plants and as dishes of gathered fruits, and mostly of The Duke, which is strongly recommended for all purposes. The varieties Lord Beatty and Sir Douglas Haig were also there and are very desirable Strawberries.

Messrs. Sutton and Sons had one of their collections of high-class vegetables, which included

ALMOST PLATTER-SHAPED BLOSSOMS OF RHODODENDRON DECORUM MRS. MESSEL.

shrubs as well as the special Rhododendron people.

In his group of Roses Mr. Elisha J. Hicks gave the central position to a large quantity of his new variety David Lloyd George, and it was wonderfully effective. Among the greenhouse plants the profusely flowered specimens of Acacia pulchella and Erica Cavendishiana shewn by Messrs. Stuart Low and Co., the giant Streptocarpus by Messrs. J. Peed and Son and the Zonal Geraniums (Pelargoniums) by Messrs. Jarman and Co. were very good indeed. Mr. Philip Ladds staged two bedding "Geraniums." Gloriation, a single-flowered scarlet with large trusses, should be very useful.

Pansies and Violas were set out in fair quantity, and the strain of giant Pansies displayed by the Chalk Hill Nursery Company was fine in form, colouring, size and freedom. Their Cheiranthus hybrids of C. Allionii type contained many desirable shades of colour.

There were many alpine exhibits, and among them we noted the double-flowered Welsh Poppy near the blue Himalayan (Meconopsis Pratii). The orange-coloured Geum Borisii in Mr. Amos Perry's group was very showy.

Irises, chiefly seedlings of the Bearded types, were staged in goodly quantities by the Orpington Nurseries Company, and some excellent new seedlings were on view. The clear primrose-coloured Yellowhammer was particularly attractive. Their seedlings of Regelia-cyclus Irises were beautifully marked, while crosses between Bearded Irises and other sections were interesting and some of them beautiful.

Messrs. Wallace and Co. had some specially well flowered bushes of Rhododendron Pink Pearl, Mrs. C. C. Sterling and Hugo de Vries with their Tulips and other flowers.

Laxtons of Bedford brought some forced Strawberries of most delicious appearance and aroma,

almost all possible sorts. There were early Carrots, Lettuces, Mushrooms, Broccoli, Cabbage Sutton's Harbinger (which had the appearance of melting tenderness) and Vegetable Marrow Pen-y-byd, so round that at a little distance they might have been taken for Melons.

NEW AND RARE PLANTS.

Cytisus Cornish Cream.—An erect-habited, free-flowering Broom of, apparently, moderate size. The creamy white flowers have, when at their best, a deep orange throat. This very beautiful variety was raised by Mr. P. D. Williams of St. Keverne. Award of merit to Mr. R. C. Notcutt.

C. Donard Seedling.—A sturdy, erect-branched, free-flowering Broom bearing flowers suggestive of those of C. Dallimorei, but of more rosy colour and without the yellow. The standard petals are paler inside, and this gives a pleasing soft pinkish effect. Shewn by the Donard Nursery Company.

C. Dorothy Walpole.—The richest and deepest coloured of its class, and the little group of plants shewn with the general exhibits were exceedingly effective. The stems have a graceful disposition. The keels of the flowers are a rich velvety crimson and the standards are coloured dull cardinal on the outsides, which shews as pale rose colour on the interiors. Award of merit to Messrs. W. Watson and Sons.

Hydrangea Marechal Foch.—A very uncommon and distinct variety of Hydrangea hortensis. It is of good habit, and the compact heads are made up of deep red flowers which often have blue centres. Award of merit to Mr. H. J. Jones.

Iris Douglasiana Merton.—Said to be a Californian Iris, this is a pretty little plant about

a foot high. The pale lilac flowers have rich purple markings and white rays. Award of merit to the raiser, Mr. W. R. Dykes.

I. tenax purpurea.—Of similar size and type to the foregoing, but of rich rosy purple colouring with golden rays. A very graceful species. Award of merit to Mr. W. R. Dykes.

Polemonium carneum.—This is an uncommon "Greek Valerian" apparently of dwarf and compact habit, though no information concerning it was available. The flowers are unusually large and of a pale mauve shade of colour. Shown by Mr. A. C. Bartholomew.

R. Sargentianum.—One of the dwarf little evergreen Rhododendrons which are of value for planting in the rock garden and as edgings or borderings to collections. The small trusses are creamy white in colour and the tiny ovate leaves are deep green. The flowers are scented, but we should not call them fragrant! Award of merit to Lady Aberconway.

Rhododendron decorum Mrs. Messel. A most delightful pure white variety which possesses the delicate fragrance of the type. The large trusses are made up of good-sized blooms which are curiously flattened, giving it a quite distinctive appearance. The flower-stems are covered with delicate pale buff hairs. We imagine that, like the type, this variety will thrive best if grown where it receives plenty of light but is shaded from the direct rays of the sun. Award of merit to Lieutenant-Colonel Messel.

Rose David Lloyd George.—This well formed Hybrid Tea variety should have a great future as

an all-purposes Rose, and the only additional attraction one could wish would be more of that precious gift of fragrance, though the faint perfume may probably be more pronounced in blooms grown out of doors. The flowers are good in all stages of development, they have long stout stems and are of a deep satiny pink colour. Award of merit to Mr. Elsha J. Hicks.

Rose Muriel Wilson.

This is also a first-rate Rose. It is a creamy white Tea variety of large size, excellent shape and pleasantly fragrant. The flowers have splendid stems and will be valued by exhibitors.

Tulip Alcamene. A magnificent Darwin Tulip of moderately good form and gorgeous, deep rosy cerise colour. Award of merit to Messrs. R. H. Bath, Limited.

NEW HYBRID TEA ROSE, DAVID LLOYD GEORGE.

Viola hybrida Haselmere.—A very pretty, free-flowering Viola of compact tufted habit and bearing plenty of medium-sized, golden-edged lilac flowers. It is of quite uncommon type, and should be in great demand for spring bedding purposes. Award of merit to Messrs. Thompson and Morgan.

Odontioda Naomi.

A magnificent spike bearing fourteen roundish flowers was shown. The colour is a rich glowing deep orange shaded with mauve. The flowers are lightly edged with white and have a golden crest. First-class certificate to Mr. R. Gerrish.

Odontoglossum Gorizia Imperial Purple.—A study compact spike of large roundish flowers of blue colour lightly spotted and edged with the palest blush. Award of merit to Mr. J. J. Bolton.

O. Tagus. Gerrish's Variety.—An Orchid of uncommon but by no means pretty colouring.

The general effect is blue-purple. The very large star-shaped flowers are of dusky maroon colouring broadly tipped with pale purple. The lip has a distinct white band and there are golden lines at the crest. Award of merit to Mr. R. Gerrish.

VIOLET CRESS

Though not at all well known, *Ionopsidium acaule* is a rock plant of distinctive character and considerable merit. It is a diminutive plant not exceeding a height of 2 ins. to 3 ins. The tiny, prettily shaped leaves and flowers are borne singly on slender stems radiating from a central crown. Thus they form little cone-shaped plants like small rosettes. The foliage is light green in colour and consists of small, lobe-shaped leaves on stems about an inch in length. The flowers are of a soft lavender shade. In shape they clearly denote that the *Ionopsidium* is a member of the natural order Cruciferae, being typically characteristic of this family. Fortunately this little plant has an unusually long flowering season. It may be seen in blossom in the open from April till October, and if young plants are put into pots (or preferably shallow pans) in autumn and given the protection of a cold greenhouse, they will continue to flower well into the winter months. Thus it is much appreciated in the alpine house at a season when other blossoms are scarce. *I. acaule*, commonly called Violet Cress, is a native of Portugal. Though an annual, it will, when once established, continue to reappear from self-sown seedlings. These set themselves in crevices, etc., giving a pretty and natural effect. Other plants with this characteristic one usually hesitates to introduce into a rock garden, lest their newly produced seedlings eventually become weeds, which will prove detrimental in overgrowing rarer favourites. This little plant, however, is so miniature and slender that this danger need in no way be feared.

A SPLENDID LATE-FLOWERING GOLD-CUPPED NARCISSUS, N. IDRIS.

FRAGRANT FOLIAGE—I

SOME little time ago occasional notes appeared in *THE GARDEN* on the subject of hardy plants with fragrant foliage, notes all too short as it seemed to me, who have a special affection for these sweet-smelling things. A full list of hardy and easily procurable plants with fragrant foliage must be useful, one would think, to all who are concerned for the sweetness of their gardens. Not that fragrant leaves can take the place of fragrant blossoms. We all agree with Bacon that "the breath of flowers is far sweeter in the air (where it comes and goes like the warbling of music) than in the hand." Of course it is; but, for myself, I confess to a scarcely less warm regard for those unobtrusive things that part with their perfume only when they are "trodden upon and crushed"—the Balms, Mints, Marjorams, Thymes and other plants which do not thrust their fragrance on the passer-by, but nevertheless are ready with it when he happens to want it. I hope I may, without seeming to boast, claim to possess a catholic sense of smell, which can tolerate, if not enjoy, scents regarded by the organs of my more fastidious neighbours as too obvious and rank. They cannot abide, for instance, the Crown Imperial, because, they say, it smells like a fox. I do not myself know how a fox smells; but if Crown Imperials smell so, there is a spot in my garden that smells at this moment strongly of foxes, these Fritillaries being now in supremely fine feather; though it is the root rather than the flower that emits the characteristic odour. I would not venture to maintain that the Crown Imperial odour is exactly pleasant—it certainly suggests the animal rather than the vegetable—but, coming as it does from such a quarter, I find it easily possible to tolerate this scent, if not to welcome it. It has at least none of that fetid quality which we associate with some of the Arums and Stapelias.

No doubt various philosophers have, at one time or another, dealt with the psychology of smell, as with that of the other sensations; but I have forgotten, if I ever knew, what they say on the subject. No other of the five senses (of my own five, at least) is more subtle in its suggestions than the sense of smell, or more unmistakably reminiscent of a time and state in which one was something else, and possibly something better. "Shades of the prison-house begin to close about the growing boy." So they do; but one would fain believe that they never close so completely round boy or man as to prevent his having, now and then, some hint of the light, or melody, or perfume that never was on land or sea. Now and then—all too rarely, perhaps, but yet occasionally—a breath of Eden (not necessarily from any flower garden, but from any chance quarter, a hayfield as likely as not, or a bean-field, or a wayside Briar bush) touches the olfactory of the worldling and he says to himself, "The poet was right after all. Our birth is a sleep and a forgetting, for that was sure a trail of the incense I used to smell in heaven." Crusted as I am myself with time and the world, I sometimes have my "intimations"—not so often as I could wish, but sometimes. There, for instance, is the perfume of Box on a summer morning. Curiously enough, no one seems to understand me when I speak of that subtle fragrance which is the floating spirit of the Box tree. Bacon's "dying Strawberry," I regret to say, leaves my sensories untouched, possibly because I have never chanced on Strawberry leaves at precisely the right stage of their mortality. Nor is the Box, any more than the Strawberry leaf, too lavish of its scent. It

does not make itself cheap. You may pass a Box hedge 360 days of the 365 and smell nothing; but, given a certain blandness in the air, with the proper amount of hot sunshine, and there is an unmistakable something, not perfume exactly, as we understand the word when we speak of the perfume of the Rose or the Sweet Briar, but an incense rather, qualified perhaps with a hint of acidity, such an aroma as Pan might have sniffed with relish, if that deity had a mucous membrane to his nostrils.

Fragrant foliage is found, I think, mostly in plants of low herbaceous growth, less frequently in shrubs, and least frequently in trees. Besides conifers, so many of which diffuse a pleasant and wholesome resinous smell, I can remember no trees of common occurrence that have foliage of a pronounced fragrance, except the Walnut tree and the Balsam Poplar. The leaf of the Walnut, which in its earlier and more tender stage has a fruity fragrance suggestive of ripe Pippins, is what Bacon terms "fast of its smell"; that is, it does not give off its perfume except under pressure; whereas the Balsam Poplar saturates

the air with fragrance, this proceeding, I suppose, from the gum which is secreted so plentifully when the leaf-buds are bursting. Shrubs of the Escallonia family, in the early stages of growth, have also a viscous and more or less fragrant foliage, *E. macrantha* in particular emitting a fragrance similar to that of the Balsam Poplar and almost as powerful. The Birch also is slightly gummy and aromatic when it first bursts into leaf. The Sweet Briar, on the other hand, the fragrant shrub by pre-eminence, owes its perfume to the numerous scent-glands with which its leaves are provided. The Myrtle family contains a considerable number of shrubs and trees with foliage more or less aromatic. Besides the Myrtles proper (*Myrtus*) their Australasian congeners, the *Leptospermums* and the *Eucalypti*, emit a strong perfume, which, however, in the Gums at least, is not always pleasant. There is also a New Zealand *Olearia*, the specific name of which I have forgotten (*moschata* probably) which smells more strongly of musk than the Musk plant itself, and in consequence is called by Dominionists "the Musk tree." SOMERS.

THE PASQUE FLOWER

An Account of it as a Native Plant.

I PRESUME nearly every gardener or garden-lover is acquainted with the Pasque Flower, but I cannot help wondering how many know this plant as a British wildling, studding in untold thousands a chalky hilltop trampled into regular foot-high terraces by generations of sheep which have reduced the grassy sward to lawn-like shortness.

I have known the Pasque Flower since my earliest childhood, and vividly remember first seeing it on an elevated ridge of heather-clad moorland. The rapture with which I gathered a few of the rich purple silky and golden tasselled flowers! The pride with which I took them to my dear mother, who told me the name of my find! and made an annual pilgrimage for the

next few years each March or April whenever I could coax leave from my teachers for the time needed for this long botanical ramble. Since those days I have met the Pasque Flower in many lands and have cultivated it in its various forms (and its near relations also) and am thrilled anew by it each season when the first flower-buds emerge from the finely slit, silky, silvery grey covering that protects them from the sudden changes of our early spring months.

The plant grows stalwart under cultivation, and forms huge clumps carrying sheaves of enlarged flowers, and the leaves almost keep time with the developing blossoms, while in the wild state the flowers are produced mostly singly on inch-high stems looking bravely up to the sky and

THE PASQUE FLOWER, ANEMONE PULSATILLA.

expanding their petals and baring their golden hearts to every passing glint of hftful sunshine from March onward.

The localities for this plant in England are few and far between and, I believe, chalky pastures in every case, as often as not in the vicinity of Roman earthworks, which no doubt accounts for the widely spread belief that this plant was introduced by the Romans. A keen botanist friend assures me, however, the plant is truly native and, judging by its almost circum-polar distribution in one form or the other, I believe him to be right.

I know of three such localities, but the richest is undoubtedly the one I visited recently with my son, and our only regret is that the camera was left behind which might have provided us with a permanent record of the wonderful sight. A little while ago a friend and I had enjoyed the privilege of a visit to the famous gardens of Miss Willmott at Warley Place, Essex. The myriads of *Crocus vernus* in the parkland were out, an unforgettable sight, pictures of which appear annually in the horticultural Press; just such another sight in deep Tyrian purple was provided for us on the rounded dome of chalk above the old earthworks of the past invaders. It had meant a long cycle ride for us with a sky threatening rain, and our way was uphill and laborious, but the scenery was grand in its early spring greens; we had glimpses of the sun and the nightingales cheered us on our way from every roadside copse. The day was young and our time our own, so we "took it easy," and were amply rewarded for our labours when we had reached some five hundred feet elevation and turning round a pine wood corner saw the range of rounded chalk hills.

Then the question arose, which of these headlands is the Pulsatilla Hill? We had been well informed that only one of these hills was the home of our plant, and on a previous visit had sadly missed the spot and had searched the hills on the opposite side of the road in vain. However, this time luck is with us, and presently, having separated, I hear my son's shout, and hurrying towards him, breasting the steep slope, I find him gazing with awe and wonder at the unbelievable glory spread out around us for many acres. Millions of deep Tyrian purple cups, each with its golden central boss turned up to the sky, where the sun has now appeared, and the fast-travelling cloud-shadows passing over them dulled the colouring temporarily. There and then I realised why the country folks in certain parts of the Continent and again in North America call this plant "Crocus." The short stem, the almost absent foliage, the upstanding cups of intense colour, must recall to the lay mind the *Crocus*, a resemblance not noticeable in the laxer, more nodding forms of richer formations abroad and the altogether more lush habit of these plants under cultivation.

A keen search for colour variations proving fruitless, we rest ourselves among the flowers and note that they share the sod with *Cnicus acanthis* (the stemless Plume Thistle), *Bee Orchis* (*Habenaria conopsea*), *Thyme*, small *Hieracium*s and the whole gamut common to our chalk downs. We wonder how soon the sheep will be brought here and whether the plants will have time to ripen and distribute their feathered seeds before the sheep eat them. I fear it must be rare that seeds are distributed freely, or surely the surrounding hills, which appear equally suitable, would be as freely covered as this one. Careful search, however, reveals only one solitary outlier on a precisely similar knoll, and securing about a dozen roots for our garden of association we remount our cycles and with the gradient in our favour begin our long homeward journey well satisfied with our day's outing. WALTER E. TH. INGWERSEN.

CORRESPONDENCE

GLADIOLI: NOTES AND NOTIONS.

I AM inclined to agree with the Editor that the *primulinus* hybrids will prove to be harder than the Colvillei section. Although I have had bulbs in the ground undisturbed for two winters, there has not been a real testing winter to enable one to form a decided opinion on this point. Yet, even if the parent bulbs died, I think it would be found that some of the spawn would start growing in the spring. With the Colvillei section experience shows it is safer to lift the bulbs and replant in the autumn, otherwise it left in the ground they start into growth too soon, and should heavy frost occur many of the bulbs will succumb. I have *primulinus* hybrids which have been in the ground during the past two winters and another lot which were not lifted last autumn; all are growing, but the growth is not so far advanced as on those lifted and replanted last month.—G. C.

FROST IN SOUTH DEVON.

ON my return to South Devon after a fortnight's absence I was astonished to notice the damage done by frost in my garden. The winter here has been exceptionally mild, and, in consequence, everything was unusually forward. When I left home *Rhododendrons* *Augustinii*, *rubiginosum* and *yunnanense* were in full bloom. On my return I find all the blooms quite spoilt, and also many on my plant of *R. campylocarpum* and the

and I fancy the damage was done on that date and the 23rd. *Meliosma cuneifolia* also suffered badly.—H. G. HAWKER.

KALE AND "CLUB."

THE Editor's footnote to "Claremont's" query, page 229, issue May 5, is very near the mark. Undoubtedly the cabbage-gall weevil does a lot of harm to plants of the Brassica tribe, and the result of its ravages is often mistaken for true "club." But Kale is subject to "clubbing" more in some soils than in others. Real "club" generally begins while the plants are in their seed or nursery quarters. I have seen very bad cases where seedlings have been raised in the same quarters year after year—a wrong thing to do. I have experienced "clubbing" in all kinds of winter greens and effected a cure. In my case the greens had to be grown on the same quarter each year—about one acre—and this course had been taken for about seventy years. My first experience with the garden in question was disappointing, as the summer was abnormally hot and the plants suffered terribly. The following spring we applied 2 pecks of lime and 1 peck of agricultural salt per square rod when digging and manuring the ground. Result: much less "club." After the second year's application scarcely any "club," and none after the third. Through the gardening Press I made this known, and have had much evidence since, both locally and from widely

different parts of the country, that the treatment had proved satisfactory. I do not know whether it would answer in the case of the gall weevil referred to by the Editor.—GEORGE GARNER.

FASCIATION.

I NOTICE in the issue of THE GARDEN for May 5 an illustration of a fasciated *Empress* Daffodil. I found one this year of the variety *Victoria* with three flowers on one stalk which is so uncommon that I photographed it and enclose a copy. The photograph is taken with the aid of a mirror to shew front and back of the specimen. I also found a double in the same variety. The Daffodils here have given a remarkably fine show, and this, following a cold wet summer, rather upsets one's theories about the thorough ripening of the bulbs; last season's fine show being attributed to

A FASCIATED VICTORIA DAFFODIL—FRONT AND SIDE VIEWS.

new growth on *R. Mrs. Butler*. All my *Primula pulverulenta* are spoilt, but *PP. japonica* and *helodoxa* are uninjured. *Gunneras* and *Osmundas* are also badly touched by the frost. I should be interested to hear of other people's experiences in Devonshire. We had a sharp white frost at Haslemere, where I was stopping, on April 22,

the effects of the drought of 1921.—H. C. WOOD, *Lingfield, Surrey*.

WINTER GARDENS.

"WHY do people so seldom indulge in a winter garden?" Mr. Thackeray Turner asked this question in a recent issue of THE GARDEN

(page 99), and when one comes to think of it it is certainly remarkable how seldom one has seen a garden devoted exclusively to the flowers of winter and earliest spring. There are many gardens in which the rock garden that one finds, though convenient for cultural purposes, looks quite inappropriate to its surroundings, but where the enclosed winter garden that one does not find would look perfectly in keeping. I feel sure that if more gardeners had seen winter gardens as delightful as Mr. Thackeray Turner's, there would be more attempts to follow his example; I once saw the carpet of *Iris reticulata* and *Crocuses* that he refers to and often think of its rare beauty as a garden picture when I hear people talk about making "a blaze of colour all the year round." Is not that one answer to Mr. Turner's question? So many gardeners either lack the opportunity or lack the wish to make any sorting out of their plants according to flowering season. The winter-flowering plants that Mr. Turner mentions are in most good gardens; but they are seldom brought together into one place where they can make a concerted effect of floweriness at the least flowery time of year. It requires planning to bring, say, *Rhododendron præcox* into company with *Erica darleyensis*, and even if one has the wish to avoid this haphazard mixture, some gardens do not lend themselves easily to division into convenient units. The principle of sorting out plants more or less according to their season of beauty, which Mr. Turner (and to so notable a degree, Miss Jekyll) has applied, is surely the best, though it does not suit everybody.

Another reason why one does not more often see winter gardens is, I imagine, that the necessary shelter and enclosure is often difficult or costly to secure. The delightful walls which keep Mr. Turner's winter flowers unbroken in the gales and make the seat a pleasantly warm place on the first mild February days involve a considerable outlay in these post-war times, and walls are better for this purpose than hedges, though, of course, a hedge will serve. I see Mr. Turner speaks of *Erica carnea* as the carpet to bushes of *Rhododendron præcox*. I wonder whether he has tried *E. darleyensis* (*E. mediterranea hybrida*); to my mind, though *E. carnea* is good with *R. præcox*, this cooler-coloured Heath is even better.

One other question. Among the shrubs permitted in the small enclosure of Mr. Turner's garden, does that beautiful little plant, *Corylopsis paniculata* find a place, as it deserves? Perhaps it flowers a little too late.—A PAINTER.

COLOUR HARMONY IN THE ROCK GARDEN.

WHEN writing in THE GARDEN of April 28 on the happy association of orange colour with the *Aubrietia* and flowers of a magenta tint, I quite intended to have mentioned *Cheiranthus Allionii*. Mr. St. John Irvine recently wrote that he considered "G. K. Chesterton was sent into this world for the exclusive purpose of saying the opposite to Bernard Shaw. He has to restore the balance which Mr. Shaw so vigorously disturbs." Be this as it may, it certainly seems that this Siberian Wallflower, with its dwarf habit and peculiarly penetrating tone of deep orange, was sent into the world to restore the balance which a magenta *Aubrietia* so vigorously disturbs! In passing, may I say that never have I seen *C. Allionii* and other Wallflowers in all their various tints used with finer effect than they are on "the front" at Eastbourne at the present time. They are superb, and a fine tribute alike to the seed raisers and planter, for there is not a rogue among them in all the separate colour groups. Here and there among them a patch of *Aubrietia* is grown, appearing like an amethyst and accentuating their rich warm tones. From some gardens,

Lunaria biennis is now excluded, but to my mind the use of Honesty is the best policy when it can be associated with its relatives the Wallflowers, particularly those with blossoms of the brown shades. The flowers of our old friend with the satin seed vessels then become not only bearable but pleasing, and the combination recalls that which we find in the wings of the Peacock butterfly. If I may just refer once more to trees bearing pink flowers to be used as a background for a pink portion of a rock garden, the introduction of the early-flowering Almond, the deep rose flowering Peach, the exquisite pink double Cherry with its graceful hanging clusters of blossom and bronze-tinted leaves and a late-flowering Apple will provide a pink-toned background for a long period.—H. H. WARNER.

RHODODENDRON

FALCONERI.

I ENCLOSE a photograph, taken in my garden in Ross-shire the other day, of a plant of *Rhododendron Falconeri* bearing eighty-nine flower trusses.—WM. R. T. HANBURY.

THE COLIN-PULLINGER MOUSE TRAP.

I WONDER how it is that your correspondent who wrote some months ago was so successful with the Colin-Pullinger mouse traps. I have tried them since seeing his letter in every possible position, where mice are swarming round, but have never succeeded in catching one, though I have tried other forms of bait as well as the aniseed. Last night they even ate through the cork to get at the linseed in a large tin, though the trap was baited with it.—(Mrs.) B. K. GOTT.

[The Editor had one of these traps placed at his disposal by the makers, but was not successful with it. The idea is sound, but in the sample under test the balance did not seem to be sufficiently delicate. There is no doubt whatever that traps of this pattern have given splendid results, but especial care is necessary in manufacture.—Ed.]

PELARGONIUMS WITH BEAUTIFUL FOLIAGE.

LOOKING back on the days when Pelargoniums with beautiful foliage were grown with a certain amount of enthusiasm (fifty years ago!), recalls to my mind varieties that are now seldom heard of, much less seen. They were employed for bedding in public parks then, but did not leave cold frames much before the middle and often not before the end of June. Then it was the practice to bury the pots, the reason for this being that the growth of the plants was so slow and the plants themselves more valuable than the usual run of "bedding-out" stuff, so that no risks could be taken with them. More than once, I remember, they were hurriedly lifted in mid-September and taken back to the warmth of the greenhouse. Some enthusiastic cultivators of these fancy-leaved sorts grew them solely for indoor decoration, and under glass the richness of the foliage was greatly enhanced. About the time of which I write—the early 'seventies—my father was very much

enamoured of many of the sorts and devoted one side of his greenhouse to them. The curious thing to me, as a lad, was that he would not allow any to bloom, but pinched out the buds as they appeared, telling me that "the leaf was the flower"; a practice, I afterwards learnt, that was followed by others who grew "tri-color Geraniums." The names of some of the sorts occur to me now,

A FINE PLANT OF RHODODENDRON FALCONERI.

though the majority I have not seen for many a day. They are: *Silver tricolors*: Prince Silverwings, Dolly Varden, Mrs. Laing; *Golden tricolors*: Mrs. Pollock, William Sanday, Macbeth; *Bronze bicolors*: Maréchal MacMahon, Black Douglas; *Golden edged*: Golden Chain, Crystal Palace Gem. Then came sorts like Cloth of Gold, mostly yellow leaved and white edged varieties, such as Bijou and Flower of Spring, the last named being in vogue to-day.

I have a distinct recollection of seeing a collection of Bronzes and Tricolors at a show which excited a deal of admiration because of their highly tinted leaves, but there was not a single flower among the whole of them. Greenhouses were not quite so numerous fifty or more years ago, so that the fancy-leaved Pelargoniums did not come within the scope of the ordinary amateur, as the Carnation and Chrysanthemum do to-day, for instance.

One sometimes wonders whether these beauties of bygone days will ever be revived? The last time I saw any quantity of them bedded out was in the Arboretum at Nottingham and that is a long time ago. "Pearsons of Chilwell," famous about the time mentioned for Zonals, grew the "fancies" also, but not, I think, to the same extent. So far as Zonals were concerned their name in the Midlands was a household word and their nursery within a few miles of Nottingham was visited by members of the fancy.—W. LINDERS LEA.

THE SEA MILKWORT

NOT often does one see a note in the journals devoted to gardening matters on the tiny little plant called *Glaux maritima*, and yet it is a sweetly pretty little plant which has its uses, and possesses merits peculiarly its own. It is, of course, a seaside weed, and when seen at all (in a wild state) it is in far-reaching masses that carpet the ground for a great distance. It is not upon the sandy beach or rocky cliffs the Sea Milkwort grows, but upon the moist, boggy marshes over which the tide flows at intervals and ebbs again, to leave the roothold of the plant in a sticky,

muddy condition. It is therefore apparent that the plant likes two things—moisture and salt. What can be more useful for covering the mud around the verge of a pond, or what will so charmingly clothe the sundry bare spots in the little home-made bog garden? A plant with slender, prostrate stems as green as grass, closely set with

tiny stemless leaves, relieved by starry blossoms of a delicate rosy lilac hue. Whether or not the salt shall be provided is largely a matter of choice, but I have found an occasional slight sprinkling thereof puts vigour and life into the plants. It will spread and increase rapidly when once a start is made.—A. J. MACSELF.

GARDENING OF THE WEEK

FOR SOUTHERN GARDENS.

Fruits Under Glass.

Peaches and Nectarines.—The fruit in the early houses is approaching the ripening stage, a remark that applies both to pot trees and those planted out. The amount of atmospheric moisture should be reduced and the fruit exposed to full sunlight, which can usually be done by removing a few of the leaves near the fruits. The roots should be kept moist and air admitted more freely whenever the weather is favourable, an inch or so from the top ventilators being left on throughout the night. Work in the later houses consists of disbudding and tying in the young shoots.

The Orchard-House.—In this structure a miscellaneous collection of fruit trees is generally grown. For the centre of the structure pot trees, such as Peaches, Nectarines, Plums, Apricots and Cherries are usually selected, and now they are swelling their fruits freely the roots must be kept moist and liquid manure given three or four times a week. When the fruits begin to colour this should cease, and at this stage, careful watering is essential or the fruits may split. When the weather is hot the trees will need syringing freely twice each day, once in the morning and again in the afternoon, but no spraying will be needed when the fruits approach maturity. Keep the trees free from insect pests, but fumigation is not recommended when the fruits are ripening.

The Hardy Fruit Garden.

Morello Cherries.—These are invaluable for a north wall, and they invariably bear a good crop if the trees are properly treated. It is during the summer months that a foundation is laid for next year's crop, and it should be borne in mind that, as with Peaches and Nectarines, the fruit is produced on the shoots that are made this season. Disbudding must be resorted to, and the observant grower will see where shoots are wanted to replace those that have borne fruit and if any growths are needed to furnish a blank space or extend the tree. Disbudding must be done gradually, and the growths that are left must not be overcrowded. Keep the trees free from aphides.

Strawberries.—In many gardens this is one of the most important fruit crops. The beds must be cleared of all weeds and a liberal dusting of soot or lime sprinkled between the rows and around the plants. It will to a certain extent check the ravages of slugs. Afterwards clean straw should be used among the plants to protect the fruits from being spoilt with soil during heavy rains. Preparations ought also to be made to cover the bed with netting, and the best plan is to arrange it in such a way that the fruit can be easily picked without removing the netting. A few stout poles will generally suffice to hold it in position. Fish netting will be found most suitable for the top and wire netting for the sides.

The Flower Garden.

The Iris Border.—In course of time the German and allied Irises become overcrowded and, in consequence, they do not bloom, while the growth is very weak. Where such is the case, the present is a suitable time to overhaul them. When the flowering season is past, lift them and divide into double crowns and transplant, in a fresh piece of ground if possible, about 1 ft. apart. Otherwise the same spot should be trenched and a quantity of rotten manure provided. The winter-flowering Algerian Iris (*I. vernalis*) has proved disappointing this year, very few blooms have appeared, and they were somewhat later than usual. It should be planted at the base of a south wall or in any warm corner, and it can be increased by taking pieces from established plants at this season. Old beds may be divided and replanted where necessary.

Bamboos.—These may be transplanted or divided at this season, and if the roots can be afforded water for a few weeks there is little fear of their failing to establish themselves. Small

pieces may be potted up and placed in a cool greenhouse where they can be syringed occasionally. These will make useful specimens for planting out next year. Bamboos are not particular as to soil, and most gardens contain suitable positions for them.

The Rose Garden.—The plants must be watched for aphides, and directly any are seen the sprayer must be employed and a weak solution of insecticide used, or the young shoots will be ruined. The grubs are also busy, and these are best destroyed between the thumb and finger. Disbudding should be resorted to if really fine blooms are required. Single Roses do not need this attention.

The Kitchen Garden.

Tomatoes.—If it is intended to grow Tomatoes in the open, it is time the plants occupied a cold frame to harden them off. Give them plenty of space and remove the lights on every favourable occasion, both day and night. An ideal position is under the shelter of a south wall, but with a warm season they will thrive in other parts of the garden if fully exposed to the sun. They should be grown to a single stem, securely staked, and when several trusses of fruit are set the centre of the plant removed. A space of 2 ft. should be allowed between the plants and 3 ft. from row to row.

Seakale.—Thongs that were planted out some weeks ago will need disbudding, selecting the strongest crown and removing the remainder. Keep the plantation free from weeds.

Spinach.—In a dry season the summer Spinach is almost a failure, and a good substitute is the New Zealand Spinach, which can be sown now in lines 2 ft. apart. Thin the seedlings when large enough.

General Work.—Peas will need staking, all crops to be kept free from weeds, and the hoe used at every opportunity. Sow seed of Turnips at fortnightly intervals, also Lettuce, Radishes, Mustard and Cress and summer Spinach, while Potatoes must be earthed up as they become ready.

T. W. BRISCOE

(Gardener to W. R. Lysaght, Esq.).
Castleford, Chepstow, Gloucestershire.

FOR NORTHERN GARDENS.

The Kitchen Garden.

New Zealand Spinach.—This plant makes a very good substitute for the ordinary Spinach. It comes in just as the latter is becoming worthless owing to the persistency with which late sowings run to seed. A well enriched south border suits the New Zealand Spinach best. As it spreads out rapidly, the plants—which may now be put out—should be planted about 2 ft. apart. When cutting it for use, only the thick, fleshy leaves should be taken; the stems should not be cut.

Broad Beans.—The plants obtained from the second sowing should now have some earth drawn up to the stems, and a sharp look-out should be kept for the black fly, which is partial to the tender, immature leaves. If this pest appears, the plants should be sprayed either with a solution of quassia chips or one of soft soap at the rate of a good handful of soft soap to an ordinary bucketful of water.

Cabbages.—Autumn-sown Cabbages that were planted out in March will now be making considerable headway, and should have some earth drawn up to the stems to prevent them from being loosened at the neck by high winds. If time permits, it will be well to have the quarters forked over—or dug if necessary—to be ready for the reception of spring-sown Cabbage and other members of the Brassica tribe in the beginning of June.

Asparagus.—Beware of cutting the plants too severely or too long. It should be kept in mind that every shoot cut means taking a liberty

with the plant, and it is only by cutting in moderation, in conjunction with liberal feeding, that the plants can be maintained in health and vigour for a prolonged period. Asparagus should always be cut with a proper "asparagus knife," for when cut with an ordinary knife, unless great care is taken, there is grave risk of damaging the roots. Another moderate dressing of agricultural salt applied in showery weather within the next two or three weeks will greatly benefit the plants.

The Flower Garden.

Tulips.—Early Tulips in beds should be lifted as soon as they pass out of bloom and be laid in by the heels thickly, so that, after ripening, the stronger bulbs may be retained for another season. The beds should then receive a moderate dressing of some light short manure and be dug over ready for the reception of summer bedding plants. The blooming period of May-flowering or Darwin Tulips may be prolonged by stretching tightly over a portion of the stock some tiffany or other light material. Cotton treated with linseed oil will be waterproof.

Early Chrysanthemums should be pinched to ensure a bushy habit. Run the Dutch hoe through them every fortnight, and it green fly attacks them dust them over with tobacco powder.

Pyrethrums.—These attractive June flowers require more than ordinary attention in the matter of tying, especially the doubles, of which the heads prove too heavy for the stems. Very light tying material, however, should be used for this work, as anything of a heavy nature looks very clumsy among such slender-stemmed flowers.

Hardy Annuals.—As soon as these are fit for handling they should be judiciously thinned, and the stronger-growing plants, such as Lavateras, Clarkias and Godetias should be thinned out to 6 ins. apart. Weaker plants, such as Nemophila, Nicotiana and Phacelia, may be left at from 2 ins. to 3 ins. apart.

Lawns.—If such strong weeds as Dandelions or Plantains make their appearance, they should be cut out with a knife and a little sulphate of ammonia or weed killer should be dropped into the spot in order to destroy the root. Little patches of Daisies should also be treated with either of the above, and the dead plants may be removed in a few days, after which a little sand should be dropped into the hole.

Fruit Under Glass.

Early Vines. The fruits which are on the eve of ripening, should receive a good supply of water at the root to carry them on until the crop is cleared. The atmosphere should be kept drier than was advisable earlier in the season, with more liberal ventilation.

Late Vines.—The work of first thinning should, if practicable, be finished before the work of planting out the summer bedders commences. The size of the bunch should not be reduced in thinning. Leave the berries at as uniform a distance apart as possible and beware of injuring the footstalks of the berries retained.

Melons in frames should be trained somewhat differently from those grown in a melon-house. Instead of training up a single stem the main stem should be pinched at an early stage to induce the plant to send out several leaders, and these should be encouraged to ramify over the "light" until sufficient female blossoms are developed simultaneously or within three days of each other.

CHARLES COMFORT

(Formerly Head-Gardener to Mrs. Haig, Broomfield, Davidson's Mains, Midlothian).

GREENHOUSE AND CONSERVATORY.

Begonia manicata.—Cuttings of this fine greenhouse Begonia should now be secured. They root readily in a close case with slight bottom-heat. This Begonia is best grown in an intermediate temperature. During their first season the plants should be grown on into 6 in. or 7 in. pots, when they will be useful for furnishing the stages in the conservatory. However, they are really at their best when grown on for a second year and potted on into 10 in. pots. They will then make specimens when in flower some 5 ft. in height. A group of such plants has now been in flower in the conservatory at Kew for four months. To attain such results the plants must be given greenhouse treatment whenever the flowers show signs of colour. This fine Begonia is nearly always spoiled by giving it stove treatment when in flower. Under such conditions it is over in six weeks' time, while the flowers are poor and pale in colour compared with the deep pink of the cooler-grown plants. Considering that this Begonia was introduced in 1842, it is surprising how seldom it is seen in gardens at the present day.

Keep your garden produce 'fit' with COOPER'S PREPARATIONS

WEEDKILLERS.

WEEDICIDE
Highly Concentrated Weedkiller.
Commended by R.H.S.
1 gal. dilutes to 100 gal. water.
1 pt. tin 2/-, 1 qt. 3/3, ½ gal. 5/6, 1 gal. 9/-

1-50 WEEDKILLER.
Similar to Weedicide, but half the strength. 1 pt. tin 1/8, 1 qt. 2/9, ½ gal. 3/9, 1 gal. 6/6

SPRAY FLUIDS.

NICOTINE (V2) SUMMER FLUID.
For Aphis, Apple Sucker, Capsid Bug, Woolly Aphis, Scale Insects, etc.
1 gal. makes 100 gal. Spray Mixture.
½ pt. 2/-, 1 pt. 3/6, 1 qt. 5/6, ½ gal. 10/-, 1 gal. 15/-

A.S. FLUID.
For Aphis, Apple Sucker, and young scale insects. 1 gal. makes 80 gal. Spray Mixture.
1 gal. 10/6, 5 gal. 42/6

ARSENATE OF LEAD PASTE.
For Leaf-eating Caterpillars, Codling Moth, Caterpillars and other chewing insects.

1 lb. 1/9, 2 lb. 3/4, 5 lb. 8/-, 10 lb. 15/3

FUNGICIDE.
An Improved Bordeaux Mixture for Pear and Apple Scab, Potato "Blight" and other fungoid diseases.

1 lb. tin 1/-, 5 lb. tin 3/6, 10 lb. 6/-

TOMARITE.
Non-poisonous spray for Tomatoes. Remedy and preventive of fungous diseases of external origin. Does not mark the fruit. 1 g.l. makes 200 gal. Spray Mixture.

½ pt. tin 1/6, 1 qt. 5/-, 1 gal. 14/6, 5 gal. 65/-

MILDEW (V2K) FLUID.
For Rose, Strawberry and other Mildews, also for Strawberry Leaf Spot.
1 qt. tin 4/-, 1 gal. 9/6, 2 gal. 17/6, 5 gal. 37/6

This New Continuous Sprayer

These illustrations clearly show the unique features of this New Sprayer, including detachable Barrel and adjustable and detachable Jet. The Spray is CONTINUOUS and suitable for use with Insecticides for spraying Roses, Fruit Trees, etc.; also for Disinfectants, Fly-killing compounds, etc., in Houses, Factories, Workshops, Ships, Cinemas, &c.
The Jet may be varied from a coarse spray to a very fine mist by merely turning an adjusting screw; every part is easily detachable and accessible for cleaning purposes, and all working parts being interchangeable can be renewed at small cost.

Undoubtedly the finest mist Sprayer on the market.

BENSON'S GARDEN HOSE

SPECIAL 1923 OFFER.

All Hose is made 60ft. lengths. **BEST HAND-MADE GARDEN HOSE**, 60ft. best Red or Grey ½, with all best Brass Fittings, **18/6 COMPLETE**. This is Hose much superior to the common drab quality usually sold.

"SPECIAL RED" or GREY HOSE.

60 ft. ½ in., fitted with Branch Rose and Jet and Royle's pattern Tap Union, **22/6**
60 ft. ¾ in., " " " " " " " " **26/6**
60 ft. 1 in., " " " " " " " " **32/9**

This Hose is very superior, both in make and finish, to anything of the kind hitherto made. The rubber inside is seamless, thus avoiding the possibility of splitting or opening of seams which occurs with the ordinary make; also, being well frictioned on to the canvas during the process of manufacture, it is not liable to peel off. It is calculated to stand much greater pressure than the ordinary Hose, combining lightness with strength.

THOMAS GREEN & SON, Ltd., Smithfield Ironworks, Leeds, and New Surrey Works, Southwark Street, London, S.E.1.

Begonia coccinea was introduced the same year as the above, and is also a very fine Begonia for the greenhouse. It belongs to the suffruticosa section and may be propagated at any time by means of cuttings of the short side-shoots. While young this plant may be used for furnishing the stages, but is seen at its best when grown on as a large specimen into 10in. or 12in. pots. It then throws up great stout cane-like shoots 6ft. to 8ft. in height. It may also be planted out and trained up a pillar or rafter, which it will clothe to a height of 10ft. to 12ft. and flower more or less all the year round.

Berberidopsis corallina.—This beautiful plant, although hardy on a wall in the West, is ideal for planting out in a cool conservatory or greenhouse. It may be trained up a back wall or even on a rafter. A cool position is preferable, as it is somewhat subject to attacks by red spider. This plant grows quite well in any good potting compost, and can easily be propagated at this time by means of half-ripened twiggy side shoots dibbled into pots of light sandy soil and stood under a bell-glass in a cool greenhouse.

Eupatoriums are very useful greenhouse plants, which should be propagated towards the end of this month. Plants of *E. Rafinii* in 6in. pots that have been used for the stage make fine large specimens for standing on the ground if they are grown on into 8in. or 10in. pots, or they may be planted out in a bed or border in the cool conservatory. *E. macrophyllum* may also be treated in the same way. *E. lanthum* is a smaller and slower-growing plant, which is at its best during its second year. All those mentioned produce large heads of bluish purple flowers and remain in flower for a long time. They are easily propagated by means of short lateral shoots, placing the cutting pots in a close case with slight bottom-heat. They are best grown in a temperature of 50° to 55°. The following species produce white flowers, and are best grown in a somewhat lower temperature. *E. grandiflorum* is rather slow growing, and is best during its second year. *E. petiolare* is a beautiful fragrant species which, if propagated at this time and grown on into 8in. or 10in. pots, will make fine large specimens for winter flowering. If small plants are desired for the stages, they may be propagated as late as August. For this purpose good examples may be grown in 6in. pots. *E. riparium* is an easily-grown species with slender drooping shoots. *E. Weinmannianum*, generally known as *E. odoratum*, is a shrubby species which is very useful for autumn flowering. By pruning it hard back early in the year and growing it on, the same plants can be grown for a number of years, and in time make fine specimens. This species is easily propagated by means of cuttings of the young shoots during the spring months. The young plants should be stopped several times to induce a bushy habit. Such plants grown in 5in. pots are very useful for furnishing the stages during the autumn. They are best grown in cold frames during the summer, while the larger plants should be stood on an ash bottom outdoors.

Begonias of the tuberous-rooted section raised from seed this year should now be planted out in cold frames. Later on, when they have made good growth, some of the strongest plants may be lifted and potted up for autumn. Such plants make a good succession to the plants grown from old tubers. They enjoy rich free compost, and should not be potted too firmly.

Royal Botanic Gardens, Kew. J. COUTTS.

OBITUARY

F. JORDAN.

EXHIBITORS at the Royal Horticultural Society's Hall, Westminster, will learn with regret of the death of Mr. F. Jordan, caretaker of the hall from its erection in 1904 until 1921, when he retired owing to failing health. He was always a willing worker, and ready to assist exhibitors and visitors. He died at Crofton Park, S.E., where he resided, and was buried at Ladywell Cemetery on May 3.

CATALOGUES RECEIVED.

Mr. Elisha J. Hicks, Hurst, Berks.—Roses, The Welsh Bulb Fields, St. Asaph, North Wales.—Daffodils, Tulips, etc.

A Charming Dwarf Rhododendron.—A very slow-growing, diminutive Rhododendron from the Himalayas is *R. glaucum*. It is, withal, a perfectly hardy, easy-tempered little shrub that does quite well in any cool, lime-free loam, where it will seldom exceed 2ft. in height or diameter. It is compact and shapely in habit, and the evergreen, rather blunt, or rounded, leaves are a dull green above and white beneath. The flowers, which are produced in small, loose, terminal clusters in April, are large for the size of the plant, being some three-quarters of an inch across, bell-shaped and fragrant. This is a useful rock garden plant and one that associates well with any of its allies of lowly stature.

A Spreading Cotoneaster.—Cotoneasters, with their wealth of glorious berries, are highly valued for garden and house decoration and lavishly used wherever ornamental shrubs are appreciated. A comparatively little known one is the tiny adpressa, a splendid plant for the rock garden, where it makes a close, compact little bush 1ft. to 1½ft. high, that is effective from May to late autumn. Though so dwarf in stature, the plant is in no way a mean one in appearance for it spreads widely, and old established specimens cover several yards, rooting here and there as they spread. The leaves are in opposite rows, dull green in colour, with white flowers produced singly, and remarkable in that they do not open very widely. These flowers are followed by bright orange-red berries in autumn, that persist for a long time and become very conspicuous indeed as the foliage falls.

ANSWERS TO CORRESPONDENTS

QUESTION AND ANSWERS.—All communications should be clearly and concisely written on one side of the paper only, and addressed to the EDITOR OF THE GARDEN, 20, Tavistock Street, Covent Garden, London, W.C.2. When more than one query is sent, each should be on a separate piece of paper. Plants for naming should be clearly numbered and securely packed in damp grass or moss, not cotton-wool, and flowering shoots, where possible, should be sent. It is useless to send small scraps that are not characteristic of the plant.

FLOWER GARDEN.

SWEET PEAS UNSATISFACTORY (F. G. F., Birwash).—The leaves sent were too much dried up when they arrived to enable us to come to any just conclusion concerning them. They appear, however, to be suffering either from streak, for which at their age there is no adequate treatment, or from some wrong cultivation, such as watering or ventilation, being amiss.

ANEMONES AND THYME (R., Surrey).—After taking up the Anemone roots, in due course ripening them in a cool, well aired place and not exposed to the direct rays of the sun, place them in bags for two months or so, also in a cool, dry building. As our correspondent may be obliged to keep the roots out of the soil longer than usual,

they may be started in shallow boxes and covered with loam and leaf-soil mixed, planting out in due course. Mark the position with a stick, in the case of Anemone rugens, and lift the roots a little later on, otherwise treat them as advised for *A. blanda*, etc. Light, well drained soils are the best. The Thyme may be transplanted from the open ground. If the centre of each clump be opened and sandy soil placed there now, many new roots will form, ensuring tufts of young plants by end of summer.

TULIPS (Polsted).—Prince of Austria is, of course, an early-flowering variety; the bulbs mature early and should be lifted, gradually dried and stored in paper bags. We have some which have flowered annually for eight years, but the border is a raised one, and the flowers are smaller each succeeding year; the bulbs have not been disturbed during that time. In a wet soil the bulbs would perish sooner. In the case of the two varieties of late-flowering Tulips, namely *Gesneriana spatulata* and *macrospila*, there is not any appreciable difference in hardiness, and both would do well left in the ground for four or five years.

TREES AND SHRUBS.

THE PRUNING OF BROOMS (W. J. T., Blane-field).—To prevent Cythuses, Gonistas and Spartium from becoming leggy it is advisable to prune a little each year after flowering. It is necessary, however, to do this from the time the plants are not more than 1ft. high, as satisfactory results only follow the pruning of the smaller twigs. Cutting hard back into the old wood as one can do with many shrubs is seldom satisfactory with Brooms.

PRUNING THE YELLOW AND RED BARKED WILLOWS (W. J. T.).—The hard pruning of these Willows must be done not later than March or April. The bareness of the ground during spring and early summer can be overcome by carpeting the ground with an easily cultivated bulb, such as the Spanish Bluebell, *Scilla campanulata*, Hyacinthus Heavenly Blue, *Muscari comosum* or *Ornithogalum nutans*.

FRUIT GARDEN.

PEACH LEAF-CURL (F. J. T.).—The Burgundy mixture may be used for spraying Peaches against leaf-curl at any time, but is most effective if applied in mid-February.

PEAR FOR IDENTIFICATION (W. M. F.).—This Pear is Uvedale's St. Germain, *Easter Beurré*, which it is suggested this might be, is roundish oval and even in outline, and quite unlike the fruit sent. We can only suggest that the reason that our correspondent found it so unsuitable for cooking was that it was used when it had passed its proper season. It is at its best in February and March, and after this becomes very tough and difficult to cook well. It was right to leave the crop to hang as late as possible, but the pears were not allowed to be frozen, we hope.

MISCELLANEOUS.

HOW TO TRAP WEEVILS (W. T. D.).—The best way to treat the weevils would be to shake the plants they frequent over an inverted umbrella after dusk and so to capture them. Handfuls of clover dipped in lead arsenic placed on the soil might trap and kill a good many. The other beetle sent is unlikely to do harm. It belongs to a group of carnivorous beetles, and is much more likely to be useful than harmful.

NAMES OF PLANTS.—M. A., Semley.—*Narcissus poetianus poetianus*.—C. V. B., Cornwall.—*Pittosporum tenuifolium*.—L. B. W.—*Thermopsis montana*.

THE 'HOME GARDEN' BOOKS

No. 5

ALPINE PLANTS

By A. J. MACSELF

Founder and first Chairman of the National Hardy Plant Society
Author of 'Hardy Perennials,' &c.

Illustrated with 8 beautiful coloured plates and a fine series of black and white drawings

This thoroughly practical work brings Alpine Plants within the reach of all. Even a rockery is shown to be not indispensable. This consideration for the busy flower-lover of limited means constitutes the book's great attraction, and its clear directions will be read and followed with enthusiasm. The author has spared no pains to make his work both lucid and comprehensive. Propagation is fully dealt with, and lists are added, classifying plants under such headings as their effectiveness in winter and their requirements in the matter of sun, shade, moisture, &c. 'ALPINE PLANTS' affords help for both the expert and the beginner.

A CONVINCING TESTIMONIAL.

"I am very pleased with the Greenhouse. I have had great
pleasure in showing friends the new house. No doubt you will
have to supply others before long. I shall always be pleased to
show any enquirers the house, and can, with the greatest con-
fidence, recommend your firm for good-class work and atten-
tion. I may require others later, and will send direct to you."

"I am now awfully disappointed with my other houses I had
a few years ago from various other firms. I cannot now admire
them after seeing yours erected."

Can be erected by a youth in 90 minutes or less.

Can be taken down in same time when required
without removing a single pane of glass.

An "Ideal" House for an "Ideal" Garden.

SEND FOR LIST.

THIS House is not a shoddy and poorly constructed house that gives you
great difficulty in erecting, and when erected is an everlasting eyesore; such
a house would disfigure any garden.

You require a house that is built for utility and to be an ornament in your garden, in which case select the
"IDEAL," which is constructed of the best materials, in the best possible manner, and with which there is no difficulty
in erecting, being despatched assembled as far as possible, nothing whatever being left to be done on the site that could
conveniently be done here.

GARDEN FRAMES.—Prepared of well-seasoned Red Deal.
Lights 2 in. thick, glazed with 21 oz.
glass. All painted three coats. Lights fitted with handle and iron cross bar,
bolted together. Other sizes quoted for. Carriage Paid.

THE WORST OF ORCHARD PESTS,

Psylla Mali (Apple Sucker), the tiny insect which attacks and destroys opening apple blossom buds, will shortly make its appearance. Nico Soap is the remedy and stocks should be procured at once. There is nothing so good as Campbell's English-made Nicotine Insecticides for destroying all sucking insects.

CAMPBELL'S ENGLISH NICOTINE, 95-98 per cent. guaranteed, prices on application.

CAMPBELL'S NICO SOAP (Nicotine Soap). The best Potash Soft Soap plus 7½ per cent.

Nicotine, unrivalled for syringing or spraying. Prices—½ lb., 2/-; 1 lb., 4/-; 10 lb., 32/-

CAMPBELL'S NICOTINE VAPORISING COMPOUND. Nicotine content, 50 per cent.

Prices—10z., 1/6; 40z., 3/9; 80z., 7/6; ½ pint, 9/-; 1 pint, 17/6; ½ gallon, 61/-.

CAMPBELL'S NICOTINE FUMIGATING ROLLS, very simple and effective. In four sizes, for 500, 1,000, 2,000 and 3,000 cubic feet. Prices—7d., 10d., 1/6 and 2/- each.

CAMPBELL'S PATENT SULPHUR VAPORISER. The best method of exterminating Mildew from plants in greenhouses. In two sizes, for 5,000 and 10,000 cubic feet. Prices—18/- and 20/- each.

CAMPBELL'S LEMON OIL INSECTICIDE, splendid for sponging, dipping, or syringing stove and greenhouse plants. Pints, 2/3; quarts, 3/10; ½ gallon, 6/10; gallon, 12/- each.

CAMPBELL'S WEEDKILLER. One gallon makes 51 gallons for use. Per gallon, 7/-; 2 gallons, 13/-.

Obtainable from Seedsmen or, in case of difficulty, direct from the Manufacturer,

J. D. CAMPBELL, Nicotine Manufacturer,

LADIES' FIELD
FASHIONS

The Ideal Dress Journal for the Modern Woman

Every issue of "Ladies' Field Fashions" presents the newest season's modes adapted to the needs of the smart woman of to-day. Prominent Fashion Artists picture in terms of simplicity and smartness the latest creations from the acknowledged centres of fashion, whilst style experts advise authoritatively on all matters of dress. An exclusive feature every month is a beautiful Colour Supplement picturing a variety of charming and wearable styles.

Published 26th of every Month - - PRICE 1/-

Glass House Building

THE building and designing of Glass Houses is a highly specialised work—that is, if the structure is to be correctly designed, and built to last.

In dealing with the firm of Duncan Tucker & Sons, Ltd., you are obtaining the combined experience of many years devoted exclusively to the erection of every form of Glass House, ranging from the modest "Lean-to" to the expansive Winter Garden.

Whether your enquiry is for renovating an existing Glass House or designing a new one, you will receive the same courteous and prompt attention.

Those contemplating the erection of a new Glass House are invited to send for a free copy of an illustrated Brochure entitled "The Charm of Perpetual Summer." This Book, handsomely illustrated from actual photographs, contains much useful information relating to the design of Glass Houses for specific purposes, and their upkeep.

Notes from Maidstone.

THE CALL of SPRING
At no time is the call of the garden more clamant than in those lengthening days when April turns to May. The weevil now leaves his watery nest and turns to seek his mate; the aphid, long immured in her dark egg, creeps out to fulfil urgent domestic calls.

But what is life to the weevil is death to the fruit & death's avenging hand may not be stayed.

Timely advice on such lethal matters is contained in our pamphlet on *Pests of Orchard and Garden Crops*—1d. post free.

NO. 2688.—VOL. LXXXVII.]

[MAY 26, 1923.]

THE PLANTING OF DRY WALLS

THERE was a time when all the vegetation to be found on garden walls was due to natural causes. The writer must confess that there have been times when he has wished that the idea of introducing plants into walling had never originated. In just the same way that he yields to none in admiration of the Ivy but cannot bring himself to believe that it was intended to obliterate or destroy beautiful material, so cannot he appreciate the motive of those who would build a handsome wall merely to hide it effectually from view by a miscellaneous assortment of rock plants.

The illustration on this page shews a small portion of a garden wall at Gravetye with a single clump of purple Aubrietia. Observe the delightful form of it and contrast it with the higgledy-piggledy huddle of Alyssum and variously coloured Aubrietias often seen! Not that any objection can be sustained against an informal grouping of Aubrietia in walling; this is an entirely natural-looking arrangement, and a certain amount of grouping is absolutely necessary if spottiness is to be avoided. When Nature plants walling solidly it is almost always with small-growing things, such as the Ceterach, which adorns so many field walls in Wales. The little colonies of the Pennywort, Cotyledon Umbilicus, or of Sedum acre, often seen on walls in the West Country, adorn the walls they clothe, and allow one to appreciate the patina which always appears on old stone.

The most obvious plant to grow on a wall is, one would suppose, the Wallflower, yet on planted walls one seldom sees it. In the free rich root-run of the garden beds this plant is short-lived and only worth treating as a biennial, but in the fissures of natural rocks, or in the joints of walls, it is more compact of habit and more enduring; moreover, it will establish itself from self-sown seeds. The yellow varieties are, on the whole, more perennial and suitable for walling than the crimson ones, but the latter are very effective and worth trying. The brilliant orange Cheiranthus Allionii, crudest in colouring of the Wallflower family, is also first-rate on walling, and is easily

introduced by seeds sown *in situ*. The Valerian, Centranthus ruber, is another plant which seems to be made for walls. It is tap-rooted, and so is best raised from seeds sown in the wall itself, preferably in autumn, and covered with a pinch of soil. It always looks well either on a wall or planted just at the foot so that its roots can reach the joints between the courses of the walling.

The picture on page 254 will display Androsace sarmentosa in a new light to many gardeners. This is, we all know, an admirable moraine plant, but it is also excellent for the retaining wall or rock garden "cliff," and its silvery rosettes and primula-like umbels of blossom are thus seen to

singular advantage. Other Androsaces belonging to the sarmentosa section are equally suitable for the dry wall, notably A. primuloides and the not very dissimilar A. Chumbyi (sarmentosa \times villosa), of which there are now several distinct forms. Perhaps the best of these is Brilliant, which is considerably livelier in colouring than the type.

The Alpine Phloxes do exceedingly well in walling, and though the forms of P. subulata are not very long-lived, yet they make stockier growth and remain "respectable" longer on a wall than (in possibly too rich soil) on the flat. Beautiful as these plants are, however, they do not seem as suitable for walling as do Antirrhinums, for instance. A tendency has been noticeable of late to confuse plants for walling with rock plants. It must to some extent destroy the sympathy with which one inspects a rock garden if one has already seen the classes of plants which form its principal features adorning walls in the more formal parts of the garden.

Mention has been made of Antirrhinums or, as we should prefer to call them, Snapdragons. How often does one see robust specimens of this cliff-loving plant growing from an old mortared wall a number of feet above ground-level. Often as one may see them, one cannot refrain from speculating on each occasion as to whence they obtain sufficient moisture to supply their bulk of leafage. Such plants, of course, are self-sown, and the Snapdragon is best introduced to a dry wall by sowing the seeds direct into the fissures. The old plants usually persist for several seasons in so congenial a situation and, if some of the seed-pods are not removed until the seeds are shed, it is unlikely that there will be any shortage of young plants to take their place when at length they perish. The writer once saw a wall entirely planted with Antirrhinums. The plants did magnificently, but, on the whole, it was not an inspiring sight. At risk of wearisome reiteration let us repeat that the function of wall-planting is to adorn, not to obliterate. If a wall built of ugly materials needs obliterating, it is, unquestionably, better to use Ivy or some other plant which will furnish

AUBRIETIA ON A WALL AT GRAVETYE.

THE HARDY DAPHNES

THERE are about thirty-six known species of *Daphne*, of which about half have been, or are, in cultivation. They are natives of Europe and Temperate Asia, some being plants of the lowlands, while others are inhabitants of the higher alpine regions. *Daphnes* have the reputation of being difficult to manage in cultivation, and many of them in our gardens prove to be short-lived plants. As, however, several kinds are very beautiful, a little extra trouble is well repaid if they can be successfully established.

Although commonly described as peat-loving shrubs, experience proves that a sound fibrous loam with which is mixed a good proportion of sharp gritty sand, is best for the majority, while the smaller kinds benefit by the addition of leaf-mould and stone chippings. All *Daphnes* thrive best in slight shade, but they will do without it if the soil is fairly moist. Stones in the soil help to keep the roots moist, and some advocate the practice of covering the prostrate stems of *D. Blagayana* and others of similar habit with large stones, thus inducing them to root afresh. They are not deep-rooting plants, but usually make a thick mat of fibrous roots just below the surface. It thus follows that they are not able to withstand the dry conditions of a sunny aspect.

All the semi-prostrate kinds are readily propagated by means of layers, which root freely and soon make good plants. Cuttings also root if they are inserted in a mixture of sandy loam in the autumn and placed in a cold frame. The young growths also may be rooted by means of heat in spring.

All the species of *Daphne* are deliciously fragrant, some of the best in cultivation being given below.

D. ALPINA.—This is a dwarf bushy species, 1 ft. high, from the European Alps, of evergreen habit, the flowers of which are produced in tiny white clusters in May and June. It is fairly easy to manage, preferring to grow in a rocky crevice or on a well drained ledge in the rock garden. It will stand full sun if it has a moist root-run.

D. ALTAICA is a small bushy plant, 1 ft. high or more, with obovate glabrous leaves of a somewhat glaucous or yellowish green colour. The white flowers are borne in terminal umbels of five in April. This plant is a native of Siberia.

D. ARBUSCULA.—This plant is closely allied to *D. petraea*, but has broader, longer leaves and larger rose pink flowers, which are produced in May. It is a dwarf shrub, growing only 6 ins. or 8 ins. high, with evergreen foliage and said to be found growing in grassy places in the European Alps.

D. BLAGAYANA is a prostrate evergreen shrub from the mountains of Carniolia. This species has proved a difficult plant to establish in many places. It is of lax habit, each branch terminating in a cluster of fragrant, white or cream-tinted flowers in April. It delights in shade and leaf-soil, but in western districts where moister conditions prevail it thrives in fuller sunshine. It is a plant for the lower parts of the rock garden or shady border, and is one of those kinds which benefit by placing stones on the branches as they develop.

D. CAUCASICA is similar in habit to *D. altaica*, with clusters of white or cream-coloured flowers. It is found in the Caucasus.

D. CNEORUM.—The Garland-flower is a native of the Alps of Europe, and is the most attractive

of all the species. It forms more or less compact bushes of evergreen foliage, and in May it produces its terminal clusters of fragrant rose pink flowers in abundance. Although said to be granite, it is, like many of the others, a lime-loving plant in limited quantity, thriving in a good loamy soil

THE FRAGRANT DEEP PINK DAPHNE PETRÆA.

with plenty of decayed leaves and sharp grit. For the shady parts of the rock garden it is a charming plant, of which there is a pure white variety as well as one with variegated foliage. *D. C. var. Verloti* is a form with narrower leaves from Mt. St. Eynard, near Grenoble.

D. COLLINA is a native of Italy, and forms an erect evergreen shrub from 2 ft. to 3 ft. high, with deep green leaves, glabrous above and hairy beneath. The deep pink flowers are produced in terminal heads in early spring and are deliciously fragrant.

D. GENKWA.—This is a somewhat tender species which only does well in the western parts of this country. It comes from Japan, forming a loose bush 2 ft. to 3 ft. high, and bears in April and May long sprays of fragrant lilac-coloured flowers.

D. GIRALDI.—This plant was first collected by Père Giraldi, after whom it was named, in Northern Shensi in 1894. It was also found in Western Kentsu by Mr. W. Purdom at elevations of about 6,000 ft. He sent seeds home to Messrs. Veitch, by whom it was introduced into cultivation. It has proved hardy, forming a bush 2½ ft. to 4 ft. high and as much in circumference, producing its golden yellow flowers in capitate clusters at the tips of the branches. Like many of the other species, it is propagated by means of layers and cuttings.

D. LAYRLEA, the common Spurge Laurel, is a well known plant with its evergreen foliage and citron yellow flowers. It is a good plant for the shady woodland and is easily naturalised.

D. MIZURUM.—Also a well known and favourite plant, which does much better in the cooler conditions of the north. It may be established in a partly shaded position in the rock garden and

THE GARLAND-FLOWER, DAPHNE CNEORUM

grows on a loam soil containing limestone boulders. In such situations it will thrive, and self-sown seedlings frequently appear. From 2 ft. to 3 ft. high it forms a bushy plant, the leafless branches being covered in spring with clusters of fragrant rosy pink flowers. There is also a pure white form of this, as well as one with deeper coloured flowers.

D. PETRAEA (syn. *D. rupestris*).—This is a charming little species from the Tyrol which forms a low-growing bushy plant only a few inches high with dark green evergreen foliage. Its rosy pink flowers are produced in terminal clusters during April and May. It is frequently grafted on the stocks of *D. Mezerium*, and handsome little bushes are quickly produced. The illustration shows one treated in this way. It thrives under the same conditions as *D. Cneorum*, and is also an excellent pot plant.

D. RETUSA.—A native of Western China, this was first discovered by Mr. Pratt in 1880 in Western Szechuen at 13,000 ft. elevation. In 1903 it was again collected by Mr. E. H. Wilson, who sent home seeds to Messrs. Veitch and Sons, by whom it was raised. It forms a compact evergreen shrub 18 ins. high with dark green, shining leaves, paler beneath. In April and May it produces umbels of fragrant flowers which are white inside and rose-violet outside.

D. STRIATA.—This plant grows along with *D. petraea*, forming masses of twig-like growths with narrow leaves. The rosy pink, scented flowers are produced in May and June. It has proved a difficult plant to establish.

D. LANGUTICA.—This is also a native of Western China, where it was first discovered by the Russian traveller, Przewalski in 1873. It was introduced into cultivation by the late Mr. Reginald Farrer in 1914. He found it in Kansu, and describes it in his notes as a dense low bush about 1 ft. high and wide, growing in open turf on calcareous loamy slopes at an elevation of 9,000 ft. to 10,000 ft. It is closely allied to *D. retusa*, but has umbels of red flowers, while the leaves are longer and proportionately narrower. It, like *retusa*, has proved quite hardy, doing well in shady positions in the rock garden. W. L.

MUNSTEAD BUNCH PRIMROSES

BY GERTRUDE JEKYLL, V.M.H.

THE present state of the Munstead strain of bunch Primroses is the result of about fifty years of careful selection. The colouring is confined to whites and yellows, but even within this restricted range the variety is remarkable. Some of the flowers are flat and nearly circular, others have their edges deeply indented; some have the appearance of being double, but this is only in consequence of the great width of the petal, which is not only deeply imbricated, but pleated at the edge with a richly fluted frilling. In a number of the flowers, especially in those clear pale yellows that may be called canary, there is no deeper coloured eye, the tint being even throughout; in others, both of the whites and yellow, the eye is strongly marked; in some cases with a restricted patch of colour next to the tube, while in others the colour runs out and covers a good half of the depth of the petal. Here, again, there is wide variety, for the edge of the stronger colouring may be sharply defined or it may be gently diffused by an imperceptible gradation. The primrose garden is in a clearing on the

MUNSTEAD POLYANTHUSES AT HOMER.

ANOTHER VIEW.

AND YET ANOTHER.

outskirts of which there are Oaks and Chestnuts, but when first prepared it was still too sunny and some Cob Nuts were planted to give inner shade. I had always noticed that the near woods where the wild Primroses abound have Oaks at intervals and a whole undergrowth of Hazel. This pointed to the kind of trees likely to prove the Primroses' best companions. As a further experiment, and with the wish to provide some dark background to the yellow and white flowers, some Hollies were also planted. This has proved a failure, as it was found when the Hollies grew up that no Primrose would thrive under their shade; but the Nuts have now grown so tall and strong that the Hollies may very well be abolished.

It would be of great interest to have another primrose garden in which to grow a good range of the strong-coloured kinds and to do the same with some good reds, but it has been found that it does not do to have coloured ones in the same garden, also we are debarred from growing the

giant Cowslips that are such good garden flowers, for the Cowslip influence is so strong that the bunch Primroses would soon be shewing some undesirable crosses.

Some of the flowers are of large size, well over 2 ins. diameter, and the stems may be 15 ins. high, but actual size is not so much encouraged as the general qualities that go to make a good garden flower, such as freedom of bloom, bold trusses on strong stems and good colouring. The growing of such a strain is full of encouragement, for no year passes without some distinct advance, either in colouring, marking or general desirable habit, and whereas a few years ago many plants were pulled up as unworthy of the general strain, now, among some thousands, there are barely a dozen that have to be rejected.

To do them justice they must have good and liberal cultivation. Our soil is the poorest sand, requiring yearly working and manuring; on a stronger soil they would be finer altogether.

and a cheerful bush of *Convolvulus Cneorum*. Still lower down we have a cluster of the common garden Sage, *Salvia officinalis*, with leaves of a rich plum colour dappled with white and rose, the same species in the variety *aurea marginata* and two Lavenders, viz., *Lavandula dentata* and *L. pectinata*. While this grouping has come into being somewhat "according to plan," the finishing touch has been given to it by an invasion of self-sown *Oxalis lutea*, which almost covers the arid soil between the shrubs with its lively green and large cowslip-like flowers, sparing, as it with intent, about a square yard at one open corner for seedlings of *Geranium sanguineum*, which are rapidly covering it.

In contra-distinction to the above there is a cool, mossy corner in the woodland in which the *pièce de résistance* is a bold clump of *Adiantum pedatum*, Klondike variety, and another smaller bunch of the typical form of that magnificent hardy Maidenhair. *Omphalodes nitida* gives a little colour, and there are a few small groups of *Anemones Hepatica* and *apennina*. The coolness and the greenness, however, is this particular spot's most abiding charm, features which are accentuated by the beautiful foliage of *Aquilegia formosa*, and, in later days, by the dainty fronds of Oak Fern (*Polypodium Dryopteris*), which are

SOME INFORMAL GROUPINGS

THERE can be few readers of this paper who are unacquainted with those certain portions of their gardens, or those of their neighbours, which make a special appeal by reason of the peculiar charm of their setting or the disposition of the plants which they contain. These groupings may, of course, be on any scale, but the satisfaction they afford is of the same kind, whether they are great or small. They may be the creations of direct design or the happy result of more or less random planting. The latter a—perhaps, often the more pleasing, and of those enumerated below none has been made to any set plan. Most have, in the course of years, "happened" to come into their present state, and, as I have suggested, their informality and natural, settled-down beauty is one of their most arresting charms.

A cool corner of the rock garden where a gentle slope is intercepted by the mossy heads of a few half-buried stones is curiously attractive this April day, yet it is strangely devoid of blossom. At the top is a little bush of *Spiræa Thunbergii*, wreathed in white flowers, while just below it the spikes of a lusty colony of *Tradescantias* are just beginning to show leaf. Over some of the stones *Linaria æquilobata* has crept and dappled its clinging veil of green with tiny violet flowers. In tufts of most delicate emerald *Euphorbia Cyparissias*—most insidious of spreaders—is pleading for the tolerance it usually succeeds in getting, and about it are some jaunty seedlings of *Geranium Loweii*, their crimsoned leaf stems glistening with silvery fur. Flat on the soil lie the large and ferny rosettes of *Spiræa Filipendula*, and there is a big clump of Bunch Primrose in full yellow near a mat of *Eriogonum umbellatum* at the foreground. To the right rise the grey-green shoots of *Aster pyrenæus*, over and beyond which tower the lovely foliage and golden poppies of *Stylophorum diphyllum*.

If there is not very much "display" in that rather unkempt little wilderness, it is one of those "fixtures" that one is loath to break up. Such a grouping will, naturally, be associated with something in the same general tone, and in point of fact it is, for close by we have a few plants of a remarkably good form of *Pulmonaria angustifolia azurea*, now at its best; some mats of *Saxifraga granulata*, always so beautiful in their young leafage; and just beyond these a group of *Pulmonaria* in white. There is a drift of *Aubrietia Lavender*, some strays from the woodland in the form of *Anemone nemorosa*,

some plants of *Corydalis lutea* and *C. ophiocarpa*, a wayward family of *Claytonias* with a Cowslip

A BUSH OF SPIRÆA THUNBERGII.

or two in a warm orange-red among them, and a progressive settlement of *Cornus canadensis* fast coming into evidence on the bank above.

A stone seat set into a low retaining wall at the foot of a hot, shaly bank is upholstered, so to speak, on one side with *Rosmarinus prostrata* and on the other with *Lithospermum rosmarinifolium*, the former in full bloom, the latter just going over. At the back there is a flopping cushion of *Thymus citriodorus argenteus*, a plant well worthy of wider cultivation, and the grey-leaved, lilac-blue *Veronica Whittallii*. Weaving its pretty purple stems and downy leaves in emerald and white throughout the above is gentle *Nepeta Glechoma variegata*, while adjacent parts of the wall, below and about the seat, are occupied by close-set tufts of *Iberis Pruiti*, some *Semprevivums* and *Erysimum limifolium*.

Higher up on the same hot bank of crumbling, stony soil there is a little collection of shrubs which have "made good" on the graves of many failures. To begin at the top, a bush of *Colutea arborescens* hangs forward towards a group of *Genista fragrans*, now a blaze of yellow. Below these come *Cistus lusitanicus* and *creticus*, three or four strong plants of *Diplacus glutinosus*

already getting restless beneath their mossy counterpane.

Another woodland "pocket" which has fallen into shape without any special laying-out consists, among other things, of a group of *Anemone Rolinsoniana*, *Vancouveria hexandra*, *Onoclea sensibilis*, some native Ferns, and other herbage and cushions of the pretty *Oxalis Acetosella rosea*. These practically form an unconventional foreground to a small collection of *Zenobia speciosa* and others of its race. There are rosy pink Wood Hyacinths on the rising ground above, while among the grass to one side *Cyclamen Coum* is in bloom and *Meconopsis cambrica* is coming into flower about some steps on the other.

These random notes must be brought to an end with the mention of two groupings on our heath bank. One of these consists of several large bushes of *Erica cinerea* var. *rosea*, all of them being threaded with the long and slender trailers of the elegant *Rosa Wichuraiana* and fringed with some lusty clusters of Wood Sage. The other is a warm, dry slope over which *Erica vulgaris* var. *cuprea* is smouldering in a coppery bronze. A bit of *Cotoneaster microphylla* put in here a few years ago to one side of the Heaths has made

great proportion of creeping and arching, cover the ground with cheerful freedom. The dark, glossy foliage serves as an admirable foil for the

colour of the Heath, and there is not a season in which this fine old species is not in itself an attractive subject. Very occasionally it may

have to suffer the loss of some ungainly growth, but beyond this it gets no attention.

North Wales.

A. T. J.

ILLUSTRATED FORECAST OF CHELSEA SHOW

VISITORS to "Chelsea" are always greatly attracted by the formal, informal and rock and water gardens outdoors, not because these comprise necessarily the best or even the most interesting exhibits, but because they form the one feature which is entirely distinct from anything shown at the very excellent Fortnightly Meetings at the Royal Horticultural Hall.

Already it is obvious that these outdoor gardens will be just as numerous and varied in conception as last year. The ambition to eclipse previous efforts is notably in evidence, and if the realisation is being made that this is likely to be brought about by good straightforward design and effective planting rather than by doubling the order for stone, lead and timber, which seems to be the case, so much the better.

Visitors to last year's "Chelsea" are unlikely to have forgotten Messrs. Bunyard's excellent formal iris garden. The firm are again building such a garden and, if it surpasses last year's effort, it will, indeed, be a notable exhibit. Whereas last year Messrs. Bunyard staged a section of a garden to scale, Messrs. Chisholm contented themselves with showing samples of gardens to something less than life-size, but suggesting the arrangement of the several parts a very important matter. The same idea is apparently moving them on this occasion, for they are constructing

a formal garden with walled terracing, lily pool and fountain, a lawn with topiary work and herbaceous borders. An ambitious programme!

The Le-Bout-Cas Company are, of course, showing their well known hard tennis court, but, quite apart from this, they are exhibiting a formal garden, the scope of which includes a sunk garden with lily pool and a tea-house. They will also show a grass tennis court with a hedge surround in Yew.

Mr. Ernest Dixon of Putney is laying out his space to represent an ordinary medium-sized suburban garden. His aims are simplicity of planning, with consequent reasonable first cost, and economy of upkeep; this, of course, without sacrificing beauty. Short-lived or difficult plants, however beautiful, are not to be employed, and grass banks and gravel paths, both expensive in upkeep, are being omitted.

Turning now to the informal gardens, which are likely to be more numerous this year than usual, Messrs. R. Tucker and Sons of Oxford will, as usual, erect a rock garden, which will serve to display under suitable conditions a wealth of choice plants, such as *Cypripediums*, *Trilliums*, *Epimediums*, *Lewisiads*, *Iris gracillipes* and *Daphne Cneorum*, with *Broom*s, *Primulas*, *Saxifragas* and what not. Weatherworn limestone is being employed, and the idea is that of a mountain stream emerging from a thicket of Pines. A "moraine"

and miniature alpine meadow are the other features included.

Messrs. W. H. Gaze and Sons of Kingston are also constructing a rock and water garden, but their conception is an entirely different one. A miniature lake and island planted with *Iris*es and Japanese Maples will, with a cascade over the sandstone rock, be prominent features. Every effort is being made to give the whole the effect of an established garden. This firm are also exhibiting their well known "All Weather" hard red tennis court and the new "All Weather" hard green court.

Messrs. Pulham and Son are also employing sandstone for their rocky glen, the stone in this case being Sussex sandstone from the Ardingley district, a bold but highly stratified formation. The banks of the little stream, or rather streams—for there is to be a veritable waters-meet—will be precipitous, and are to be adorned with the usual run of rock-garden plants and choice flowering shrubs. A small pool will receive the streams in the foreground.

Messrs. Carters are preparing a wild water garden with a swiftly running stream and a waterfall down which water is to tumble at the rate of 5,000 gallons an hour. *Iris*es, *Rhododendrons*, *Bamboos* and various water plants will be employed in providing a cool retreat from the heat of the tents.

NEW MAUVE-MAROON COLOURED PERPETUAL CARNATION
ARNOS GROVE.

BRIGHT ROSE PINK BEGONIA HILDA LANGDON.

Messrs. Clarence Elliott, Limited, are staging a rock garden, using water-worn North Country limestone. This is being surrounded on three sides by dry walling of Hornton stone upon which will be placed miniature rock gardens (not Japanese) in stone troughs.

Messrs. William Cutbush and Sons are also staging a small rock garden, displaying some of the more uncommon alpinists.

Flowering trees and shrubs are always a feature of the great Spring Show and on this occasion they will be displayed in considerable variety by Messrs. Cheals. Messrs. Waterer are also staging an exhibit of ornamental shrubs and trees outdoors, while they are putting up a large exhibit of Rhododendrons and Azaleas under canvas. Messrs. R. Wallace and Co. are staging Rhododendrons, Ghent Azaleas and Japanese Maples, while Mr. J. C. Allgrove of Langley, near Slough, is also exhibiting flowering trees and shrubs in great variety. Messrs. Cutbush and Son are shewing topiary.

Border flowers are always shewn in quantity at this Show, Bearded Irises and Lupins being especially prominent. On this occasion Messrs. R. Wallace and Co., who shewed such a superb collection of Irises last year, are concentrating mainly upon hardy Lilies, including such beautiful species as *Lilium regale* and *L.L. Willmottiae*, *excelsum*, *longiflorum*, *umbellatum*, *tenuifolium* (forms of) and the splendid *Sargentiae*.

Perry's Hardy Plant Farm are shewing Bearded Irises extensively, including a number of first-rate new seedlings; many of their herbaceous specialties, including *Coreopsis grandiflora* Perry's variety; *Iris Souv. de Zwauenburg* (*I. lutescens* - *I. Susiana*), a free-flowering early hybrid with standards of silver grey and brown falls flushed with fawn; and *Papaver orientale* Lord Lambourne, a splendid fringed crimson sort. They are also exhibiting a magnificent collection of hardy ferns.

Messrs. Waterer, Sons and Crisp are staging a variety of good herbaceous plants, including numbers of Lupins and Irises, with Pyrethrums, Delphiniums, Aquilegias, Anemuses, etc. Messrs. Cheals are also putting up an all-round exhibit, while Mr. J. C. Allgrove is staging some very interesting hardy plants, including a collection of the wonderful *Erenuri*.

Messrs. Barr and Sons usually make a feature of Darwin and Cottage Tulips at this Show, but this year these flowers will be over before the opening date. Messrs. Barrs will this year, therefore, specialise in Bearded Irises in an exhibit of herbaceous flowers generally. The Chalk Hill Nurseries will have some of their excellent hybrid Candelabra Primulas, mostly of *japonica* or *pulverulenta* parentage, as well as the "Chalk Hill Giant" *Mimulus* for which they are becoming famous. Their excellent strain of fancy Pansies will also be on show and they are using choice varieties of variegated *Funkia* to enliven the whole.

Mr. George R. Downer of Chichester is especially well known for his new herbaceous Lupins, some of them of brilliant colouring. He hopes to make a more than usually attractive display of these on this occasion. Messrs. John Forbes (Hawick), Limited, of Pentstemon tane, will exhibit their almost equally well known Pansies and Violas and a variety of other interesting plants, including the double Scotch Rocket, *Hesperis Matronalis* fl. pl., in both white and purple.

Messrs. Storr and Storr of Glencarse, well known for their special strains of many garden flowers and the tiny braided seedlings they send out, are exhibiting their Auriculas, including the famous "blues and helios," Cowslips, Polyanthus, Primroses and other hardy members of the great *Primula* family.

Messrs. Blackmore and Langdon will have their splendid Delphiniums, including such as Mrs. Townley Parker, Blue Queen, Mrs. Shirley, Mrs. C. Melver, Col. Sir Wyndham Murray and Millicent Blackmore. Pyrethrums and Lupinus Sunshine will be outstanding features in Messrs. Bakers' herbaceous group.

There will, as usual be quantities of alpinists on show in the tents. Among others who have taken space for these mountain jewels may be mentioned Messrs. Carter Page and Co., Bowell and Skarratt, Ernest Dixon, Perry's Hardy Plant Farm, Prichard and Co. (West Moors), Clarence Elliott, Cheal, Cutbush, Bakers Limited, W. H. Rogers and Son, Limited, and F. G. Wood. The last named informs us that he will be shewing some good seedlings of the Grecian Violet, *Viola gracilis* in various colourings.

Perpetual Carnations will, as usual, be largely exhibited by such firms as Allwood and Co., C. Engelmann, and Stuart Low and Co. Mr. Engelmann expects to make an especially fine display. Among his most prominent novelties will be Orange Sunstar, Cream Saffron and Goliath; while Messrs. Stuart Low and Co. believe that they are challenging the supremacy of Enchantress Supreme at this Show with Hon. Nita Weir. Other outstanding varieties are Arnos Grove (a splendid new heliotrope), Lady Elizabeth Bowes-Lyon (an improvement on Iona), Eileen Low (the salmon which proved so attractive last year) and the scarlet Lord Lambourne. Messrs. Wm. Cutbush and Son are shewing among

others the beautiful clear flesh pink Renown. The same firm is exhibiting in the Border section a new variety called Prince of Wales. The colouring of this is unusual—a shade of mauve maroon, and it is a sport from the well-known King Arthur. The Show would hardly be Chelsea without Mr. James Douglas's Carnations. Every year the list of Douglas Cloves on show gets longer, and this year promises to be no exception.

The season is backward, but Mr. Herbert hopes to have his splendid perpetual-flowering Pinks as usual and, though he would probably not admit it, is quite likely to "hit" some more awards of merit. A fine display of Allwood's, too, may be confidently expected.

Roses are always one of the great attractions at Chelsea and a good show is assured this season. Mr. Elsha Hicks will exhibit Roses in pots and also cut blooms, including, among many others, Mme. Butterfly, Hoosier Beauty, Elsie Beckwith, Mrs. H. Winnett, Evelyn, David Lloyd George and several new seedling climbers.

In the group staged by Messrs. Frank Cant and Co., there will be many good new seedlings of their own raising, such as Capt. E. S. Harvey Cant,

Rosabel Walker, Prince Yagala, Henry Noyard (the dark crimson Rose which won the Clay Cup for fragrance), and Mrs. Alfred West. Many fine climbers and older dwarf varieties will also be shewn. Messrs. William Cutbush and Son will, as usual, stage a number of the exceedingly useful dwarf Polyantha varieties, while Messrs. Benjamin R. Cant and Sons will stage, in a comprehensive group, all their novelties first sent out this season or last, such as Lady Roundway, Lady Dixon-Hartland, Phoebe, Rev. F. Page Roberts, Sovereign, Mrs. Oakley Fisher, Constance Casson, Padre,

PAPAVER ORIENTALE LORD LAMBOURNE, BRIGHT CRIMSON SCARLET.

Esmé and Golden Ophelia. Messrs. Waterer, Sons and Crisp also expect to have a representative collection from their Twyford Nurseries.

Dahlias will probably be shewn fairly extensively by Messrs. J. Cheal and Sons, including many of their elegant Star varieties and by Messrs. Carter Page and Co. Messrs. John Forbes (Hawick), Limited, are staging the splendid dwarf bedder, Coltness Gem.

Sweet Peas will be exhibited by Messrs. Dobbie and Co. and Messrs. Ireland and Hitchcock. Messrs. Dobbie's outstanding novelty will be Mary Rose, which is self rose pink in colour and quite distinct. Royal Sovereign, said to be the largest and strongest-growing deep orange variety is another. Messrs. Ireland and Hitchcock are "starring" their novelty Lord Lascelles, which they claim to be the best lavender Sweet Pea yet offered. This firm are also shewing Mascott's Dianthus, the salmon pink fragrant mule between Carnation and Sweet William, which received an award of merit last summer. Other annuals will be there in strength. Messrs. Sutton and Sons are setting up a veritable garden of growing annuals—quite a new feature—with paths of velvet sward.

Messrs. Webb of Stourbridge are also shewing annuals extensively, including the beautiful everlasting *Rhodanthus*, *Linarias*, *Linums*, *Nemesias*,

will have their mouth-watering Strawberries in such varieties as *Maréchal Foch*, *The Duke*, *Laxton's Abundance* and *Laxton's Omega*, the

BASKET BEGONIA EUNICE; SOFT PINK, FLUSHED PEACH.

Stocks, *Dimorphotheca*, etc., all of the finest possible strains. Messrs. Carters are staging *Clarkia Brilliant Princess* and *Petunia Queen of Roses*, with masses of Sweet Peas in their exhibit of florists' flowers.

Messrs. Dobbie and Co. are making a special feature of *Antirrhinums*, including several new varieties now staged for the first time. The popular intermediate varieties are represented in a wide range of colouring from pure white to deepest crimson, and there is a good selection of the exceedingly valuable tall varieties.

Coming now to the general run of greenhouse plants, there will, of course, be a wide variety on view. Messrs. Blackmore and Langdon will have, as usual, a magnificent exhibit of double *Begonias*, including such splendid sorts as *Hilda Langdon*, *Lord Lambourne*, *Mrs. H. Bedford*, *Mrs. H. Moncrieff*, *Peace*, *J. W. Pyman* and *Mrs. T. Crawford*. The first three named are this season's novelties. Their basket *Begonias* will probably include the splendid pink *Eunice*.

Messrs. Stuart Low and Co. will have an interesting collection of Australian and New Zealand plants, including *Acacias* (*Mimosas*), *Borouias*, *Eriostemons*, *Chorizemas*, *Leptospermums* and *Metrosideros*, together with *Heaths*. All these are suitable for the cool greenhouse.

Messrs. Carters will stage *Cineraria stellata* and the Cactus-flowered forms, as well as their prize strain, also *Gloxinas*, *Calceolarias*, *Schizanthus*, etc.

Messrs. Webb and Sons of Stourbridge are exhibiting their well known strains of *Cineraria*, *Calceolaria*, *Gloxinia*, tuberous-rooted *Begonia* and *Primula obconica*. Messrs. W. Cutbush and Sons are shewing a collection of choice *Hydrangeas*.

Mr. James MacDonald of Harpenden, who last year annexed a gold medal for his wonderful garden of hardy Grasses, is making another remarkable effort on this occasion.

Fruit seems hardly likely to be shewn so extensively this season as usual, but Messrs. Laxton's

latter said to be the latest variety in existence and this season's novelty.

Messrs. George Bunyard and Son will, as usual, exhibit a remarkable collection of Kent-grown Apples.

PROBLEMS OF GARDENING

THERE are invariably awkward corners in a garden that tend to throw out of gear our most carefully devised schemes of arrangement. It is an easy matter with the aid of a book or two and a good seedman's catalogue to choose the plants that shall occupy the principal beds upon the lawn, or to work out a pleasing colour scheme and seasonal display in the herbaceous border, but difficulty confronts us when we contemplate such spot as a steep bank, overhanging, perhaps, with trees and shrubs, where, despite the fact that the sun never reaches it, the soil is not the cool, moist bed so favourable for the cultivation of *Primulas*, *Spiræas* or *Violas*, but is just a dry, barren waste of hungry soil, impoverished by the network of tree roots, where even the summer rains are denied access by reason of the canopy of foliage overhead.

To permit such a bank to remain unadorned is to mar the whole effect of the rest of the garden, but, happily, there are plants that may be induced to thrive and clothe the awkward corners with attractive foliage and cheery blossoms. The *Rose of Sharon*, botanically named *Hypericum calycinum*, and various other members of the same family are admirably adapted for such a purpose as that indicated. Producing graceful spreading branches clothed with oval leaves, arranged with precise regularity in pairs, each stem terminating in a cluster of blossoms shaped somewhat like a single *Rose*, the *Rose of Sharon* is a really striking plant. The petals are of rich yellow and in the

centre of each blossom stands prominently out a cluster of slender, pin-like stamens, the heads of which are brilliant red. Another very useful dry bank plant is *Achillea millefolium* "*Cerise Queen*." It is but a garden variety of the native *Yarrow*, but its finely cut foliage and its large flat umbels of bright cerise flowers, place it among our most serviceable perennials. As a cut flower it is very decorative, and the more the flowers are cut the greater will be the quantity produced, the display extending from early June to late autumn.

Where a plant of considerable height is desirable for screening the bareness of the lower branches of old shrubs, *Epilobium angustifolium* in both its rosy purple and pure white forms will meet the need. The plant varies in height according to soil and situation, but may be said to range from 4ft. to 6ft. The flower spikes are produced during July and August.

This plant is a difficult one to control. It spreads very rapidly by underground stolons and, if allowed to seed, it will colonise far afield. It should, therefore, be used with care.—ED.]

The problem of furnishing a hot dry bank exposed to the scorching rays of the sun is perhaps less difficult than the foregoing, but we frequently see unsuitable plants struggling for existence, whereas a more judicious selection would ensure happy results. A wonderful plant is the *Gazania*, capable of withstanding a parching drought and scorching heat. The foliage is long and narrow, borne in tufts on prostrate stems. The upper surface of the leaf is green, of a glossy hue, the underside almost white, while some have a narrow yellow margin to the leaves. The flowers are shaped like a *Daisy*, but very large, frequently measuring 4ins. across. The petals are of rich glowing orange colour and, around the disc, or central cushion is a velvety black ring, relieved at regular intervals by round dots of pure white. There is something extremely uncommon and startlingly beautiful about the blossom of a *Gazania*, and it is strange that so lovely and so useful a plant for dry positions is not more frequently grown.

Several species of *Fig Marigold*, those brilliant red and rose coloured succulent plants that labour under the appalling name *Mesembryanthemum*, although natives of South Africa, have proved hardy enough to withstand our British winters if established in the driest and hottest corners of the garden, where their stems may become thoroughly hardened and ripened before winter sets in. Even the tenderest species will flourish and bloom profusely throughout the summer, and they are so gorgeous that they well deserve some slight protection during winter. Their foliage is thick and fleshy, after the style of a *Cactus*, and it is by storing up ample supplies of moisture in the cells of the leaves that the plant is enabled to withstand prolonged drought and scorching heat. The blossoms open flat and the petals are of vivid colours, intensified by a glistening sheen that gives them almost an appearance of satin.

We have also the *Valerian*, *Centranthus ruber*, and its varieties in scarlet, rosy pink and white which will grow even in stony gravel or where chalk lies within a few inches of the surface. Young plants may be transferred from pots to their flowering quarters during the month of April, but perhaps the most satisfactory method of establishing a colony of *Centranthus* is to scatter seeds thinly over the soil and allow the plants to grow undisturbed. The only necessity is to exercise patience until the second year, as the seedlings rarely flower the same season as sown.

Given a little trouble, there is really no reason why any part of the garden should be an eyesore.
L. I. ATRIS.

WATER AND BOG GARDENING—VI

(Concluded from page 234.)

SOME of the smaller Day Lilies are magnificent, and in these we have a combination of bright lily-like flowers and gracefully arching foliage that looks especially well in association with water. Then, too, there are the brilliant perennial Lobelias, *L. syphilitica*, with green leaves and vivid royal blue flowers, and *L. fulgens*, even more striking, with intense crimson red flowers on long spikes and coppery red stems and foliage. There are very beautiful rosy forms of this species, too. That beautiful Water Forget-me-not, *Myosotis palustris semperflorens*, will grow—and flower amazingly, too—anywhere where it is constantly moist, straying from the bank into the water and from the water to the bank again. *Parnassia palustris*, the Grass of Parnassus (though why "grass" is difficult to imagine), is a plant to mass in quantity where its beautiful effect will tell in late summer, when it covers itself with masses of white green-veined flowers something like large single Anemones.

Hardy Primulas in such lovely species as *rosea*, *pulverulenta*, *Bulleyana*, *sikkimensis* and *japonica* are at their happiest in the neighbourhood of water and put into the shadow all those grown under other conditions. Their leaves are larger and more vigorous, while their flower-stems rise upwards into immense heads or tier above tier, shewing a marked appreciation of the coolness and moisture that surround them. *Ranunculus gramineus*, with its grass-like foliage and foot-tall specimens from April to June, is a grand bog plant and bears its fine yellow flowers generously too. Yet another of the family, *R. parnassifolius*, with its dark green woolly-edged foliage and large pure white flowers, does well and is suitable to the small garden, as it does not exceed nine in height. A most striking and unusual Saxifrage that does magnificently by the waterside is *peltata*, with large bronzy green shield-shaped leaves on stems 2 ft. high and with spikes of whitish flower in spring. It does not always attain this height, however, and if you plant it a little further from the waterside, frequently does not exceed half. With a charm that is all its own *Spigelia marilandica* forms a delightful little specimen, about 1 ft. tall, with narrow green leaves and quantities of coral red flowers that are each tipped with yellow.

Now let us turn to the large water garden where one has not to consider restriction of size. Here, indeed, we find no shortage of suitable material, for Bamboos, giant Grasses, Irises, Polygonums, Phormiums, etc., clamour so loudly for admission that it is difficult to detect one voice above the others. In addition to *Gunnera manicata*, there are two very bold and imposing Rheums—*R. emodi*, with broad ovate foliage, and *R. palmatum*, with deeply incised cordate leaves, both bearing tall heads of white flower, rising to a height of from 6 ft. to 10 ft., according to the richness of the soil. *Acorns gramineus* fol. var., the handsome variegated Sweet Flag, will grow upon the margin or just in the water with equal impartiality. The noble Arundos, among the finest of all Grasses, must be kept well away from the margin, for they do not like too much moisture, and if the variety *Arundo Donax* fol. var. is chosen, it should receive a little protection in winter. Astilbes are glorious, one of the finest of all being *Davidii*, which reaches a height of 4 ft. and smothered itself in September with masses of its purplish plumes.

As regards Bamboos, with ample space glorious effects can be achieved with such giants as *Arundinaria anceps*, 8 ft.; *Bambusa nana*, 5 ft. to

10 ft.; *B. quadrangularis*, 10 ft. to 15 ft.; *Phyllostachys aurea*, 5 ft. to 20 ft.; *P. flexuosa*, 10 ft.; *P. Henonis*, 20 ft.; etc. Among the giants we must name *Heracleum giganteum*, with its immense leaves and towering stems 8 ft. to 10 ft. tall, with a huge head of white flowers as large as a cart-wheel, where moisture is abundant and the soil rich. It makes a splendid island plant, for it is when separated from it by a sheet of water that one gets it in sufficient perspective to appreciate to the full its noble dimensions. Of course, the wonderful Japanese Kämpferi Irises, blooming as they do in June and July, will be generously represented on the banks, for it is here that they produce those giant richly coloured flowers that "count" so much in the colour picture. Speaking of Irises reminds me of another capital thing, *I. sibirica*, with its long grass-like foliage and wonderfully reticulated blue flowers. The lovely golden striped Rush, *Juncus effusus aurea striata*,

than *Rodgersia podophylla*, for it has a character all its own in the large leaves on their long stalks 2 ft. to 3 ft. high, which assume a splendid coppery hue with age. I can never pass the quaint Porcupine Quill Rush, *Scirpus Tabernaemontani zebrinus*, without a second look, for it is so very distinct and unusual. It forms a tuft of leaves 3 ft. to 4 ft. high, very pale green in colour, and alternately barred in green and white. All the Spiraeas are superb and form magnificent plumes of feathery inflorescence where moisture is abundant, and generous use should be made of them wherever it is possible to mass to the best effect.

In conclusion, I would complete with a word of high praise for the Senecios. These are gorgeous in late summer and in masses stand out conspicuously right across a big sheet of water with their great heads of vivid orange flower that have, owing to their intensity, a great reflection value when mirrored upon the placid surface beneath them.

And so we come to the end of a great subject, full of pictorial possibilities, whether looked at from the point of view of the small garden pond or as

THE FRAGRANT CAPE HAWTHORN, APONOGETON DISTACHYON.

a very useful plant with variegated foliage and panicles of flower just beneath the tips, should not be omitted.

The autumn effect of the American *Jussiaea grandiflora* is good enough to admit it without the beautiful light yellow flowers which appear in summer and are reminiscent of the Evening Primrose. As the days shorten and Nature reaches her climax, the long willowy leaves become a deeper and deeper crimson, until the whole plant presents a most gorgeous appearance. The handsome sword-like leaves of *Phormium tenax* are well known and always attractive, and although it may be planted and live elsewhere, you will find that by the waterside it gives of its very best. From the Himalayas comes *Podophyllum emodi*, with its handsome pale green leaves marbled with bronze and, in July and August, large white flowers 1½ ins. across that are followed by bright coral red fruits; while as a companion to it *P. peltatum*, with lobed leaves and large waxy white flowers, followed by yellow fruits, is excellent. A tall grower—8 ft. high—is to hand in the superb *Polygonum Sieboldi*, with its heart-shaped leaves and racemes of white flower. To fill a somewhat shaded moist spot you will scarcely do better

a natural lake. A picture of cohesion and unity, a picture that begins upon the water's surface and does not end until, imperceptibly, we have traversed the marshland and bog to the moisture lovers and stand again upon ordinary "dry ground."

H. W. CANNING-WRIGHT.

THE CAPE HAWTHORN

THAT remarkable water plant *Aponogeton distachyon* always attracts the attention of those not well acquainted with aquatic plants, and they are always a little surprised when told that the English name is Cape Hawthorn. Why Hawthorn? is the invariable query, and, indeed, it does appear inapposite, even when one has gathered the curious forked inflorescence, and has noted the powerful fragrance so like that of an English hedgerow when the "May" is in bloom. This plant is a great deal harder than many writers have suggested. It should not be planted, however, in water so shallow that it is likely to freeze solid in winter. Once well established it reproduces itself so freely from self-sown seed that a big stock is soon developed.

CORRESPONDENCE

NARCISSUS BEERSHEBA.

THE REV. JOSEPH JACOB, in his notes on flowers at the Midland Daffodil Show, is mistaken in stating that I am the raiser of this wonderful flower. I should be very pleased and proud if I had been its raiser, but the honour must be credited to our great master artist, Mr. Engleheart, in whose footsteps we other Daffodil raisers follow at a very respectful distance indeed. In Beersheba he has given us a flower that marks, if not the only advance, certainly much the greatest advance in white trumpets since he brought that perfect flower White Emperor up to the R.H.S. Daffodil Show in 1913. Ever since I first saw Beersheba in 1920 it has compelled my unqualified admiration and homage. I have grown it here for the first time this season, and can only say that it is the Daffodil of my dreams! I understand that it was raised from White Knight by pollen of one of Mr. Engleheart's own best white trumpets; it carries the character of the lovely White Knight into a very large flower. It would be difficult to exaggerate the beauty of its great perianth, which is perfectly modelled and beautifully clean cut like that of White Knight, and stands quite flat and at right angles to the graceful slender trumpet from the time the flower first opens till it dies, which is a very long time, as it is extraordinarily lasting. It is considerably whiter than White Knight and not so drooping, but has a most stately and imposing carriage, being mounted on a really tall stem. In addition to its arresting beauty it has the virtue of a most vigorous constitution, with

quite exceptional rapidity of increase, and it is early. Taken all round, I think it is one of Mr. Engleheart's most outstanding achievements. An illustration of this variety, which really was rather a libel, was published in *THE GARDEN* a few weeks ago. I therefore send another photograph for publication herewith, which, though not a flattering likeness, does convey a somewhat better idea of the flower. The bloom of which Mr. Jacob wrote, which is, in fact, the one illustrated herewith, had been out for over three weeks when it was shown and photographed, and had to go through the ordeal of a thorough and careful washing with warm water and "Lux" to remove as much as possible of the staining of a very sooty rainfall! so it had lost some of its white-

A FINE SPECIMEN OF A BEAUTIFUL CHERRY, *CERASUS LANNESIANA* VAR. *BOTANZAKURA*.

THE BLOOM OF NARCISSUS BEERSHEBA SHOWN AT BIRMINGHAM

ness and beauty of texture, and was really considerably past its best when shown. I think that Mr. Jacob has inadvertently exaggerated its size a little bit, but I did measure blooms this season in Mr. J. S. Arkwright's garden, and at Brodie Castle, N.B., which were fully sun, across and of much better quality than the flower I showed, which was grown from a bulb first year down.—GUY L. WILSON, *Broughshane, Co. Antrim*.

The photograph of Beersheba which was reproduced in our issue of April 28 was a very good one, but, unfortunately, it suffered considerably in reproduction. May Mr. Wilson's picture have a better fate!—*Ed.*

CHERRY STOCKS.

THE condemnation of English stocks for the Japanese-flowering cherries appears to have originated with Mr. Wilson. So far as *P. Avium* is concerned, for

the large-growing forms of what he calls *P. Lannesiana* and *P. serrulata*, this stock appears to be admirably suited, and certainly better for this country than the dwarfing stock commonly used in the Japanese nurseries. I have imported seeds, seedlings and grafted plants from the Orient, and have now no hesitation in using *P. Avium* in preference to the plants employed by the Japanese themselves. Mr. Wilson admits that the stock they commonly use—which he calls *Mazakura*—is unsatisfactory, and recommends *P. serrulata sachalinensis*—in itself a beautiful and very desirable tree.

But where can one get this stock? So far I have failed to get either seeds or seedlings of this vigorous northern form from Japan—only a narrow-leaved, weak-growing tree, obviously unsuited. As a proof that *P. Lannesiana* flourishes on *Avium* I enclose a photograph of the double-flowered variety *Botanzakura* (I believe it to be this form, but the nomenclature of these cherries is still in a hopelessly chaotic condition). This tree is about 3 ft. through, and Mr. Wilson says that even in Japan such dimensions for a double-flowered variety are of rare occurrence.

With regard to the early-flowering subhirtella group (of which I possess five varieties), I am entirely in agreement with Mr. Wilson as to the unsuitability of *P. Avium* as stock. They should all be worked on the wild form named by that writer, *P. subhirtella ascendens*. In your Editorial of May 3 mention is made of the so-called Apricot-Plum, *P. dasycarpa*. As I am anxious to obtain an example of this tree, I would be grateful if any reader who has a plant to dispose of would communicate with me.—COLLINGWOOD INGRAM, *The Terrace, Remden*.

A CURIOUS PHENOMENON

THERE was a curious arrest of development last autumn in the fruit of *Cornus capitata*. The fruit did not ripen in the usual way in the autumn, but remained at half size until the sap moved in March; it then again began to grow, ripening in April. I mention it as it was common to this plant in many gardens both in Cornwall and Devon.—P. D. WILLIAMS, *Cornwall*.

ANDROSACE LONGIFOLIA?

I SEND a photograph of an exquisite *Androsace* which I obtained from the late Reginald Farrer under the name of *Androsace longifolia*. It is now (April 11) in full flower. It has done so well with me and stood many degrees of frost, that if it is the true plant, as I believe it must be, I think Mr. Farrer was mistaken in stating that it is not hardy. It is a beautiful thing, with dark green foliage and pink buds, followed by pure white flowers, and seems to have an excellent constitution. I have taken considerable trouble to find out where elsewhere in Britain this plant is grown, so far without success. I shall be glad to hear from anyone who has the true plant. Mr. Farrer was away in China at the time I received it, and it is just possible his gardener may have sent me the wrong plant. He certainly sent me a rare gem, and one that has proved quite hardy.—J. FARNWORTH ANDERSON, *Glenn Hall, Leicester*.

A DESIRABLE MAGNOLIA.

MAGNOLIA LENNEI is a very desirable flowering tree for a small garden. It is slow in growth—never making a large tree, and every May flowers freely with showy blossoms. The specimen of which I enclose photograph was planted about fifteen years ago. It has proved quite hardy, and for years has flowered regularly. This year it bore over seventy blooms, and was a conspicuous and beautiful object till the hurricane and bitter frost of the night of May 9 destroyed its beauty. *M. Lennei* is a hybrid Magnolia. The parents, I believe, are *conspicua*, the Chinese Yulan or Lily Tree, and *M. obovata*, a variety with rather small flowers of a purple colour, so that it is an improvement on both its parents, the flower being some 5 ins. to 6 ins. across, globular in form. The outside of the petals is a reddish purple, the interior a beautiful white, and when fully expanded it is a lovely flower.—J. P., *Glos.*

TWO FLOWERING PLANTS IN ONE POT AT ONCE.

BEING about to stand outside our pots of *Arums* after their season of flowering, it occurred to me it might be worth recording how well *Primula malacoides* has done, growing and flowering in the same pots as the Lilies. I readily grant it was not the best gardening to leave the two crops in one pot, but the seedling *Primulas* came up so naturally and evenly that I decided to chance the result, which has been quite good.

A PAN OF ANDROSACE LONGIFOLIA?

There are about twenty pots, and their association came about through the *Callas* being stood last season near to some *Primula* plants ripening their seed, though I was quite unaware they had sowed themselves until the youngsters came up. The *Primulas* began to shew signs of decay a short time ago owing, of course, to having to put up with more moisture than they want; but, on the other hand, they commenced to bloom before the *Arums* and continued to do so practically throughout the season of the latter. Incidentally, the happening shows how easily seedlings of this *Primula* can be obtained.—C. T.

A SHRUB FOR SEASIDE GARDENS.

IN order to achieve really satisfactory results from any garden it is quite essential that the natural environment of the place shall be duly

A FIFTEEN YEARS PLANTED MAGNOLIA LENNEI.

considered. The term "seaside garden" has been adopted and means a garden where the prevailing conditions are those of the sea coast. This does not mean a garden in connexion with a sea coast, but a garden where the prevailing conditions are those of the sea coast. They are exposed to the sea wind, or where the air is so dry that the air is so dry that the spray of the billows which dash against the rugged cliffs by the shore. Happily, however, there are plants, and highly ornamental plants too, which not only are capable of resisting evil effects, but really appear to delight in the conditions that prevail in the vicinity of the seacoast, and such plants are of distinct value to a proportion of gardens in our seagirt isle. *Atriplex Halimifolia*, Tree Purslane, is a shrubby, almost evergreen plant that is eminently useful for the

seacoast garden, for it is a tree-growing plant that will form a bush of considerable size, and is decorative almost the year round. In common with most maritime plants, its stems and foliage are coated over with a greyish tomentum or, to use the technical term, they are glaucous, and this silvery grey tint is the chief attraction in the plant. The flowers are purple, rather small and in comparison with the foliage are inconspicuous, but where beautiful foliage exists showy flowers are not greatly missed. In order to give the plant the best of chances it is well to plant comparatively small, young stuff, for such are able to firmly establish themselves before the herbage is greatly affected by the wind, and when once well rooted sturdy growth will be made that can abide the storm. Sandy soil suits either cuttings or rooted plants, and the former made of well ripened wood root readily under a handlight.—A. J. MACLELL.

A BEAUTIFUL GREENHOUSE PLANT.

ERANTHEMUM ANDERSONI is not uncommon in English gardens as a warm house plant. A description of its habitat in the Central African forests may suggest to gardeners treatment which will suit it under cultivation.

It is essentially a forest plant, only to be found in the densest shade and where moisture is most abundant. Should there be any break in the canopy overhead, no *E. Andersoni* will be found where the sun strikes. In such positions the temperature is relatively low. Entering such a forest from the hot sunny grassland, one feels as great a change as is felt on leaving the stovehouse at Kew for the Cape house.—L. BROWN.

FORTHCOMING EVENTS.

May 29.—Royal Horticultural Society's Great Spring Show at Chelsea (three days).

May 30. Annual General Meeting of the Kew Guild, to be held at the Imperial Hotel, Russell Square, W.C.1, at 6.30 p.m. Annual Dinner to follow the general meeting at 7.15 p.m.

FRAGRANT FOLIAGE—II

I DO not remember ever to have seen explained on physiological grounds the noticeable fact that such a preponderant proportion of fragrant foliage belongs to that order of plants which botanists call "labiate," that is, to plants whose blossoms have a "lip," such as the Mints and the Lavenders. At the same time it must be allowed that this interesting family has the defects of its virtues, for if many of the race smell sweet, there are others that smell unpleasantly rank, one member of the family, the Wood Woundwort (*Stachys sylvatica*) being probably the most malodorous of our native weeds. If one tries to remember plants of families, other than the labiates, with specially fragrant leaves, it is surprising how few there are among the plants in general cultivation. The Umbellifers include a number of species with foliage more or less aromatic, but I can think of only one that is likely to be grown for its perfume—the lacy-leaved Sweet Cicely (*Myrrhis odorata*), a plant from which I sometimes find myself pinching the fragrance as I pass, not so much for any delight in its sweetness as for the associations that mingle with its somewhat drug-suggestive odour. The Tansies and Artemisias are Composites, and the Aloysia or Lippia, most fragrant of fragrant shrubs, is a Verbenaceae. Of the Tansies, not a numerous family, the most desirable for its perfume is the old-fashioned sweet herb of cottage gardens, Costmary or Alecost (*Tanacetum Balsamita*). To some the alternative English names of this plant may be a little puzzling, but they are intelligible enough if one remembers that "cost," the syllable common to both names, is Greek for "aromatic plant," so that in the remote past, apparently, the herb was by some dedicated to the Virgin and by others used as a substitute for hops. Anyhow, though its fragrance is perhaps more robust than delicate, the Costmary is a pleasant thing to have in the garden, where nowadays, however, it is not too often seen. The Sweet-scented Verbena, unfortunately, cannot be counted among our hardy shrubs. Still, it is perhaps harder than many people believe it to be, so that it is always worth while to try it in any English garden where some little protection is available from wall or tree. A thick covering of dry leaves also is a simple form of protection that might be tried for this tender plant with some assurance of carrying it through the winter. The only Artemisia I grow is Lad's Love (*A. Abrotanum*), though I believe there are others worth growing for their fragrance. But Lad's Love is a host in itself, not merely for its perfume, but also for the beauty of its finely divided foliage. If this accommodating shrub is cut back hard in winter or spring, its leafy young branches, untouched through the summer by blight or grub, provide a supply of foliage as beautiful as it is fragrant.

Of the numerous and fragrant family of the Labiates, the most treasured and the most frequently grown in gardens are, beyond question, the two evergreen shrubs Lavender and Rosemary, which have not only their beauty and fragrance to recommend them, but also centuries of pleasant association. Happy the garden that has its old trees of Rosemary and Lavender, for age adds picturesqueness to their beauty and sweetness. In small gardens such trees supply that touch of the lasting and the venerable which we all desire and which, in extensive grounds and gardens, is supplied by more imposing things, for a Lavender well up in years may look as twisted and as grey as an old Oak or Apple tree. There is quite a number of Lavenders, though I cannot

say that among them there is much variety to speak of, either in appearance or in fragrance. I grow some five or six varieties in my own garden. Being there, there they are; but, apart from the spirit of curiosity and the passion for collecting which are ingrained in many gardeners, I think three varieties are sufficient for any reasonable garden, and these three should be in every garden—the common tall Lavender (*Lavandula Spica*), commonly called "English Lavender," the white variety of *L. Spica*, and a neat miniature Lavender, smaller in all its parts than the English Lavender, and variously named according to its supposed place of origin. I would add a fourth—a Lavender

A FRAGRANT MAT OF THYMUS SERPYLLUM LANUGINOSUS.

with serrated leaves, the specific name of which I have forgotten (*dentata*?)—but unfortunately it is not hardy, in my garden at least.

In Rosemarys there is not much choice, though I believe a certain range of colour, from pale lilac to purple, may be found in the common plant that we all grow. I have read, in old writers, of various Rosemarys—some broad-leaved, others narrow-leaved, some streaked with gold, others with silver—but if such varieties exist I have never seen them in cultivation. The only Rosemarys known to me at first hand are the common sort (*Rosmarinus officinalis*) and a prostrate miniature form (*R. prostratus*), which is probably a garden variant of *R. officinalis*. The prostrate Rosemary would be an ideal plant for a ledge of

rockwork, but unfortunately it is somewhat tender, and available therefore only for specially favoured localities, though, for the matter of that, the common bush Rosemary is none too hardy, thriving in some gardens only if planted on a dry, sunny bank or under the protection of a wall.

I suppose the various Thymes, even the diminutive forms, are shrubs and not herbaceous plants, inasmuch as though they extend their branches annually, these are not renewed from the root-stock upward. But the most shrubby are never more than shrublets. The tallest Thyme known to me, some 18 ins. or 2 ft. in height, is a native of Greece, and forms the scrub no doubt of many Greek hills, but very specially of Mt. Hymettus, whence the bees of Athens bring the honey which has become a proverb for its incomparable flavour.

I have myself pleasant memories of the shrub and of the honey, and should be glad if any reader of THE GARDEN could inform me of the name of this species and where in this country it may be procured. The Thymes are desirable garden plants, all of them having the characteristic aromatic sweetness, and none of them being difficult either to grow or to keep within reasonable bounds. The common Garden Thyme (*T. vulgaris*), usually relegated to the herb plot, is quite a handsome plant when it is well grown and covered with bloom. (I wonder whether the Greek plant is, after all, only *T. vulgaris*?) The various Lemon Thymes, plain or coloured, are everybody's favourites, though I do not find in their scent much suggestion of lemon. *T. micans* (identical with *azoricus*?) forms a pretty evergreen pad or cushion several inches in height. Those who desire for their rock gardens a neat mat with a woolly pile will, of course, grow *T. lanuginosus*. A desirable but little-known Thyme is *T. carnosus*, a fragrant shrub of fastigate habit which grows about 1 ft. in height and in its compact shape

mimics an Irish Yew or Lombardy Poplar. A curious, charming and, I fancy, uncommon Thyme with an odd name is *Herba-barona*, hailing, I think, from Mediterranean regions and therefore in all probability not too hardy. This pretty plant in its manner of growth resembles our native Thyme, the long, plant branchlets lying close to any available surface, soil or stone, horizontal or vertical. What its bloom is like I cannot say, my *Herba* not having so far flowered; but its bloom is of secondary interest—the important characteristic of *Herba-barona* being its strong caraway fragrance, so that children like to stroke it and think of seed cake. I have not, so far, seen the inflorescence of *Herba-barona*, and should not be surprised to learn that botanists classify it elsewhere than with the Thymes.

NOW is the time to make enquiries for Autumn Planting of

MERRYWEATHER'S FRUIT TREES

THE DAMSON

FOR PROFIT IS THE

"MERRYWEATHER."

DAMSON - MERRYWEATHER. — (F.C.C., R.H.S., 1913). This has caused quite a revolution in Damson growing, the growth is very similar, and as vigorous as Victoria Plum. Unlike all other Damsons it commences to fruit as soon as the tree is two or three years old. The fruit is the most wonderful feature, on account of its enormous size. They could readily be mistaken for a late Plum, until tasted, when, although the size is so much above that of the largest Damson grown, the true flavour of the Damson is retained. We believe there is a large future for this introduction, and, like Bramley's Seedling amongst the Apples and Victoria amongst the Plums, must be in every orchard or fruit garden in the country.

PRICE :

Maidens, 2 6 each. Bushes and Pyramids, 3/-, 4/-, and 5/- each. Half Standards, 4/-, 5/- and 7 6 each. Standards, 5 6, 6/-, 7/- and 10 6 each. Dwarf Fan Trained, 6/-, 7 6 and 10 6 each. Espalier Horizontal Trained, 3 tiers, 7 6, 4 and 5 tiers, 10 6 each. Single Cordons, upright, 3 6, 5/- and 7 6 each, an ideal Cordon fruit.

Fruit growers should not miss planting

CURRENT SOUTHWELL RED

It flowers very late, and so escapes late frosts. Long bunches of bright shining red berries are formed, the individual berries being very large and uniform in size. When gathered it has a very fine appearance and commands the top price in the market.

Price 8d. each; 7/- per doz. Extra strong, 1/- each; 10/- per doz.

THE 'HOME GARDEN' BOOKS

No. 5

ALPINE PLANTS

By A. J. MACSELF

Author of 'The Alpine Garden',
 'The Alpine Garden', &c.

Illustrated with 8 beautiful coloured plates
 and a fine series of black and white drawings

This thoroughly practical work brings Alpine Plants within the reach of all. Even a rockery is shown to be not indispensable. This consideration for the busy flower-lover of limited means constitutes the book's great attraction, and its clear directions will be read and followed with enthusiasm. The author has spared no pains to make his work both lucid and comprehensive. Propagation is fully dealt with, and lists are added, classifying plants under such headings as their effectiveness in winter and their requirements in the matter of sun, shade, moisture, &c. 'ALPINE PLANTS' affords help for both the expert and the beginner.

For one virtue or another all the Thymes are worth growing if one has room for them. But, after all, choice as are some of the exotic Thymes, one's first affection is for the wild plant that gems the countryside. Its neatness, its sweetness and its quiet beauty make our native Thyme, common though it is on heaths and waste places, welcome also in the garden, where it has sported into a variety of shades, ranging from white through pink to carmine.

Nevertheless, I cannot think it is in the garden that our native *Serpyllum* appears to best advantage. To see the wild Thyme in all its exquisite charm one must go to an upland pasture close-cropped by sheep and ridged with immemorial anthills, where it disputes the turf with Bird Trefoil and the yellow Sun Rose. And there the best way to enjoy its sweetness is to lie prostrate upon it or, if one's habit is suitably cylindrical, even to roll upon it. SOMERS.

CULTIVATION OF MELONS IN FRAMES

[In Answer to a Correspondent.]

IF careful attention be given to the plants throughout their season of growth there need not be any failure in securing a good average crop of fruits in frames. Undoubtedly, the gentle heat from a well made hot-bed helps very considerably in their successful cultivation. The cultivator must make up his mind to look well to every detail in connexion with the work, otherwise it would be much better to devote his efforts to other kinds of plants, as the Melon plant is easily killed through inattention to ventilation, watering, feeding and training.

THE HOT-BED: HOW AND WHERE TO BUILD IT.—If there is a naturally formed shelter against north and east winds, make up the bed in that quarter. Where there is no natural shelter make a temporary one by fixing hurdles or have a semi-circular row of Runner Beans about 6ft. from the frame. The position should be a dry one, too. Litter fresh from stables and tree leaves collected last autumn in about equal proportions form the best hot-beds, as the heat is never excessive and it is lasting. In brick frames or pits the hot-bed must be made up inside. Where movable frames are used the bed should be 18ins. wider each way than the frame itself. Mix the leaves and litter together, then lightly shake the material on the allotted space in layers, thus building up the bed to a height of 4ft. 6ins. Next place the frame on it, also the greater part of the soil; the bed will gradually settle down to a height of 2ft. 6ins.. The heat engendered will be more lasting and even than would be the case if the bed had been trodden down.

Now as to the best soil. I do not use the word compost, as it is rarely necessary to have one consisting of several ingredients. Where it is possible to obtain a good yellow loam there need be no difficulty in growing fine plants in it without the aid of leaf-soil or anything else in the first place. Cover the surface of the bed with the soil to a depth of 9ins. Two plants may be grown in a frame 5ft. by 3ft., and four plants in one 6ft. by 4ft., so it will be necessary to form near the centre tiny mounds 6ins. deep on the general layer of soil; one bushel of the loam will be sufficient for each mound. The glass lights must be put on directly the soil is put in, but a small opening should be left at the top for the rank steam to escape. Even after the Melons are planted a small opening 1in. wide must be left at the top of each light as a safeguard against the tender plants being scalded. Cucumbers will grow well and bear fine fruits in a comparatively light, loose rooting medium, but Melons must have a firm soil to root in. The soil should be firmed while it is in a medium condition—neither too wet nor too dry.

Plant sturdy specimens bearing three or four rough leaves, taking care not to bury the stems lower in the soil than they were when growing in the pots. Without damaging the stems press down the soil firmly round each plant. Water will not be needed for a day or two if the plants

were watered a few hours prior to planting. If the sun shines in a clear sky it may be advisable lightly to shade the plants for several days. This, however, will be the only time when well grown Melon plants in a frame will require any shading.

Gradually increase the ventilation early each fine day and reduce it about 2 p.m., closing the lights at three o'clock on rather dull and at four o'clock on sunny days. Syringe with tepid water at closing time when the weather is bright. Train each plant towards the corners of the frame, and when the leader is about 2ft. long pinch off the tip; this will result in a free growth of side shoots, and on these the tiny fruits will be borne. Place empty inverted flower-pots under each embryo fruit, and when several on each plant are found with their flowers open simultaneously set them as follows: Take a staminate (male) flower and after removing the yellow petals insert the stigma in the centre of a pistillate (female) bloom (the one having an embryo fruit attached). This work is best done about noon on a bright day. When the young fruits are swelling nicely, pinch off the end of each shoot two or three joints beyond the fruit and also pinch—do not cut—off all useless laterals. Retain the tiny fruits throughout on the empty flower-pots. The plant should consist of a main stem with its leaves, the side shoots with their fruits and main leaves, but no sub-lateral shoots.

When applying water try not to wet the soil right up to the stems. Apply a surface mulch fortnightly or when the white roots show freely on the surface; always good loam, not broken up too much. When the fruits are swelling, and after the first mulch, begin feeding with weak doses of liquid manure and occasional applications of any artificial preparation advertised for the purpose.

When the Melons are ripening reduce the supplies of clear water and cease all feeding. Gradually increase the ventilation, and, to secure that agreeable aroma arising from the Melons and add to the sweetness of the flesh, tilt the glass lights on warm days so that a current of air may pass through the frame.

Cut the matured fruits and place them in a quite cool room or cellar for several hours before they are to be eaten, and so cut each one that the juice is retained as long as possible.

The following are some of the best sorts for growing in a frame:

Scarlet-fleshed.—Blenheim Orange, Read's Scarlet-Fleshed and Monro's Little Heath, the latter bearing suitably where a hot-bed cannot be formed.

White-fleshed.—Hero of Lockinge and Earl of Lathom.

Green-fleshed. Eastnor Castle, Exquisite and Windsor Castle.

The Cantaloupe Melon is much liked by many cultivators, and may be successfully grown in frames without a hot-bed if the glass is covered with mats every night. Where possible, however a hot-bed should be provided. GEORGE GARNER.

THE HEUCHERAS

THESE lovely hardy plants, the name of which, by the way, is correctly pronounced *Heukera*, have rapidly won their way to the front rank among dwarf border perennials. Not that they are by any means new, for many species are old inhabitants of our gardens; but the hybridist has been very busy among them, and the introduction of these new forms has given the whole genus a great impetus which has brought the older as well as the newer forms into striking prominence. And, indeed, the plant is ideal from every point of view, the tall, elegantly feathered flower spikes in contrast with the compact tufts of foliage proving especially happy. Great as the plant is when in flower, a high meed of praise must be accorded to the autumn and winter effects of the foliage, for many then take on lovely red and reddish brown hues that persist until the new leaves push out in spring and cover them.

A very important point in the culture of all species and varieties is frequent division. The plants throw out offsets freely, but as they do so the stems are pushing higher and higher out of the ground, leaving a longer and longer length of bare stem so that the only way is to break them up into single crowns and replant to the lowest leaves. If this is done in September or early spring, the plants very soon push out an abundance of roots and they flower splendidly the first year. In addition to their use in the rock garden and border, they are ideal plants for edging, though where used in this way as well as in the border, great care must be taken that the soil is well drained.

In addition to their light and graceful habit in the garden, they are really beautiful when the cloud-like sprays are cut and used as table or other decorations. This brings to mind that, by growing a few plants in pots and bringing into the cool greenhouse early in the year, an early and especially valuable display may be obtained, for not only do these flower profusely for several weeks, but they can be turned into the open air again as soon as flowering is over and forced regularly every year.

Among older species the following are all splendid plants. *H. brizoides* is a hybrid between *sanguinea* and *hispida*, with richly coloured vine-like leaves and tall spikes 2ft. to 2½ft. in length of rosy flowers. *H. gracillima* is similar in foliage, with long sprays of small pink flowers. *H. hispida* runs to between 2ft. and 3ft. when in flower, with immense spikes of small brown flowers that are most graceful, both in the garden and when cut and placed in tall vases in the house. *H. micrantha* is a most charming type of which, although the flowers are so very small, the misty cloud-like masses give a splendid effect. So good is this that when first shown both it and its rosy pink form were given the award of merit of the Royal Horticultural Society. *H. sanguinea* must, of course, be grown, for it is very free and vivid in its striking coral pink panicles.

Turning now to the newer hybrids, we find some truly lovely plants, and so lengthy a list of them that selection is very difficult. *Fantasy* is bluish white and very dainty. *Flambeaux* is the most vivid-coloured variety I have seen, more vigorous than *sanguinea*, with larger and denser spikes, rich flame red in colour; *Kilmohel White*, a good clean white with fine spike; and *Margaret*, compact habit, free in flowering, silvery rose and with very sturdy stems. *Pink Pearl*, satiny pool, is remarkable for the height to which the erect stems attain—from 2ft. to 3ft. *Rosemand*, a hybrid from *micrantha*, is coral pink in colour with freely branching stems reaching a height of 3ft. to 4ft. SANDSTONE.

GARDENING OF THE WEEK

FOR SOUTHERN GARDENS.

Fruits Under Glass.

The Vinery.—The work of pinching the lateral growths must be continued, and in the later houses the atmosphere kept moist by occasionally damping the floors and stages. It may be pointed out that the rods and leaves must not be syringed. Every encouragement should be given to Vines that were planted in the spring, so that they make healthy growth, and when the leading shoot has reached 8 ft. or 10 ft. it should be stopped. This will help the young rod to consolidate and assist it in being properly matured. New rods are often brought up from the base of the old one, especially with Black Hamburg, and where this is done it should also be stopped when it has made 10 ft. or 12 ft. of growth. Many experience a difficulty in finishing the Malvern Court variety, the berries having a pronounced tendency to split when they begin to colour. At this stage the house should be ventilated freely, both at the top and bottom, and do not stop any more of the growths. The border will not require any water if a mulch of short manure or hay is given. The atmosphere must also be kept on the dry side, and no water should be allowed in the troughs on the hot-water pipes.

The Hardy Fruit Garden.

Wall Trees.—These will need frequent attention, and such work as disbudding, thinning the fruit and spraying for insect pests must be done as needed. Peaches and Nectarines will require disbudding, and young shoots that are retained should be tied in as they become sufficiently advanced. The fruit must be thinned gradually, and weak or poor trees ought only to be allowed to carry a light crop. Watch for green and black fly, and directly any is seen spray the trees with a weak solution of insecticide. Apricot trees will need looking over for caterpillars and red spider. An insufficiency of water at the root is often the cause of the latter. If this is present, the trees should be syringed hard with clear rain water twice each day. The fruits of Plums and Cherries are swelling, and if the former are very crowded, a certain amount of thinning will be necessary. Keep the trees free from insect pests and syringe them freely during dry hot weather. The roots of wall trees may need moisture, and a good soaking should be afforded whenever water is required, or many of the fruits will turn yellow and drop.

Gooseberries.—The bushes usually bear heavy crops, but instead of thinning the fruits in the ordinary way they should be left till they attain a suitable size for tarts, bottled fruits and jam. In my mind it is one of the best fruits for dessert, so some varieties, such as Langley Gage, should be thinned freely for this purpose. Give the roots a mulching of partly decayed manure and keep the hoe at work throughout the fruit quarters.

The Flower Garden.

Biennials.—A number of biennials are grown at this period, and where cold frames are available which have recently been occupied by bedding plants the seeds may be sown in them. Rake the soil level and give a good watering prior to sowing. An open border is also a suitable place to raise the seedlings. Among the plants to be sown now are Sweet Williams, Canterbury Bells, Forget-me-nots, Alyssum saxatile, Aubrietia, Gaura Lindheimeri, Aquilegia, Michauxia campyloboides, etc. If frames are employed, the lights should be removed directly germination has taken place, and the seedlings must be transplanted when they have made two or three rough leaves, selecting a partially shaded spot in the kitchen garden.

Annuals.—These are often spoilt by being sown too thickly, and where the seedlings are likely to become crowded, thinning will be necessary. Some of the taller-growing kinds will need support, and twiggy sticks should be placed among the plants in such a way that tying will not be required.

General Work.—All parts of the garden ought to be kept as tidy as possible, and the walks should be periodically edged up with the shears, while weeds on paths may be destroyed by an application of weed-killer. The lawns should be mown each week, and banks or corners not touched by the machine mown with the scythe or clipped with shears. The hoe should be kept continually at work in all parts of the garden, and herbaceous plants staked before they are far advanced.

The Kitchen Garden.

Asparagus.—Where seed was sown to form a permanent bed, the seedlings must be thinned to 15 ins. apart. Keep the beds free from weeds,

and when cutting the "grass" from old plantations care should be taken not to injure the young shoots beneath the soil.

Celery.—Where early Celery is required a trench ought now to be prepared. It should be 1 ft. wide and a liberal quantity of manure allowed. Place the plants 6 ins. apart and transfer them to the trench before they become starved or leggy. The main crop can wait and follow early Peas.

Marrows.—These may be planted out, and they will succeed in any good garden soil, but it is advisable to dig holes and place rotten manure in the bottom. When filling the holes leave a slight depression for giving water when the weather is dry.

Onions will also require thinning, but not so severely, a few inches apart being ample. Choose showery weather if possible, and give a sprinkling of soot once a fortnight. An occasional hoeing will greatly assist this crop.

T. W. BRISCOM

(Gardener to W. R. Lysaght, Esq.),
Castleford, Chesham, Gloucestershire.

FOR NORTHERN GARDENS.

The Kitchen Garden.

Peas.—The last sowing for the season should be made in the course of the week, as June-sown Peas seldom do much good in the North. Even at the end of May it is wiser to sow a second early variety, such as Senator, than to trust to a late variety. Promptly stake previous sowings, and water crops should drought set in.

Kidney Beans.—The main sowing may now be made, and one can recommend no better variety than the well known Canadian Wonder. Allow 2 ins. between the rows and 6 ins. between the seeds in the row.

Vegetable Marrows.—Put out the plants on a south border, and if a few spadefuls of good fibrous loam can be got to form a small mound for each plant it will prove highly beneficial. Marrows are often planted in too rich soil, causing them to make gross growth with a disinclination to produce fruit. A moderately rich, rather firm rooting medium produces short-pointed growth, throwing flowers freely. The plants will be benefited by the protection, for a fortnight, of a handlight or a lidless, bottomless box covered by a sheet of glass. This will provide shelter from winds, as well as ensuring a certain amount of warmth until the plants take to the soil.

General Work.—Continue to make sowings of Lettuces, Radishes and Mustard and Cress at regular intervals. Complete the thinning of

crops and continue to make free use of the Dutch hoe.

The Flower Garden.

Bedding-Out.—Now that Pentstemons, Anthrums and Violas are so much used for massing, bedding-out at this season is not such a formidable job as it used to be; still, even as things are, a good deal of work has to be got through in as short a period as possible, so a start should be made forthwith. If spring bedders occupy the beds or borders to be planted, the ground must be cleared, moderately enriched and dug. Make a start with the hardier plants, such as Geraniums, both Zonal and Ivy-leaved; leave Begonias and Dahlias to the last. If the soil is rather dry and there are no signs of rain, the plants should be watered as the work of planting proceeds. If each individual plant is watered separately by means of a turned-down rose it will save labour and prove more beneficial to the plants than if the entire mass of soil is watered.

Sweet Peas will now be growing freely, and a look-out should be kept for any shoots that fail to catch the stakes or other supports, and they should be promptly tied in. A light dressing of nitrate of soda or other quick-acting fertiliser applied in showery weather will give increased vigour to the plants.

Climbers.—Certain quick-growing climbers require a good deal of attention during the early part of the season. Clematises of the Jackmanni type require to have the young growths nailed or tied in from time to time, and Tropaeolum speciosum, although a good climber, often requires attention in directing the young growths. Now is the time to plant Ipomoea purpurea, often called Convolvulus major, also the tall varieties of Nasturtium, and Tropaeolum canariense, the Canary Creeper.

The Rock Garden.

Annuals.—Some of the dwarf hardy annuals are very suitable for the rock garden, where they feel rather more at home than on the level. It is not yet too late to fill any vacant pockets with some of them. The following are suitable for this mode of culture: Silene pendula, Ionopsidium acule, Nictetaria selaginoides, Phacelia campanularia, and Virginian Stock, red, crimson and white.

The Hardy Fruit Garden.

Morello Cherries. As these fruit on the previous year's wood, a sufficient number of young shoots must be laid in due course. Meanwhile all surplus young wood should be pinched or cut out; 1 ins. is the ideal distance between the fruiting shoots of a given year.

CHARLES COMFORT
(Formerly Head-Gardener to Mrs. Haig, Broomfield, Davidson's Mains, Midlothian).

LET THEM ALONE AND YOU WILL REGRET IT.

Green Fly and other Aphides, Psylla, Mealy Bug, Thrips, Red Spider increase with alarming rapidity if left unchecked.

GIVE 'EM GYP NON-POISONOUS

and you will be surprised at the prompt results—the insect pests are destroyed and the foliage regains a clean and healthy appearance. Gyp is easy to mix and is perfectly safe.

Obtainable in tins at 1/3 from Grocers and Seedsmen, or in Quart tins at 3/- each, post paid, direct from Manufacturers,

EDWARD COOK & CO. Ltd., Bow, LONDON, E3.

VISITORS TO THE CHELSEA SHOW

will find their time profitably spent in looking over the magnificent collection of

The most efficient Mower on Earth

DURING the mowing Seasons of 1921-22-23 the British public invested £262,500 in the purchase of 3,500 "ATCO" Motor Mowers. Prior to that period the majority of mowing was done by hand or horse mowers at a cost per annum sufficient to pay for an "ATCO" outright. Of these 3,500 "ATCO" owners not one, to our knowledge, has met with a mowing difficulty to which the "ATCO" is not equal.

One owner writes that mowing which employed a gardener two full days is now done more efficiently in five hours with the "ATCO." At Cheadle Hulme an "ATCO" has just completed its second season without a single breakdown and without the owner having to spend a penny piece. A gardener with sufficient mowing to occupy a man and a boy six days with a push mower, now does the whole of his work in two days on less than a gallon of Petrol Mixture.

Send for Free Booklet offering FREE DEMONSTRATION on your own grass, and telling how the "ATCO" pays for itself in a year.

PRICES : 16 in. £50. 22 in. £75. 30 in. £95.

Less 5% Cash, 7 days. Cultivator extra.

PEACHES AND NECTARINES

How to grow highly coloured fruit.

THERE are several varieties of Peaches and of Nectarines which, if given the best treatment, will not be very highly coloured when quite ripe. There are others, the majority, that put on a most exquisite colour when grown in ideal conditions, but are very indifferently coloured if they are neglected.

An inexperienced cultivator generally tries to get his fruits well coloured during the two or three weeks prior to their maturing. The deep, rich but delicate tints cannot be secured in such a manner. Often enough, the late and sudden full exposure to the sun's rays results in the scalding of one side of the fruit. Furthermore, fruits exposed so late in the season do not have as rich a flavour as those exposed for a much longer period.

At this season, trees which are growing under glass and helped a little with fire-heat at night and on bad days will possess fruits fit for thinning-out. When they are about the size of small marbles the first thinning should be done. In every instance leave those fruits that grow on the fore part of the branch. At this thinning two fruits to each square foot of wall or trellis space must be left, and if there are any large leaves growing in such a position that they will eventually hide the fruits, remove them at once. Even at this early stage of growth the young Peaches and Nectarines should be quite brown, and, being small, the colour spreads all over them. Keep the fruits fully exposed from this stage, and when they are ripe they will be perfect in colour and flavour.

LEAF-BLISTER OR OUTSIDE CURL.—It is very rarely that one sees any leaves of the trees curled or blistered when grown under glass; a few near the ventilators may be affected, but trees growing in the open air are sometimes nearly ruined at this season through leaf-curl. For ten years I grew about eight fan-trained trees on a wall facing west, and as many on one facing south south-east. Result: Scarcely any leaf-curl on the former, plenty on the latter. Experiments proved that if the force of the east wind could be broken, the trees would not suffer so much. Nine-inch boards placed in an upright position, edge to wall, and 5 feet to 7 feet apart, broke the force of the wind and greatly lessened the leaf-curl. It is also necessary to success that the soil be maintained in an even state of moisture. Over-dryness of the soil at the roots tends to aggravate the evil of leaf-curl.

Manures must not be given before the first thinning-out of fruits has been done. A week afterwards judicious feeding of the trees may be started.

Book Accommodation. The management of the Belgravia Hotel, Grosvenor Gardens, S.W., so much patronised by the garden-loving public, asks us to point out that there is always a big demand for accommodation for the period of the Show and that visitors who write reserving bedroom accommodation or tables in the restaurant will receive preferential treatment. The hotel is very conveniently situated for the show-going public, being near Victoria Station and within easy reach of the show-ground. It is also quite convenient for the Royal Horticultural Hall, and its accommodation is, consequently, in considerable demand on the occasion of the R.H.S. Fortnightly Meetings.

A Beautiful Prostrate Linum.—The beautiful *Linum alpinum* is often the first of the blue members

of its race to open its flowers. There is a peculiarly quiet charm about this species with its slender shoots of a pale emerald green lying prostrate in soft, almost furry, well combed mats on the soil. These pretty growths each terminate in the large but gentle blossoms, which are a clear, almost transparent china blue, and a succession of these is maintained more or less the season through. This species is as easily grown as the allied *L. perenne*, or any of the others of its class, provided it is given a sunny place with an ample depth of free, gritty soil.

Answers to Correspondents

TREES AND SHRUBS.

SPARROWS AND WISTARIA BUDS (W. P. M.).—A quassa chip emulsion spray is often used with satisfactory results to prevent birds attacking the buds of fruit trees and bushes. It should also be efficacious in the case of the Wistaria. It might mean spraying every morning for a week or more, but when the sparrows find the taste is repeatedly bitter they will go elsewhere. Quassa chips are procurable by the pound from the chemist, and when boiling, the emulsion is improved by stirring in a little soft soap. Take care not to throw any crumbs about from the table. It is quite well known that the birds look for these, and while waiting are liable to do damage in the vicinity.

MISCELLANEOUS.

PLANT FOR IDENTIFICATION (T. W. K.).—The plant sent for identification is *Ceanothus dentatus*. This *Ceanothus* will commence to produce shoots after it has finished flowering. Propagation is effected either by cuttings, which should be inserted in sandy soil in a cold frame in autumn, or by layers, which is the quickest way of obtaining strong plants. Seeds also are produced freely on most species of *Ceanothus* and they germinate readily if sown in a little heat.

NAMES OF PLANTS.—Gardener.—1, *Prunus Padus*, "Bird Cherry"; 2, *Amelanchier canadensis*, "June Berry."—T. N., Bucks.—*Pentstemon Scutleri*.—W. F., Dorset.—*Rhododendron Lady Alice Fitzwilliam*.—W. R. J., Cheltenham.—*Celandine*.

ROYAL HORTICULTURAL SOCIETY'S Great Spring Flower Show

TO BE HELD IN THE

ROYAL HOSPITAL GARDENS, CHELSEA, LONDON, S.W.,

On TUESDAY, WEDNESDAY & THURSDAY, MAY 29th, 30th & 31st.

The Ranelagh Gardens adjoining the Show ground will be open to visitors, and provide a resting place for those who wish to sit in the shade or to meet their friends. These Gardens will also contain the Refreshment Tents.

The Catering this year will be carried out by Messrs. J. Lyons & Co., Ltd.

Arrangements have been made for chairs to be available in the Show Grounds for the use of visitors.

All Fellows of the Society are admitted free on presentation of their tickets.

PRICES OF ADMISSION TO NON-FELLOWS:

TUESDAY, May 29th	-	-	-	-	-	-	-	-	2 p.m. to 8 p.m.,	10/-
WEDNESDAY, May 30th	-	-	-	-	-	-	-	-	9 a.m. to 5 p.m.,	5/-
"	-	-	-	-	-	-	-	-	5 p.m. to 8 p.m.,	2/6
THURSDAY, May 31st	(Closes at 6 p.m.)	-	-	-	-	-	-	-	9 a.m. to 6 p.m.,	2/6

Tickets may be obtained in advance at the Society's Office, Vincent Square, Westminster. On the days of the Show, Tickets will only be on sale at the Entrances.

Book to Sloane Square Station. Carriages and Motors may not set down at the Gates near the Hospital, but must use the entrance on Chelsea Embankment.

All those who wish to become Fellows of the Society can obtain particulars on application to THE SECRETARY, Royal Horticultural Society, Vincent Square, Westminster, S.W.1.

BENSON'S GARDEN HOSE

SPECIAL 1923 OFFER.

All Hose is made 60ft. lengths. **BEST HAND-MADE GARDEN HOSE**, 60ft. best Red or Grey $\frac{1}{2}$ in. with all best Brass Fittings, 18/6 COMPLETE. This is Hose much superior to the common drab quality usually sold.

'SPECIAL RED' or GREY HOSE.

60 ft. $\frac{1}{2}$ in., fitted with Branch Rose and Jet and Royle's pattern Tap Union, 22/6
60 ft. $\frac{3}{4}$ in., " " " " " " 26/6
60 ft. 1 in., " " " " " " 32/9
This Hose is very superior, both in make and finish, to anything of the kind hitherto made. The rubber inside is seamless, thus avoiding the possibility of splitting or opening of seams which occurs with the ordinary make; also, being well frictioned on to the canvas during the process of manufacture, it is not liable to peel off. It is calculated to stand much greater pressure than the ordinary Hose, combining lightness with strength.

LANDSCAPE GARDENER. — Gentleman,
with wide experience in rock gardening and general gardening
for artistic and pictorial effect, would be glad to know of any-
one requiring the same. Can show examples of work done.—
Box 2, c/o "THE GARDEN," 20, Tavistock Street, Strand, W.C.2.

"Auto-Shreds" did it!

I just burnt them in the
ground and they thoroughly
fumigated my plants. The
judge wanted the name of
the stuff that kept my
flowers so insect-free. I
told him "Darlington's
AUTO-SHREDS." At all
seedsmen they cost

THE 'HOME GARDEN' BOOKS

No. 5

ALPINE PLANTS

By A. J. MACSELF

Founder and first Chairman of the National Hardy Plant Society
Author of 'Hardy Perennials,' &c.

Illustrated with 8 beautiful coloured plates and a fine series of black and white drawings

This thoroughly practical work brings Alpine Plants within the reach of all. Even a rockery is shown to be not indispensable. This consideration for the busy flower-lover of limited means constitutes the book's great attraction, and its clear directions will be read and followed with enthusiasm. The author has spared no pains to make his work both lucid and comprehensive. Propagation is fully dealt with, and lists are added, classifying plants under such headings as their effectiveness in winter and their requirements in the matter of sun, shade, moisture, &c. 'ALPINE PLANTS' affords help for both the expert and the beginner. 7s. 6d. net

No. 1 ROSE GARDENING

By MARY HAMPDEN

Author of 'Town Gardening,' &c.

With 8 plates in colour by Maud A. West and 50 line drawings by the Author

'The advice is good, and the illustrations, both coloured and plain, true and attractive.'—*Horticultural Advertiser*. 7s. 6d. net

No. 2 TOWN GARDENING

By MARY HAMPDEN

Author of 'Rose Gardening,' &c.

Fully illustrated from photographs, and a series of line drawings by the Author

'Very full instructions. The chapters devoted to daily routine are very helpful.'—*Garden Life*. 6s. net

No. 3 BULB GARDENING

By MARY HAMPDEN

Author of 'Rose Gardening,' 'Town Gardening,' &c.

Notes from Maidstone.

STANDARD ROSES.

For the grower of Roses, May is a month of anxiety. Our standards made unusually early growth and a severe frost would have played havoc with them. The fates, however, were kind, and we can now rely upon a very fine bed of standards all on English Briar—and not Rugosa—a point which needs no emphasis to the wise rose grower.

[JUNE 2, 1923.]

HARDY PRIMULAS

Primula nivalis and its allies and those of the *sikkimensis* section.

TO the *nivalis* section of the family belong some of the finest species, with handsome foliage and large trusses of beautiful flowers. *P. nivalis*, which may be taken as the type of the section, has a very wide distribution, extending right across the continent of Asia, from the Caucasus through Turkestan, the Himalayas, China and Siberia, to North-Western America. With such a wide range, and being found under various conditions, this species, naturally, varies to some extent, and several distinct forms from time to time have found their way into cultivation.

All the species of the *nivalis* section proper have so far proved difficult of cultivation in this country. They have the unfortunate habit of rotting off at the collar through some cause, probably damp, during the winter months, while the roots remain perfectly healthy. They seem to require other plants for company, and to be grown in positions where the crowns can be kept dry, while the roots are within easy reach of abundant moisture. During the past winter I have allowed grass and other weeds to grow along with the Primulas, only removing the stronger ones when they appeared to be overgrowing and crowding out the rightful occupants. They have come through the winter well, and have apparently benefited by this method.

On the other hand, the members of the *sikkimensis* section are easy to grow, only requiring a moist and deeply cultivated soil of a loamy character in a partly shady situation. All are readily raised from seeds when fresh, treated in the same way as most other Primulas. Taking the members of the *nivalis* section first we have

P. ANGUSTIFOLIA.—A native of the Rocky Mountains of Colorado, this is a dwarf species, only a few inches high, with narrow leaves and one-flowered scapes. The flowers are rosy lilac in colour with a pale eye.

P. CHIONANTHA is a noble species from Yunnan, where it was found by Mr. Forrest on the mountains of the Chungtien plateau at an altitude of 12,000ft. to 13,000ft. in open, alpine meadows. It is very robust in habit, with a tuft of leathery leaves 8ins. or more long and 2ins. wide at the broadest part, from which are produced the stout stems, rising from 12ins. to 20ins. in height. Like

the underpart of the leaves, the stems, pedicels and calyx are coated with a golden meal. Strong stems bear two or more whorls of flowers. These are ivory white, fragrant, nearly 1in. in diameter, and produced on drooping pedicels during the month of May. It has done well in a moist, shady position and promises to be a popular plant.

P. NIVALIS.—The type of this section is a rare plant in gardens, although it was introduced into cultivation as long ago as the year 1790. It is a handsome plant with leathery leaves, green above and mealy beneath, and bears large trusses of rosy purple flowers.

P. PARRYI.—A native of the alpine regions of the rocky mountains of Colorado, this is a bog-loving plant with bright green, erect leaves and intense crimson flowers in large trusses. The flowers have a yellow eye, while the lobes of the corolla are emarginate. One of the handsomest species, it does not flourish everywhere, but grows best when planted in moist, spongy soil that is well drained and never allowed to become stagnant. It was first introduced into this country in 1875.

P. PULCHELLA.—This is a beautiful plant from Western China, where it was found by Forrest, and introduced by Bees, Limited, in the year 1911. It has leathery leaves 4ins. to 6ins. long, denticulate on the margins, and bears trusses of six or more deep blue flowers in May. It has proved more amenable to cultivation than some of the others, and less liable to damp off during the winter. Our hot, dry summers seem more fatal to many of these plants.

P. PULCHELLOIDES.—Also from the same country as the above, but found by Kingdon Ward, it is of similar habit, with smaller lilac flowers more in a truss.

P. PURDOMII.—This beautiful plant was found by Purdom in Western Kansu, China, at an altitude of

THE FRAGRANT WHITE PRIMULA CHIONANTHA.

THE MILKY-STEMMED LILAC ROSE FLOWERED PRIMULA
PURDOMII.

Perhaps the best of the nutalis section.

PRIMULA SIKKIMENSIS, WHICH IS CALLED A ROSE PURPLE
P. SIKKIMENSIS.

This is a better plant than P. nutalis.

PRIMULA PURDOMII. This is a very like the second, but is covered with a thick, milky, sticky substance, considerably to the detriment of this species. The flowers are borne in terminal trusses of from three to twelve on stiff, sometimes slightly curved, or more or less pendulous, stems. A handsome plant, and a fine hybrid. Mr. A. V. Wright and S. C. at the meeting of the Royal Horticultural Society at Oxford, just ascertained it.

P. STRAUPHOLEA. Another handsome species from Yunnan, in West China, where it was found by Forrest growing on open moist pastures and mountains at 12,000 ft. elevation. The leafy leaves are dark green above and coated beneath with golden yellow, and grow to a length of 12 in., while the stems rise to a height of up to 2 ft. The flower stalk, like the undersides of the leaves, is covered with a golden farina. In May the rich rose-purple fragrant flowers are produced in trusses of six to twelve or more, each is about 1 in. in diameter and has a good effect.

P. SUCRATA. A handsome species which comes from the Himalayas, whence it was introduced in 1845. It has leathery, lanceolate leaves nearly 1 ft. long,

THE ROSE PURPLE FRAGRANT PRIMULA SINO-PURPUREA.

mealy below and sharply serrated. The rich golden yellow flowers are borne in umbels on stems 6 ins. to 18 ins. high in May and June.

THE SIKKIMENSIS SECTION.

P. SECUNDIFLORA. This may be called a rose-purple sikkimensis, and is one of the most alpine Primulas found on the Fichang range in North-West Yunnan. It is found there at an altitude of up to 18,000 ft., to almost the limit of perpetual snow. Forests are that in the lower meadows the plants form dense colonies, with scapes from 7 ins. to 24 ins. in height. The flowers are pendulous on the umbels, the calyx being a deep ruddy purple, having the margins of the lobes, picked out with thick lines of white farina. In colour the flowers are a beautiful shade of deep crimson, the outside being slightly paler. In this species the lobes of the corolla are entire, thus distinguishing it from *P. nutalis*, which has the corolla lobes serrate. This species has proven easy to grow and is doing well in a shady border. It is one of Forrest's finds.

P. STRAUPHOLEA (Syn. *P. Nutalis*). This was introduced by Bees, Limited in 1908, having been found by Forrest in West Yunnan. It is somewhat of the habit of *P. sikkimensis*, but is remarkable in the coloration of the flowers. The petals are pale yellow, with a crimson tinted blotch in the centre. It is a strong grower, reaching only one or two feet in height, and flowers on each in

P. SIKKIMENSIS.—The Sikkim Cowslip is a well known plant, and one of the most desirable of all the hardy species of this extensive genus. It is among the easiest kinds to grow, preferring a moist, loamy soil in a shady situation. It is an ideal plant for the waterside, raised well above, but with water within reach of the roots. In such places it grows freely with tufts of shiny green leaves and tall stems 1 ft. to 3 ft. high, bearing large trusses of drooping, fragrant, yellow flowers in May and June. *P. pseudo-sikkimensis* is the

Chinese form of the Himalayan type, and is hardly distinguishable when they are grown together. The colour varies slightly from pale primrose yellow to a deeper shade.

P. VITIIV.—Also from Western China, this plant is similar in habit to *P. secundiflora*, but differs in having slightly paler flowers with emarginate corolla lobes. It flowers at the same time in May, but the blossoms are smaller. It was introduced in 1905 by Messrs. Veitch from seed collected by Wilson. W. I.

ON LATE-FLOWERING TULIPS

THERE are Tulips—and Tulips. The large majority of those who garden at the present time only call Tulips those sections which are labelled "Parrot," "Cottage," "Breeder," "Rembrandt" and "Darwin." Anyone who watched the way of the visiting public at Vincent Square on May 8 and 9 could not fail to note how they stood before the big trade groups, and talked with the attendants and, presumably, gave orders for those they thought good. Tulips always seem to have had the faculty of loosening tongues. I will not say more than all other flowers, for I expect the Pansy, the Dahlia, the Auricula, the Orchid, the newly fledged Rhododendron, the old Carnation, the big Gooseberry (only it is not a flower) and others too numerous to mention are able to do the same. "Shop" is the real enthusiast's Heaven. A new variety comes to an expectant world. It must be seen and discussed. Thus it was when Van Ooslen of Leyden wrote "The Dutch Gardener." I quote from the work "made English" in 1703: "If the Tulips should be made common, the civilist Dealing that is in the World would thereby be taken away from Men and they would be deprived of the sweetest Communication that is among honest Men. How much acquaintance doth their Rareity not afford to knowing Artists? How many pleasant visits? How many friendly Conversations? How many solid discouragements? Certainly it is the sweetest Life of the World and a very pleasant Entertainment of our Thoughts to be thus busy with the Contemplation of Flowers." These old Hollanders were very serious over their Tulips. Not more so perhaps than the small body of the faithful who gathered round the Tulip-pans in the western annexe. These were the flowers *they* called Tulips—as for those in the body of the hall, they were all right as playthings for those who as yet have not put away childish things. This is no flight of imagination on the part of the writer. It is almost word for word the description given him by a starchy florist of the old regime—not, may I say, sneeringly or reprovingly, but with a sadness that these did not know the joy of Paradise.

Once upon a time the Tulip tents of Groom of Walworth drew to themselves the *élite* of a London season. They were not then quietly passed by on the other side as no good for a colour scheme or to deck a crowded drawing-room. These blooms are relics of the time when it was the individual bloom and not a wide expanse of colour that was supreme. They tell of quiet hours of simple enjoyment alike open to a queen and a shoemaker. Their very prinness seems out of harmony with this flamboyant age; but have any flowers given greater enjoyment? For the present they are on the shelf, and the others are everything, so of these others I must write. Personally, I would be sorry to be without any of the several sections of our late-flowering Tulips. "Let them all come," say I, only I do think those

who are unable to appreciate a first-rate Trip to Stockport, a Mabel, a Sir Joseph Paxton or a William Annibal miss a good deal.

On the occasion mentioned above, when there were seven large and small trade groups in the hall (two of which, namely, those of Messrs. Barr and Sons and Messrs. Dobbie and Co., were of gold medal excellence), only one new variety received an award of merit from the Tulip Com-

to say "yes" if it means the one that of all others catches the spectator's eye when he wants to find the brightest spot in a big muster of Tulips. Give me, I say, if I must fill my garden with brightness, Petrus Hondius, Farncombe Sanders and Pride of Haarlem. As a contrast to their brilliancies suppose we consider the more sober browns. Somehow they remind me of a well-to-do man who can afford to go quietly and unostentatiously through life—humble-minded and at peace with himself and his neighbours. Such are Garibaldi, Prince Albert and Bronze Queen. They are chosen because they have done particularly well this year. All are tall growers with fine large flowers. Garibaldi is pale and pointed; Bronze Queen, which was once a greatly admired feature among the spring flowers at Glasnevin Gardens, is round and of the colour of a rather overbaked biscuit—hence one of its synonyms, Biscuit; and Prince Albert is long and dark. Writing of browns reminds me of a little episode as we were going round judging the groups of Tulips on the 8th. As we were in front of that of the Welsh Bulb Fields,

BRITISH GROWN DARWIN AND COTTAGE TULIPS AT THE "WELSH BULB FIELDS," ST. ASAPH, NORTH WALES.

mittee. This was Alceme, put up by Messrs. R. H. Bath of Wisbech. I have never had the pleasure of meeting Mrs. Alceme, but I have heard that she was the mother of Hercules. Accordingly one imagines she must have been what we call a fine woman with a noble presence. Such, at any rate, is her namesake in the tulip world. There, she is a tall and majestic rose with a blue and white centre. For those who are especially fond of bright-looking flowers in a garden I would always advise a trial of rosy-coloured varieties. Years ago I remember how in the midst of one of the large bulb fields in Holland I steadily stalked a particularly bright spot in the far distance and found when I came up to it that it was our ancient friend Farncombe Sanders. Although it is called in the R.H.S. Tulip Book cochineal red, there is a good deal of rose in its composition. Half an hour ago I compared a fairly young bloom of Farncombe Sanders with Petrus Hondius. The similarity of shade surprised both my gardener and myself. Petrus Hondius is boomed as having the most brilliant colour in Darwin Tulips. I am disposed

Sir Daniel Hall pointed to a bowl in the front row and said, "That's a daring combination." It was a mixture of the variety which above all others may be labelled brown, for it is brown and nothing else, Dom Pedro, and the delightful pale rosy buff, The Fawn. I repeated the mixture when I got home and I like it well. Another combination which is very charming is the delicately coloured pink Darwin, with its pretty rosy interior and pale blue base and well feathered spikes of the pink *Heuchera tiarellaoides*.

I fear my disappointment is confirmed. I have grown the three so-called lily-shaped varieties—Siren, Adonis and Artemis—for a considerable time, and I have come to the conclusion that they do not suit somewhat cold gardens like my own. Adonis and Artemis at their best hardly seem wanted. I imagined when I bought them that they were the same beautiful open shape as the silvery pink Siren, which, of course, very much resembles its parent *Retroflexa*. Never once have they done themselves anything like justice. This spring they have Dobbie's love Logan Rose on one side of them and on the other

an even more taking variety, Springtime— a rose of purest ray serene. Why should these two be the picture of health and the poor Lily-flowered ones in their midst so woebegone.

Tulipa Mauriana—one of the neo-Tulips found, I think, somewhere about Aix—I, personally, call red without any qualifying epithet or explanatory phrase. I have always been attracted to it, just as I have been to the Darwin Teddy, but never before until this season have I realised how near together they are in colour. If I were asked to name three reds, I think I could not do better

than select Teddy, William Pitt (a much deeper shade) and Gesneriana major (syn. spatulata). In looking in any catalogue of a first-class firm one fully appreciates the sigh of John Gerard, who says that, in 1597, when he wrote his famous Herbal, "each new yeere bringeth fourth new plants of sundrie colours not before seene: all which to describe particularlie, were to roule Sisiphus stone, or number the sandes." It is worse now; and the multiplicity of real good varieties makes a writer's task a thankless one if he attempts to name the best. I can only

suggest good ones, knowing very well that there are as good fish in the sea as I have pulled out. In dark shades and deep purples no one can go far wrong with Faust (very dark), Marconi (purple) and Vespuccio (red-purple). In mauves Ronald Gunn (stately and tall), Euterpe (rosy mauve) and Melicette (large open bloom) take some beating. Then in edged varieties there are Prince of the Netherlands, Edmée and Massachussets—and of other colours no end, for no mention has been made of Clara Butt, Boadicea and Avis Kennicott.

JOSEPH JACOB.

THE GREAT CHELSEA SHOW

"CHELSEA" makes an appeal to the British garden-loving public greater than any other horticultural show, chiefly because the would-be gardener can there see plants arranged under natural conditions, as well as on tabling in the usual way. There is thus an obligation on the trade to display their plants in the spectacular groups in positions and aspects in which they would succeed in the garden. Some firms scrupulously fulfil this obligation; others are less careful. It should be an instruction to the judges to turn down any of these exhibits, however finely grown the plants and whatever the beauty of the arrangement, if the latter violates the conditions under which the plants will succeed. The knowledgable amateur is scarcely likely to be led astray if he places no reliance on groupings in which any one plant is to his knowledge misplaced. It is the novice in practical gardening who is usually deceived by impossible arrangements of plants. The Show this year is a really fine one, though the spell of bad weather about the middle of May was very troublesome to exhibitors. Most of the big firms prepare the larger part of their exhibits for this Show under glass, but, even so, dull draughty weather is very difficult to combat, particularly if the plants are at all backward, as fire-heat is a poor substitute for the direct light and heat of the sun. Fire-heat induces weak, drawn growth and poor-coloured unsubstantial blossoms; sunlight ensures properly ripened growth and flower thoroughly characteristic of the plant. Remembering these difficulties, no doubt, visitors will

consider the quality and variety of the exhibits as little short of marvellous.

The illustrated account which appears on page 271 and following pages has been specially written for THE GARDEN by a staff of experts specialising in the various classes of plants. As this issue will be on sale at midday on Wednesday, May 30, the preparation of the report represents a pretty considerable undertaking, but we hope and believe that it will, nevertheless, be found to contain an impartial and authoritative survey of the Show. Accounts of some of the less important sections of plants are, owing to the space already taken up by the Show report, held over till our next issue, together with the report on new plants, etc., submitted to the various Committees for award.

In last week's issue we published a forecast of the Show, which visitors should find useful in that it will help them to avoid missing interesting but perhaps not spectacular exhibits, such as Mr. Douglas's

Carnations, Mr. Herbert's Pinks or many of the exhibits of choice alpinists. Dr. Macwatt's hardy Primulas, too, represent a feature which will interest a great number of readers of THE GARDEN. These Primulas were not mentioned in the forecast, but visitors should not fail to find and note them.

The only certain way to see the whole of the exhibits is to mark out an itinerary on the plan of the tents in the official guide and scrupulously to follow it. Visitors must, of course, please themselves about the scientific tent—many of them, after all, come to "Chelsea" for amusement! The tent in which various firms display garden designs and photographs of completed gardens is another matter. No one who has a garden of his or her own should miss seeing these, for the plans show how the essential unity of a garden with many features may be obtained in a way that, owing to lack of space, the formal gardens outdoors cannot. One can see here gardens of many kinds

with features of which one may or may not approve. Sometimes, however, it is almost as useful to see what to avoid as to note ideas one would like to incorporate. In short, no one should miss the plans!

The big exhibits will be found described in another place. There is no need to recommend anyone not to miss Messrs. Wallace's Lilies, Messrs. Sutton's garden of annuals, Mr. Perry's hardy Ferns or the many other spectacular exhibits of Roses, Rhododendrons, herbaceous plants, etc., to say nothing of the formal and informal gardens outdoors.

Visitors should turn when tired to the comparatively open space of the Ranelagh Gardens.

ONE OF THE FEATURES OF MESSRS. SUTTON'S DELIGHTFUL ANNUAL GARDEN, THE VIVID ORANGE DIMORPHOTHECA AURANTIACA.

AROUND THE SHOW

The wretchedness of the weather did not prevent the King and Queen from visiting the Show and inspecting the exhibits in considerable detail. More spectacular "Chelseas" than this undoubtedly we have had, but it is doubtful if there has ever been a better, for the general quality of the exhibits is little short of marvellous. The dispiriting weather was not sufficient to damp the ardour of would-be sightseers and, as soon as the gates were thrown open to the public, there was an immediate inrush of visitors. It was generally expected that after the first influx the turnstiles would have a fairly easy time, but this did not prove to be the case. Down-pour or no down-pour, two seemingly endless streams of enthusiasts poured into the grounds from the respective entrances.

Some of the most wonderful exhibits at this great Show are always staged outdoors, and we will commence the report with the

ROCK GARDENS

The rock gardens this year are probably more interesting than usual—certainly we found them so. Not *better* than usual, be it said—more interesting! To begin with, Captain Symons-Jeune makes quite a new departure by using the rather fantastic Mendip stone, best known in the famous Cheddar cliffs. The stone, as laid, looks supremely natural, and the garden is very effectively planted. It certainly is a change from the eternal, albeit very beautiful, mountain limestone.

This latter material is used, however, by Mr. George G. Whitelegg, by Messrs. R. Tucker and Sons, and by Messrs. Clarence Elliott, Limited. Mr. Whitelegg's exhibit is effective, but is not, in our judgment, the best he has set up from a design point of view. His plants, however, are extraordinarily good, and their arrangement on the stonework is excellent. The plants are placed where they would be placed—if the gardener knew his business—in a permanent planting. Some exceptionally fine plants of *Saxifraga longifolia* should be noted, but those with the cloud-like masses of blossom in huge masses are *not* *longifolia*. They are the rarely seen *S. Cotyledon platyphylla*. Note, too, quite a colony of *Anemone sylvestris* in a form of more than usual excellence. The patch of rosy carmine is *not* *Dianthus alpinus*, but *D. alpinus* × *D. neglectus*. In another place in the garden may be seen a pure white form produced by the same cross. A list of a few other noteworthy plants must suffice, though there are many treasures in this garden. We have then, *Aquilegia glandulosa*, *Ourisia coccinea*, *Kalmia angustifolia nana*, *Edraianthus pumilio*, *Geum montanum* (true)—a rare plant in cultivation—*Parochetus communis*, *Campanula Portenschlagiana major*, and *Primula farinosa* and *P. Veitchii* both in quantity.

The adjoining iris garden, which sorts very well with the rock garden, contains such treasures as *Ambassadeur*, *Alcazar*, *Eldorado*, *Nibelungen*, *Lord of June*, *pallida Empress of India*, *pallida Celeste*, *Dejazet*, *Opera*, *ambigua*, *Lohengrin*, *Mme. Chereau* and *Isoline*, together with a fine grouping of the splendid *Primula helodoxa*.

Messrs. Tucker's rock garden is, taking it for all in all, perhaps the most pleasing in the Show, and here, too, a great quantity of interesting plants may be found. *Dodecatheons* and *Sisyrinchiums* in variety were noted, also *Primula sikkinensis*, *Daphne Cneorum*, *Gentiana Gentianella* (in the

turf), *Bellis sylvestris*, *Ethionemas*, *Cytisus kewensis* (admirably arranged), *Primula Cockburniana* and *P. Fissidell Hybrid*, *Dianthus Spencer Bickham* and *Phlox canadensis*.

to them o' nights to put a little salt on the slugs tails. Consistently with this argument Mr. Elliott has built a low (sitting height) brick stone-coped wall round three sides of a little rock garden, which wall he makes useful but we anticipate. The rockwork itself is unexceptionable in design and execution, and carries some lovely plants,

AN ALPINE MEADOW IN A PIG-TROUGH (CLARENCE ELLIOTT, LTD.)

Messrs. Clarence Elliott can generally be relied upon to shew something novel, and their exhibit this year is certainly not exceptional in that respect, though it is in every other. Mr. Elliott has come—so he says—to the conclusion that the theory that the rock garden should be quite away from the formal house surround is a delusion and a snare! Who wants—so runs his line of argument—his choice alpine in some inaccessible corner where he cannot readily take a lantern

especially a beautiful grouping of the lovely *Aquilegia glandulosa*—who grows this as well as they do at Six Hills? On the wall are placed gigantic stone pans—pig-troughs and sinks, to be precise and prosaic—filled chock-a-block with the choicest of alpine. An illustration of one of them accompanies these notes. The pan shown is indeed a veritable alpine meadow in miniature, and there seems no reason why anyone with decently pure air and a tiny backyard should not

SPLENDID ENCRUSTED SAXIFRAGES, ETC., IN MR. WHITELEGG'S GARDEN.

in this way is a large collection of Japanese. For it must be remembered that not above thirty per cent. of the plants in the pan are at the moment in bloom.

Messrs. Pallen and Son have a rockery in Sussex sandstone which is quite effective. The firm has on this occasion resisted the temptation to make a big splash, which always appeals to the great B.P., and, instead, two tiny streamlets make a pretty waters-meet. The planting is not really good enough for the stonework, but it is a pretty and interesting exhibit none the less. Messrs. Hodsons also have a rockery in sandstone.

FORMAL GARDENS

Perhaps the most attractive of the formal gardens is certainly the simplest in design. This is the rose garden exhibited by the Orpington Nurseries Company, which is planted entirely with Polyantha Roses in a setting of turf and with simple paved paths to allow dry-shod progress in the wettest weather. The proportioning of this garden is excellent.

Another excellent little garden is the iris garden shown by Messrs. Geo. Bonyard and Co. The Irises shown are June-flowering Bearded varieties which, unfortunately, will hardly be at their best during the duration of the Show. The central portion of the garden is sunken and a small oblong pool marks the centre. The centre paths are of paving, edged turf, and the outer ones of turf. The fact that this garden is not a blaze of colour has its compensations. It enables everyone to realise what beautiful effects can be obtained with the foliage of Bearded Irises alone.

Messrs. R. Neal and Sons have a somewhat ambitious scheme which is formal as regards its main feature—a curvilinear balustraded terrace overlooking a moat, beyond which are plantings

of Japanese Maples, not in very good colour, and a conventionally arranged bank of rock work, with a trickle of water in the centre. Some good clumps of Rhododendrons act as a background to the terrace.

Messrs. J. Cheal and Sons have an exhibit which might well be a stretch of suburban garden. Herbaceous borders backed with Yew hedges are on either hand. In front of these come paved paths in rectangular York self-faced paving—a material and finish always pleasant to behold—and the centre is devoted to turf with pieces of topiary to give a balancing effect to the walks. The whole is dominated by a terrace which "houses" therein a dripping well and pool in the manner now so fashionable. The terrace itself is excellently planted with a variety of trees and shrubs and the whole garden is certain to please large numbers of people.

Mr. Ernest Dixon of Putney is to be congratulated on making an entire break-away from his previous Chelsea models, which, while unexceptionable enough, have shewn little divergence one year from another. The garden shown on this occasion is restful and should be inexpensive to construct. A large proportion of it is turf, but there are no turf banks to mow, so that maintenance would be inexpensive. Steps are always a delightful garden feature and they are used freely—some would say just a little too freely—but there is no straining after effect. Wattle hurdles are used on the terrace at the upper end to represent the walls of the house. It occurs to us that for an exhibition such as this it would have been better to bring the terrace into the foreground and to look down upon the garden, thus eliminating the background problem.

Mr. Klinkert of Richmond, so well known as a specialist in topiary, has this year a well proportioned topiary walk which will certainly appeal to all lovers of this form of gardening.

The En Tont Cas Company, the proprietors of the famous hard tennis courts which bear that name, have what may be considered a model sunk garden of pleasing design, together with models set in Yew hedges of their hard court and an ordinary turf tennis court. One is glad to see that the bad old way of trying to make a hard court a feature of the garden scheme has quite dropped out.

Messrs. William Wood and Sons of Taplow, well known for their garden sundries, have a rather light semi-circular pergola at the entrance of their exhibit, backed by a hedge of well grown Thuyas. From this the way leads to a formal sunk garden with low walling and rockwork behind. The juxtaposition of rockwork and walling seems to be a feature of the Show and will be found dealt with in another place. A thatched tea-house closes the vista at the "top" of the garden. A little Nepeta and a few other touches of mauve and lavender represent all the colouring displayed here. Admitting, as we must, that colour is often too lavishly used at shows, one does feel that Messrs. Wood have, on this occasion, gone to the other extreme.

Messrs. Hodson and Sons of London and Nottingham are another firm which seem to despise colour. Their formal garden has points of interest architecturally, but colour is not used boldly enough, and when employed the effect is rather spotty.

Mr. James Macdonald does not, one presumes, often book an order to plant a garden of grasses. Rather, one imagines, the aim is to attract attention to his beautiful greensward. This notwithstanding, we must confess a sore temptation to invest in such a garden, for, as he shews it, it is indeed a thing of beauty. It is really astounding what effects can be obtained with grasses alone, and none of these in flower.

Messrs. John Waterer, Sons and Crisp, Limited, like Mr. Macdonald, evidently set out to shew

A ROCK GARDEN IN MENDIP STONE BY CAPTAIN SYMONS JEUNE.

MR. ERNEST DIXON'S TREATMENT FOR A SUBURBAN GARDEN.

Their wares in garden form rather than to lay-out a garden. As a garden, their effort could not be considered a success, but as groupings of well-grown trees and shrubs it is worth the inspection of every visitor. To take but one example, the few pieces of topiary on show are of really super-excellent quality.

Messrs. Pipers have rather hidden away a quietly beautiful little blue garden with an octagonal tank and fountain and quaint stepped brick-paved paths. Delphiniums and Ageratum are largely used, and a couple of specimen Wisterias lend distinction.

Messrs. Kent and Brydon have another exhibit in which walling and rockwork are brought into juxtaposition. The garden is full of colour and quite effective. A rather low and narrow lily-tank forms a central feature.

INFORMAL GARDENS

The most spectacular garden in the Show comes under this heading. We refer to Messrs. W. H. Gaze and Sons' exhibit in something of the "Capability" Brown style of landscape work. If this conveys little to readers, it may, perhaps, make our meaning clearer if we refer them to the rock and water garden at "The Gazeway" at Kingston, which so many readers of *THE GARDEN* seem to have visited, and which is similar in treatment though, of course, the design is different. A water splash, a pool, an extent of contoured turf, some really fine boulders of sandstone rock and a number of plants are the materials—which materials, most readers will agree, have been very pleasantly arranged and in good proportion.

Quite different in treatment is Messrs. Carter's spring garden. The firm seems to be specialising in this class of exhibit, by the way. Intermediate Bearded Irises and Dutch Irises lend the bulk of the colouring to the streamside planting, but beyond the brookside path Rhododendrons are freely and effectively used. A small colony of Candelabra Primulas we noticed particularly, because the combination of colour they offer offends our sense of colour harmony, but this is a small blemish in a well thought out scheme.

No note on the informal gardens would be complete without a reference to Messrs. R. Wallace and Co.'s garden of Lilies, Rhododendrons and Eremuri in the great tent, but the plants in this garden will be found described in their several places. Mr. Whitelegg's informal iris garden should, by rights, be included here, but it has

already been described in association with the adjacent rock garden.

TREES AND SHRUBS

Chelsea without its Rhododendrons would be like Hamlet without the Prince of Denmark; but in spite of the worst the weather could do they are here in all their old glory of colour and form and fragrance. If novelties are not conspicuous, one welcomes the old friends with a greeting not less warm for another year's acquaintance, and congratulates them for having worn so well. The collection of these shrubs shown by Messrs. Waterer, Sons and Crisp affords a display of magnificent varieties in which Corona in a full shrimpy pink is an outstanding feature. Lady Cathcart and Pink Pearl, that good old double *R. fastuosum flore pleno* and the well known Alice are also much in evidence. In addition to this superb exhibit, which well-nigh occupies one end of the marquee, the famous Twyford firm has a

full room of ornamental shrubs, with rare Rhododendrons and Azaleas, herbaceous and rock plants in the open.

Messrs. R. and G. Outlibot of Southgate specialise in hardy Azaleas, then exhibit forming a huge bank of glowing colour. The Ghent, Molis and Rustica sections are all splendidly represented at this stand. Of outstanding merit is the new Molis—*sumers* Multatuli, with immense trusses of splendid substance in a fiery colour that defies description. Southgate Wender, another of the same class, will not escape admiration in this fragrant corner of the tent, nor will one overlook the significance of the many standard forms in the grouping and the beauty of the Maples with which the latter is interpersed.

Rhododendrons are again a feature in the collection of shrubs shown by Messrs. Fletcher Brothers of Chertsey. Standard Broom, Japanese Azaleas and dwarf conifers are also here in representative numbers.

The Donard Nursery Company, as is usual, have a fine display of flowering and foliage shrubs in great variety. Conspicuous among these is the lovely blue *Ceanothus floribunda* and others of its race. A remarkably good specimen of *Linca australis* will not easily be passed by, and the same must be said of the *Leptospermum*s, which one is glad to note are getting more popular year by year. Rhododendron decorum may be seen here, and there are some fine bushes of Grevilleas, Pernettyas in berry and bloom, Berberises, *Embothrium coccineum* blazing with scarlet bangles, the lovely *Veronica Hulkeana* and rock garden conifers—to mention but one or two of a large and choice selection.

The name of Reuthe inspires visions of rare and interesting things, and the well known Keston nursery has got together a remarkably fascinating lot. Among these the visitor will be struck by the quaintly beautiful Rhododendron Keysii, with its little tubes of soft orange yellow, and arrested by the delicate loveliness of *R. yunnanense magnificum*. *R. R. cinnabarinum* and *Kewense* will also win admiration, and there are some Kahuias on this stand which will not go unmarked. An excellent specimen of the rare *Dipelta floribunda* in full bloom with *Azalea ledifolia alba* and *A. roseiflora* are notable exhibits here.

IN MESSRS. GAZE'S INFORMAL GARDEN.

The last-named Azalea is also well shown in choice gathering of its tribe among the Maples and Wistarias of Messrs. Russell of the Richmond nurseries. Vines, Bamboos and other ornamental shrubs are shown by this firm, the open air collection being especially attractive. After Rhododendrons and Azaleas one, naturally, looks for Brooms at this season, for most of the exhibiting tastes be unsatisfied, for most of the exhibitors have a fairly good round of these fragrant and graceful spring-flowering shrubs on view. Messrs. Noblett in particular make a strong feature of the genus, and have a score or more of distinct varieties on view. Some of us who may have nursed an objection to standard Brooms will probably modify our opinions when those arranged by the Woodbridge nursery are seen. Among the individual shrubs on view among these Brooms are some good specimens of *Potentilla Farreri*, *Fremontia californica* in full bloom, and *Kalmia latifolia*.

The famous Tunbridge Wells nursery of Messrs. R. Wallace and Co., Limited, have a wonderful show of Rhododendrons and Azaleas, both inside and out of doors. These, together with Japanese

the above comes, in bold contrast, another blaze of Rhododendrons and Azaleas brought by Mr. T. Lewis of Hanwell. Among these a new seedling Azalea in a refulgent orange-scarlet will not escape notice, RR. The Bride, Lord Roberts and Mrs. E. C. Stirling are also outstanding objects in this fine group.

Visitors with a *pêché* for Japanese Maples will have their fill of good things just outside the big tents, where Messrs. Fromow and Sons of Chiswick have a first-rate selection of these pretty things on view. Messrs. Pipers fully maintain the reputation that their Payswater nursery has earned for Clematises, and they also have put up a remarkable show of Rambler and Baby Polyantha Roses. Messrs. Hillier and Sons, Winchester, have an interesting group of flowering and foliage trees, and among the Roses shown by Mr. Charles Turner of The Royal Nurseries is a choice assortment of shrubs tastefully arranged. The Yokohama Nursery Company's stand makes a strong feature of dwarf conifers and Wistarias which are centuries old, and here are some fine specimens of the charming Kurume Azaleas. True to his name, Mr. William Cutbush has brought together

shrubs and hardy border flowers an almost bewildering collection, comprising every sort possible at this season. Even *Lilium auratum*, the Golden-rayed Lily of Japan, which one associates with the late summer months, is represented by splendid fragrant flowers. These are the largest of all those on show. Taller in habit, but bearing smaller creamy buff flowers, is *L. excelsum*. At the other extreme, in point of height, are the plants of *L. Thunbergianum* Yezo, less than a foot in height but bearing relatively large, widely expanded flowers of uncommon orange-crimson colour, shading to a lighter tone on the margins. A little taller, but still quite dwarf, are the spikes of *L. elegans* Orange Queen. In colour the most uncommon of all is *L. Krameri*, the Pink Lily of Japan, in which the large, tubular soft pink flowers have brilliant crimson anthers. *L. Thunbergianum maculatum* has widely open orange yellow flowers curiously splashed with crimson. In *L. elegans marmoratum maculatum* the yellow flowers are regularly and plentifully spotted with chocolate. The chaste and lovely *L. regale*, which flowers so readily as quite young seedlings is very prominent. Of almost florid colour are the spikes of *L. umbellatum* and its varieties, while the brightest of all are the slender, graceful spikes of *L. tenuifolium* well furnished with brilliant orange-scarlet flowers.

ROSES

The Rose enthusiast almost instinctively searches the exhibits for new varieties, and at Chelsea this year he finds more than usual, for almost every exhibitor has a fair show of novelties. Probably the most uncommon of the new Roses is the little group of Orange King, an erect, dwarf Polyantha, which bears little semi-double, button-like flowers of a deep bright orange colour. As a Rose it will not set the Thames on fire, but the colour is very striking. Messrs. Frank Cant and Co. have a goodly number of new Roses of outstanding merit. Captain F. S. Harvey Cant, which received a gold medal at last year's provincial show of the N.R.S., is represented by two types of blooms. The exhibition blooms on boards are of very large size and exceedingly compact, while the stand contains many blooms of smaller size, but still larger than the average and of a delightful rich pink colour. Mrs. F. S. Harvey Cant is another shapely Hybrid Tea Rose and of a pale blush reminiscent of the old favourite, *Devoniensis*. Mrs. Alfred West is a new pink Hybrid Tea Rose of merit. Mrs. E. Claxton, which is shown in fair quantity, is described as a Pillar Rose and it is a fully double bloom of good size, and its colour and rolled petals somewhat suggest a smaller and pointed *La France*. Chastity is a perpetual climber bearing good trusses of medium sized fully double blooms of pale cream yellow flowers.

Souvenir de Claudius Pernet, the new H.T. Rose of the delicious *Maréchal Niel* colour is to be seen in several exhibits, but in none is it so beautifully coloured as shown by Mr. George Prince, who also has charming branches of the yellow Banksian Rose and *Rosa ochroleuca*. Messrs. B. R. Cant and Sons shew, for the first time, a vase of Lady Dixon Hartland, a deliciously fragrant Hybrid Tea Rose of excellent shape and salmon pink colour, shaded with old gold at the base of the broad petals. Sovereign is shown in great quantity and of glorious deep yellow colour. The new pink Rose Lloyd George is to be seen in the magnificent exhibit arranged by Mr. Elisha J. Hicks, who also has Mrs. John Cook, a useful white Hybrid Tea, Margaret Horton, an orange yellow of Sunburst type, and the lovely yellow Souvenir de Claudius Pernet. Mr. Charles

A GLIMPSE IN MESSRS. WALLACE'S GARDEN OF LILIES.

Maples and other ornamental shrubs, must make an indelible impression upon anyone with a taste for colour and form when they are so admirably united as they are in these sumptuous stands. Of this firm's exhibits in other sections we comment elsewhere, and pass on to Messrs. Jackman's Clematises. In this superb collection lovers of the finest of all hardy climbing plants will note many old standard varieties still holding their own—Lady Northcliffe, *Comtesse de Bouchard*, Nellie Moser and the rest—and one or two new ones. Among the latter is a large-flowered, creamy white hybrid of distinction and promise, with a reputation for perpetual flowering. Last year's Crimson King is also a conspicuous object amid this ravishing display.

In this section Messrs. J. Cheal and Sons of Crawley shew some first-rate standards in Brooms and Azaleas, Maples in wide variety, Lilacs, *Ceanothus*s, *Philadelphus*, *Kalmias* and other flowering shrubs, a choice lot backed by a selection of dwarf conifers and other evergreens. In Hydrangeas Mr. H. J. Jones of Lewisham is once more to the fore with a great mound of this handsome shrub, and hard by the soft, cool tones of

a remarkable assortment of "cut-bushes," and another exhibitor who makes a speciality of "tree-barbering" is Mr. J. Klinkert of Richmond. Both of these displays of the topiarists' art are in the open, where also one will not overlook the Bays of Messrs. R. Green, Limited, and the stands of other specialists in the more architectural side of the gardener's world.

Though rather the worse for the weather and their long journey, the cut exhibit of flowering shrubs shown by Messrs. R. Gill and Son, is noteworthy. *Crinodendron Hookeri*, *Embothrium coccineum*, *Abutilons*, *Chanthus*, *Pittosporums*, *Buddleia Colvilleri*, *Rhododendron* species and *Ceanothuses* are all represented among a host of other rare and interesting things that will grow only in the most genial quarters of the south-west.

LILIES

Seldom have so many species and varieties of *Lilium* been on show as is the case at the large exhibit of Messrs. Wallace and Co. There they have arranged in pleasing association with various

A GARDEN OF POLYANTHA ROSES BY ORPINGTON NURSERIES CO.

Turner also shews *Souvenir de Claudius Pernet* and his new *Fairy Queen*, a pretty multiflora variety, sweetly scented, the small white blooms of which have pale yellow centres.

Leonora, a new Hybrid Tea variety of good form and rich dark crimson colour, is to be seen on the stand of Messrs. W. Paul and Son. Another relatively new Rose is *The General*, shewn by the Rev. J. H. Pemberton, who also displays *Coral Cluster* under the name of *Juliana*. His bordering of *Rosa spinosissima* makes a good finish to the stand.

What one may term the standard varieties are shewn in great profusion, and had only the sun been kind on the opening day there would have been a glorious display; but, as everything has its compensations, the dull, cold weather results in the blooms remaining fresh throughout the Show. *Covent Garden*, *Ophelia*, *Mrs. Aaron Ward*, *Lady Ashtown*, *General McArthur*, *Independence Day*, *Lady Hillingdon*, *Madame E. Herriott*, *Mrs. Elisha J. Hicks* and *Premier* are the principal Hybrid Tea varieties on view, while Messrs. Ernest Paul and Co. shew excellent vases of *Hoosier Beauty*, *Molly Sharman Crawford*, *Los Angeles* and *Madame Butterfly*.

The graceful free-flowering cluster Roses are largely shewn, both in the group of pot plants, so well arranged on the ground, and at the back of the stands of cut blooms. Messrs. W. Cutbush and Sons make a pretty effect by associating *Dorothy Perkins* with the dwarf *Ellen Poulsen* and *Lady Gay* with *Orleans Rose*. Messrs. Waterer, Sons and Crisp have a number of good standards and pillars of the free-flowering types. *Blush Rambler* and *Thousand Beauties* are excellent as shewn by Messrs. B. R. Cant and Sons, who also have very floriferous sprays of *Echo*, the dwarf *Tausendschön*. *American Pillar*, *Hiawatha* and *Lady Gay* are splendidly shewn by Messrs. W. Paul and Son.

The newest tall cluster Rose seems to be *Papa Gouchault* as shewn by Messrs. J. Piper and Son. It is somewhat like *Hiawatha*, but smaller in foliage and more rosy in colour. *Miss Flora Mitten*, in large single sprays of somewhat pale wild rose colour, is very delightful in Mr. Turner's group,

and he also has the equally charming but smaller *Ethel*, also much of the lovely wild rose colour.

CARNATIONS

Messrs. Allwood Brothers, *Wivelsfield Nurseries*, *Hayward's Heath*, exhibit a raised Carnation garden with a tall group in the centre, in which are disposed, in a great variety of vases, new and choice Perpetual-flowering Carnations in charming form and rich and varied colours. At each of the four corners of this interesting garden is a circular group of this firm's new hardy perpetual Border Carnations. They are represented by large and handsome flowers of a type hitherto

unknown. This is a quite distinct new break, and the future should have great things in store for this unique departure. A few good sorts are *Sussex Beauty*, *heliotrope*; *Sussex Supreme*, *salmon*; *Sussex Avondale*, *deep salmon pink*; and *Sussex Perfection*, *white, pencilled red*. This Carnation is made most attractive by being flanked with beds of the *Allwood Pinks*, beautifully shewn and in the best of condition. Real improvements in this type are *Jenny*, *blush pink*; and *Bryan*, a large, full, fluted flower of *salmon pink* colouring. The first *crimson Allwood* is shewn on this occasion, and bears the name of *Barbara*. It is a flower that will, doubtless, give us something larger in the near future. We must not omit to mention a trio of the newer Perpetual-flowering Carnations. They are *Chutz*, *blush mauve*, *striped claret*; *George Allwood*, *creamy salmon*; and *Wivelsfield Fancy*, *rich flesh pink, flaked rosy crimson*. A truly wonderful exhibit!

An attractive group of Perpetual-flowering Carnations is also shewn in tent No. 1 by Messrs. Stuart Low and Co., *Bush Hill Park*, *Enfield*. Some of the flowers are of exceptional merit; a few sorts calling for special mention being *Eileen Low*, *lovely rich salmon pink*; *White Pearl*, said to be a disease-resisting white sort; *Popsy*, *rich deep crimson*; *Reginald Cory*, *glowing cerise*; *Mrs. Ives*, *pink*, said to be good also for bedding. Several good perpetual *Maison Carnations* are shewn, such as *Hugh Low*, *pink*; *Hon. Charlotte Knollys*, *crimson-scarlet*; *Yvonne Holmes*, *salmon, flaked reddish salmon*; and *Mrs. Myles Kennedy*, a perpetual form of *Princess of Wales*, an exceedingly sweet-scented flower.

Near to the Embankment entrance to tent No. 2 Mr. C. Engelmann, *Saffron Walden*, *Essex*, has arranged a very beautiful exhibit of Perpetual-flowering Carnations. Huge mounds, stands and vases of new and choice sorts are arranged artistically for colour effect, and the flowers are fresh, bright and beautiful. A background formed by the side of the tent is covered with black velvet and festooned with *Smilax*. The group is finished off with foliage in variety and fringed with *Pterises*. A few of the specially noteworthy sorts are *Tarzan*,

MR. JAMES MACDONALD'S WONDERFUL GARDEN OF GRASSES.

brilliant scarlet. White Wonder, white. Saffron, yellow; Poppy, large crimson, unblended; Orange Sunstar, sport from Sunstar; Scarlet Iona, scarlet sport from Iona; Mrs. Hamilton Fellows, magenta; and Surprise, pink, a good full flower. This group merits the attention of all who are interested in Perpetual-flowering Carnations.

A very interesting group of these flowers is also shown by Messrs. Keith Luxford and Co., Harlow, Essex. There are no fewer than forty-eight vases arranged in pleasing fashion, containing all the leading varieties of proved worth. The bronze vases in which the flowers are arranged are admirably adapted to the purpose. The better flowers are White Pearl, pure white, in splendid form; Peerless, glowing cerise; Bona, salmon pink, an improved Lady Northcliffe; Cupid, pink; Saffron, yellow; Aviator, scarlet; and Carola, deep crimson, old clove colour. An interesting series.

Splendid quality characterises the handsome Carnations shown by the President of the Society, the Right Hon. Lord Lambourne, C.V.O., Bishop's

At the Embankment entrance to No. 1 Tent Sir William Cam, Bart., J.P., Wargrave Manor, Berks (gardener, Mr. Cyrus Moore), stages a grand group of Carnations in three mounds. The central mound is comprised of magnificent plants of Malmeson Carnation Princess of Wales, leaving nothing to be desired. The other two mounds represent well grown plants of the better known varieties of the Perpetual-flowering Carnations. Splendid colour, large blooms of good form on plants in excellent health and condition, represent the Carnation at its best. A background of Palms and a front edging of Ferns make a most attractive exhibit.

Mr. James Douglas this year eclipses himself with his hardy Border and Clove varieties, and his exhibit well deserves the silver cup awarded. Where so many excellent sorts are on show it is difficult to pick and choose, but Grey Douglas is certainly shown in splendid condition. The purple-edged Steerforth, too, is good, also the remarkably coloured Kelso, with strange sunset lightings of apricot and purple. Bookham Flame

sweet), Youth (we believe an American novelty) Orchid (superb), Mary Rose (a rose novelty for 1924), Geo. Shawyer, Hawlmark Pink, Austin Frederick (lavender), Mrs. Arnold Hitchcock, Royal Scot and Dobbie's Cream (a superb cream sort). Foliage plants and sprays of Asparagus Sprengeri make a charming finish.

Messrs. James Carter and Co., Raynes Park, S.W., exhibit a large number of bowls arranged with Sweet Peas in the large and varied group at the Embankment entrance to No. 1 tent. The Peas are well grown and are charmingly diverse in regard to colour. Specially good are the varieties Delight, White Perfection, Princess Patricia, Luxor, Duchess of York (blue), Mrs. H. J. Daumer, Frilled Lavender and Seedling Cream.

Another superb exhibit of Sweet Peas is shown by Messrs. Alex. Dickson and Sons, Hawlmark, Belfast. There are no fewer than sixty stands, vases and bowls all arranged in most dainty fashion, so that the Sweet Pea is seen at its best. The stands at the back of the group include, among other good things, the novelties Champagne (a lovely primrose cream), Lucifer (a magnificent cerise novelty), Celeste (a lovely frilled lavender novelty), Purple Perfection (a superb purple novelty that should be in every collection), Tangerine Improved (marvellously rich orange), Powerscourt (ideal lavender sort), Hawlmark Pink, The President and Faerie Queen—all in ideal form and condition. The vases and bowls contain many gems of the collection, of which we must mention Hawlmark Maroon, King Mauve, Elegance, Jean Ireland, Daisybud and Constance Hinton. As an exhibit this is a fine effort, and no visitor should miss it in No. 2 tent.

In the same tent Mr. J. Stevenson, Wimborne, sets up a pretty table group of modest dimensions, but good nevertheless. He has some charming novelties, such as Poppy (orange), Diana (lavender), Delight (soft pink), Wild Rose (wild rose colour), Fair Lady (cream pink bicolor), Austin Frederick Improved (mauve lavender) and Felicity (flesh pink).

In the middle of No. 2 tent Messrs. Sutton and Sons, Reading, have a unique display of well grown Sweet Peas. There are bowls and baskets, arranged in festoons, with Palms surmounted on pillars, and the whole draped with black velvet and embellished with beautiful Maidenhair Ferns and Asparagus Sprengeri. We have a liking for Powerscourt, Edward Cowdy (orange), Lavender Belle (lavender), Sensation (scarlet), Hawlmark Pink (pink), Constance Hinton (white), Jean Ireland, Hebe, Dignity and Frilled Beauty. A really beautiful series.

Messrs. Robert Bolton and Son, Baythorne End, near Halstead, Essex, always make a highly creditable display, and this year their exhibit well maintains their reputation as Sweet Pea specialists. It is made in No. 2 tent, and comprises a large number of golden baskets filled with Sweet Peas of the very best. There is not a poor specimen in the whole series. Especially noteworthy are the following sorts: Powerscourt (light lavender, superb), Comrade (buff cream), Wizard (scarlet-orange), Daffodil (creamy primrose), Tangerine Improved (orange), Picture (cream pink), Skylight, Bonfire (bicolor) and Faerie Queen—all very beautiful.

Immediately behind the last-mentioned exhibit is to be found a dainty display of Sweet Peas from Messrs. Andrew Ireland and Hitchcock, Mark's Tey, Essex. Good, clean blooms of large size and beautiful character comprise this attractive display. We are much attracted by Mascott's Hebe (lavender), Shaurock (rich mauve lavender), Glory (salmon pink), Mrs. T. Jones (rich lavender), Tangerine Improved, Matchless (rich cream) and Mascott's White—all beautiful varieties.

A MARVELLOUS GROUP OF HARDY FERNS BY PERRY'S HARDY PLANT FARM.

Hall, Romford. Of the Malmeson type there are Hon. Charlotte Knollys and Mrs. O. Knoph. Perpetual-flowering sorts are well done as seen in such varieties as Scarlet Carola, Brilliant, Tarzan, Thor, Destiny, White Enchantress and many others. For a private grower, this display is highly meritorious.

A number of vases, baskets and other utensils arranged with Carnations is shown by Messrs. W. Cutbush and Sons, Barnet, Herts, in their large group at the Embankment entrance to No. 2 Tent. Their better sorts are Prince of Wales (puce coloured, a sport from King Arthur, a well known border variety), Renown (flesh pink), Peerless (crise), Baroness de Breinen (soft pink, very large) and Aviator (rich scarlet). These stands, etc., are disposed in pleasing fashion among foliage plants.

A small table group of Perpetual-flowering Carnations is shown by Mr. C. H. Taulevin, Willaston, near Birkenhead. This is to be seen in No. 2 Tent, and contains good specimen blooms of Cecilia (grand yellow), Enchantress Supreme, Saffron (lovely pale yellow), Robin Clover (buff flaked rose), Kenneth (mauve), Grace (mauve flaked crimson) and Triumph (deep crimson).

represents quite a new colouring, but is well named—the "flames," however, have an apricot rather than a scarlet tone. Fair Ellen (a lovely lavender flake), Lieutenant Sharkleton, the new Brilliant (canary yellow, flaked scarlet) and Bookham Salmon are other noteworthy varieties; and the new race of Douglas Cloves is well represented. The novelty Wonder Clove of reddish scarlet tone is attracting especial attention. A fine new Malmeson variety of bright apricot colouring and called Sultan is also noteworthy.

SWEET PEAS

Truly superb is the exhibit put up by Messrs. Dobbie and Co., Limited, Edinburgh. This is to be seen in No. 1 tent, and comprises about fifty stands and vases arranged in most artistic fashion. The flowers are in the pink of condition, and represent the newest and best as well as the more noteworthy of the standard varieties. Each vase and stand speaks for itself, and shows the variety at its best. Varieties that call for special mention are Jean Ireland, Royal Sovereign (an orange novelty for 1924), Picture, Dignity (very

The Preston Hall Nurseries, Industrial Settlements (Inc.), Aylesford, Kent, make a most praiseworthy exhibit of Sweet Peas in No. 2 tent. A goodly number of stands are neatly arranged with flowers of good quality, including such sorts as Mascott's Helio, Barbara, Royal Purple, Edna May Improved, Giant Attraction, Mrs. Arnold Hitchcock, Sunset, Tangerine Improved, Mrs. Tom Jones, Royal Scot and Mascott's White. A really interesting exhibit!

IRISES

"Flower of light! All colour and all form,
The very curve of beauty in thee dwells.
Not even the multitudinous Sea, and all its
shells,

Whether in halycon calm it laughs, or swells
Magnificent in mountain-billowed storm,
Shows curves like thine, so carven, yet so free,
Nor Phidias knew, nor could Apelles see
More perfect form or colour than in thee."

Take good heed of the Irises. If you are a true flower-lover the day will come, if it is not now here, when you will worship the "Fleur de Luce" with the ecstasy of the poet quoted above, whose word painting is the work of the artist who delivers his message with a broad, free-brush. The Iris is no longer the mere "flag" of a generation ago; it is the flower of the florist, the connoisseur, the critic. So introspective, indeed, is the study of this flower among the experts that some imagine they can detect the mental process going on behind the work of the leading hybridisers! However that may be, many ardent admirers will think of Chelsea only as a venue where they may see and compare all that is new and notable in the Iris world. What is Wallace shewing this year, what of the Orpington Irises, and what comes from Perry and Bunyard?

It has been an unkind season, and as this great flower show of the world comes just on the earlier fringe of the flowering season of the tall Bearded Irises, some of the leading growers are but poorly represented this year. Still, there is much to see, and to be thankful for being able to see. The attendants at Messrs. Wallace's exhibit will have

A FORMAL IRIS GARDEN BY MESSRS. G. BUNYARD AND CO.

many requests to point out Bruno, that mystery flower, the parentage of which Mr. Bliss will keep behind sealed lips. When the pedigree is published, he says, no one will want to believe him; but no one could doubt a word Mr. Bliss says when he speaks without jest, so we shall have to look wise and say nothing if he tells us it comes from *Pseudacorus* \times *stylosa*! Bruno is a great and a commanding Iris; but here, too, you will find Souv. de Mme. Gaudichau, in the writer's esteem, the most fascinating of all the Bearded Irises. The standards are violet silk and the falls violet-purple velvet, but the texture has a lustre and finish that human fabric makers could never imitate. This jewel was raised by M. Millet, and is one of a group of extremely high-grade flowers emanating from French raisers. Other leading varieties to note are Asia, raised by Mr. Yeld, the originator of Lord of June, which comes

near to being the most widely grown Iris on the market. Ann Page, one of Sir Arthur Hort's most beautiful seedlings, robed in soft pale purple, a royal Iris in a royal colour. Ferdinand and Hubert and Kharput are also new and good, while among the better-known sorts Aznre, Alcazar, Gold Crest and Diadem are very fine.

Mr. Percy Murrell of the Orpington Nurseries Company has a magnificent lot of Irises, containing some of the newest creations of Mr. Bliss and Mr. Dykes. The eye will soon capture a remarkable seedling from the latter, the colour of which is almost impossible to describe. It is marked Riccardii \times serbica, and both standards and falls have a cream ground faintly suffused and veined pale mauve, the haft shewing strong reticulations of a warmer colour on a yellow ground. The ruffling of the edges of the standards gives a pretty effect to a very novel and delightful flower. Near by are some fine members of what is now known as the Dominion race. Of Glamour one had heard but not previously seen, and it suffers nothing in the seeing. It is a refined flower of lovely form, yet a giant in size, the rich, massive falls of reddish violet contrasting finely with the lighter-toned standards, which give the impression of heliotrope tinged with lilac and yellow. Canopus (accent on the "o" as in the warship) is another giant Dominion. This takes after the colour style of Alcazar, but glorified considerably. The segments are very smooth and of refined texture, deep pansy violet with beautifully reticulated hafts, and the arching standards are reddish violet. Titan is aptly named, as it is the largest of all the Dominion class and carries a bluer tone throughout the flower than any other of its kind. Moa, too, must be seen—quite new, very striking and well placed for observation. Going back to Mr. Dyke's gifts to the Iris world, we note Aphrodite claiming attention alike for its unusual colour, its sweet perfume and its lovely form. Both standards and falls are violet pink, without veining, giving a smooth self-coloured effect, and though the blooms are not titanic in size like some just described, it is very free-flowering and graceful. Sapphire is here, too, also originated by Mr. Dykes. Dauphin's Blue is the correct tone to describe it, and it is adorned with a brilliant yellow beard like the older Gold-crest, but is something near a fortnight earlier to bloom than that variety. It would be

AND AN INFORMAL ONE BY MR. GEORGE G. WHITELEGG.

impossible to detail all the surprising things in this exhibit, but before leaving it we must do tribute to Shekinah, which holds a unique place as the best yellow Iris in cultivation. Its growth and broad glaucous foliage indicate Pallida blood, which makes the flower colour all the more striking. This is an American introduction raised by Miss Grace Sturtevant, who gave us also Queen Caterina and Afterglow, to mention only two more of her achievements which have gained honour in this country. One can see in this group, too, Lent A. Williamson, generally accepted as the greatest seedling ever raised across the Atlantic.

One hardly knows where to begin or what to single out for notice in Mr. Perry's huge group of Irises, but it is rich in new Pallida seedlings of great merit, which form a striking feature of the display. Particularly conspicuous, too, is a large rosy bronze flower named after the President of the R.H.S.; another, Mrs. H. F. Bowles, in soft brown suffused with old gold; Miss Gladys Roberts, a self flower of rosy violet; and Duke of York in peculiar smoky blue. Kulan Tith has

This year's object-lesson in annual gardening is visualised in Messrs. Sutton's extraordinarily huge and well staged ground display, which strikes a new note in design and colour scheme. The centre is a group of separate beds filled with *Salpiglossis* in bronze shades, blue veined with gold, rich purple, crimson veined gold and golden yellow. The whole centre group is carpeted with blue *Lobelia* and edged with white *Alyssum*. Surrounding the centre are other beds of *Viscaria* in pure white, delicate pink, blue and cardinal. The four corner beds in this portion of the display are filled with blue *Cornflowers* and *Dimorphotheca aurantiaca*, the shining orange Daisy of Namaqualand, from which rise tall plants of *Nicotiana affinis*. The edging beds are masses of *Phlox Drummondii* and *Nemesia Suttoni*, the former giving splashes of fiery red and white. The *Nemesias* are very well grown and form an object lesson on the real use of this precious plant for bedding. The different varieties are distinguished by colour names, for instance, Rich Orange, Rose Pink, White, Pink Beauty and Blue Gem; but Twilight is a

Peaches, Nectarines, Plums and Cherries. The fruits are of the highest quality and excellently coloured. Among those shown are Peaches Peregrine and Kestrel; Nectarines Early Rivers and Lord Napier; and Cherries Belle de St. Tronc and Early Rivers.

The only exhibit of vegetables is staged by the Hon. Vicary Gibbs (gardener, Mr. Edwin Beckett). It is one of those fine exhibits that we always expect from Aldenham. Here are to be seen vegetables of all descriptions, including Tomatoes (Sutton's Peach Blow and Golden Perfection) Marrows, Potatoes, Radishes (including White Olive), Cucumbers, Carrots, Beet, Peas, Kohl Rabi, Celery, Beans and *Oxalis tuberosa*.

Messrs. Laxton Brothers have in the open fair-trained and gridiron cordon fruit trees. Messrs. Spooner and Sons of Hounslow also have in the open a fine lot of trained Currant and Gooseberry bushes in pots.

STOVE AND GREENHOUSE PLANTS

At the Chelsea Hospital entrance to tent No. 1 there is to be found a quite unique group of Hydrangeas. This is set up in circular form by Mr. H. J. Jones, Ryecroft Nurseries, Lewisham, S.E., and is one of the most beautiful exhibits in the whole of this great Show. Hydrangeas in charming variety both in regard to colour and form are to be seen in this chaste and dainty exhibit. Never has this plant been seen in such highly attractive character. The colours are pleasingly diverse and the form leaves nothing to be desired. The colours range from the softest tones of pink to the richest hues of rose, other colours are heliotrope, lilac, carmine, salmon pink, and many more too numerous to mention. The form, too, is so pretty. A few specially good sorts are Krimhild (salmon rose), Maréchal Foch (heliotrope pink), Gudrun (pink), Parzival (blood red), Lilie Mouillière (deep pink), Satinette (carmine red) and Etincelant (carmine), one of the finest for colour.

The Yokohama Nursery Company, Craven House, Kingsway, W.C., make an interesting table group in tent No. 2, comprising a large number of dwarfed trees and shrubs in dainty Japanese pots, bowls and other utensils. Some of the specimens are specially noteworthy, such as *Thuya obtusa* (120 years old), *Pinus pentaphylla* (45 years old), *Wistaria brachybotrys* (25 years old), *W. chinensis* (30 years old), but there are a number of other most interesting specimens.

A semicircular group of Show Pelargoniums, grown and exhibited by a well known enthusiast, Mr. A. F. Wootton, K.C., Downs Road, Epsom (gardener, Mr. W. Lamson), calls for special notice. Well grown plants of these are charmingly disposed with *Acer Negundo*, Palms and Maiden-hair Fern all used to create a pleasing finish. Some of the better Pelargoniums, many of which, we understand, are seedling sorts, are Exmouthiar, Queen Mary, Cardiff, Mrs. Lamson, Cerise Lady Beatty, Devonshire Cream, and Chieftain.

Quaint and curious are the many plants which form the table group, in tent No. 1, exhibited by Miss Worth, The Priory, Holbeach. This group comprises about five hundred plants of Cacti and Succulents in about three hundred varieties. A few specially noteworthy sorts are *Opuntia Ursina* (Grisly Bear), *Echinocactus Grusonii* (the Pincushion Cactus), *Tabularis cristata*, *Cereus peruvianus monstrosus* and *Mamillarias*, including the Hedgehog Cactus (*M. echinata*), besides many other rare sorts.

A VERITABLE GARDEN OF ANNUALS (SUTTON AND SONS.)

violet mauve standards with a distinctive lighting up towards the edges, and Lt. Bernard Galloway is robed in gorgeous reddish mauve. Abenda and Bertrand are excellent types of the newer frises, but a careful inspection of this group must be made with the assistance of Mr. Perry's genial instruction if available.

Outside, as it was last year, Messrs. Bunyard have a pleasantly laid out formal iris garden, the specially noteworthy flowers here being a fine selection of the great French seedlings; for instance, Ambassadeur, magnifica, Ballerine, Cluny, Dejaset and Cherubim from the famous house of Vilmorin, and Corida from M. Millet. If only the sun would shine and help this perfect setting for the Iris, Messrs. Bunyard's garden would be one of the sights of the Show.

HARDY ANNUALS

And the most beautiful annual of the lot is Chelsea Show, that milestone which marks off the successive stages of floral development, in which the annual plant itself occupies a not insignificant position.

fascinating blossom in white and soft mauve, the mauve petals having a rose reverse.

FRUIT AND VEGETABLES

Messrs. George Bunyard and Co., Limited, of Maidstone, have, as usual, a fine exhibit of Apples. The fruits, arranged in baskets, are of first-rate quality and beautifully coloured. This exhibit well shows the keeping qualities of the different varieties. Here are to be seen such well known sorts as Cox's Orange Pippin, Bramley's Seedling, Wagener, Newton Wonder, Encore, Bowhill Pippin, Allen's Everlasting, Lane's Prince Albert, Claygate Pearmain and Norman's Pippin.

Messrs. Laxton Brothers of Bedford are showing their Strawberries. These fruits are tastefully arranged in baskets, and plants growing in pots are also on show. The fruits are of good size and excellent quality. Such sorts as King George, The Duke, Sir Douglas Haig and Marshal Foch are shown.

Messrs. T. Rivers and Son, Limited, of Sawbridge-worth have a large exhibit of pot fruits, including

In next week's issue we shall publish detailed comments on further Stove and Greenhouse Plants, Herbaceous and Rock Plants, Orchids, etc., and Garden Sundries, with descriptions of noteworthy New and Rare Plants.

CORRESPONDENCE

NEW DUTCH HYBRID RHODODENDRONS.

IN the spring of 1921 the Dutch growers, Messrs. C. B. Van Nes and Son and M. Koster and Sons invited me to inspect a series of new hybrid Rhododendrons which they had raised during the past ten years. When I went to Boskoop in May I was prepared to see a good many failures, as one must always expect from the breeding of double or treble mongrels, with perhaps a few successes; but these two firms have been so ruthless in their elimination of all except the very best that their plants will in the future rank very high among late hybrids of fine colour and size. To show how severe they have been with their own plants Mr. C. B. Van Nes told me he had raised 250,000, and out of this he had retained exactly 200. Messrs. Van Nes shewed a few of their varieties on April 28 at the R.H.S., but as these were cut trusses they did not exhibit their best qualities. Messrs. M. Koster and Sons are to shew at Chelsea about 100 plants in pots, comprising twenty-four varieties (several plants of each) of their chief successes, and I shall be much surprised if they do not create interest among lovers of Rhododendrons. I consider some of the pinks, whites and rose-coloured varieties have not been surpassed by previous breeders. I hold no brief for the Dutch growers and am only sorry that these new plants were not raised by some English nurserymen. But we can no more avoid the existence of some new thing if it is really good than we can "keep a good man down." It speaks for itself, and good judges are quick to mark progress in any line, be it British or foreign. As I have already flowered nearly all the varieties to be exhibited by Messrs. M. Koster and Sons, I give the following notes as taken in my garden in 1922:

M.K. No. 112, R. Mrs. Robert Wallace.—Large truss of R. Aucklandii form, pale pink fading to white, heavily spotted on upper lobe with scarlet-crimson, rose-tinted exterior to flower.

M.K. No. 114, R. Corry Koster.—Large truss, light pink, frilled edges, heavily spotted crimson on upper lobe, crimson style, fine leaves.

M.K. No. 106, R. Peter Koster.—Fine truss, brilliant crimson and pink edges, stamens and style crimson, dark centre. A remarkable Rhododendron.

M.K. No. 131, R. Mrs. Charles Pearson.—Immense truss, pale blush mauve, heavily spotted upper lobe with burnt sienna; fades to white; good dark leaves.

M.K. No. 152.—Immense truss of pale lilac rose, slightly spotted crimson upper lobe. This plant was much admired at Ghent Exhibition.

R. Mme. de Bruin.—Fine truss, brilliant cerise-red. A very showy plant.

M.K. No. 149.—One of the best, deep salmon with pale pink edges.

M.K. No. 96, R. Sophia Gray.—Large truss of rich pink, upper lobe heavily spotted burnt umber, frilled edges. Very beautiful.

M.K. No. 157, R. Hugh Wormald.—Large truss of bright cerise pink; down the centre of each interior lobe a white stripe. Buds before opening, a shining crimson. A remarkable Rhododendron, unlike any other hybrid.

M.K. No. 170, R. Mrs. Lindsay Smith.—Large upright truss of pure white, slightly spotted red on upper lobe. The best white Rhododendron introduced since R. Loder's White.

M.K. No. 163, R. Rosamond Millais.—Brilliant red-cerise, large truss heavily blotched burnt umber. A refined and beautiful plant.

M.K. No. 103.—Large truss with rose pink margins and pale interior.

M.K. No. 132.—Large rose pink truss.

Also about ten other fine pink varieties.

Messrs. Koster will also shew about fifty plants of their new Mollis Azalea (R. japonicum) named Koster's Brilliant Red. This and a seedling named C. B. Van Nes raised by Van Nes are the two best Mollis of recent years and surpass in beauty J. C. Van Tol and the old Alphonse Lavallée.

—JOHN G. MILLAIS.

ERINUS ALPINUS.

THIS little plant much prefers to go its own way; to sow itself and grow where it pleases. Though it may be transplanted, it is not safe to depend on this for any show of its best behaviour. But it will do well if it is sown in the joints of a dry wall or any mossy places in stonework. It

MASSSES OF THE PURPLISH ERINUS ALPINUS IN STEPS.

has a special liking for some place where it can get its back up against a wall. Such a place is shewn in the illustration, where year after year it grows self-sown in the very meagre amount of mossy stuff that accumulates in the angles of a flight of rough stone steps that lead to a loft.—G. J.

PELARGONIUMS WITH BEAUTIFUL FOLIAGE.

REFERRING to the note upon this subject (page 251), my father (the late J. R. Pearson) was quite as keen about tricolors as he was about the other Zonals. I well remember his coming home with his first plant of Mrs. Pollock, a small rooted cutting with three leaves, for which he had paid three guineas; this must be nearly sixty years ago. He raised some very fine golden tricolors. William Sanday (mentioned in the note), named after his friend the shorthorn cattle breeder, and Mrs. Walter, named after the widow of John Walter of the *Times*, occur to my memory. I think William Sanday was one of the best, and

I was fortunate enough to get some plants of this from Messrs. Wood and Ingram, Huntingdon, which I have grown in my own garden for some years past for old times sake. With golden tricolors the flowers are no addition to their beauty, but with the silver tricolors they harmonise well. I think Flower of Spring was one of the silvers that my father raised, but it is so long since we grew Pelargoniums that one forgets many of the names once so famous. Henry Jacoby was the crimson Zonal for many years.—A. H. PEARSON, *Lowdham*.

OXALIS MAGELLANICA.

WITH reference to Mr. Clarence Elliott's note on this charming little Oxalis (April 21, page 196) and his regrets at not knowing its habitat, I would like to tell him that this plant inhabits the colder of the Antarctic Islands, and for all I know it strays over from Tierra del Fuego to the mainland of South America. As I write I have just received a letter from Mrs. Brown of

Mottistone, Isle of Wight, a keen gardener and botanist, to whom I had recently the pleasure of introducing this plant. She sends me an extract from *THE GARDEN* of April 16, 1904, in which a Mr. Bathgath of Dunedin, New Zealand, relates his plant collecting experiences in the Otago range, where he found at an elevation of about 5,000ft. both the weedy *Oxalis corniculata* and, as he terms it, "its white cousin *O. magellanica*" both in flower. This would appear to be its most northern habitat as far as I can trace its distribution at present. The plant has a great but quiet charm, and has been a favourite with me for years, and has never made a nuisance of itself, as so many of its relatives which consent to flourish with us at all are only too apt to do.—W. E. TH. INGWERSEN.

A NEGLECTED FRUIT.

DURING my perambulations round the gardens of my friends I have never yet come across a cranberry-bed. Yet these plants are quite easy to grow. A bed once made lasts for many

It is properly constructed it yields large crops, and all fruits it should commend itself to our horticulturists, as it is never at its best till after a frost, and it continues to be at its best through the winter. Cranberry tarts, cranberry jam and jelly and stewed cranberries are all excellent. In the garden of my youth there were cranberry-beds, planted with the large Canadian Cranberries, with fruit as large as Kentish cherries. The crop never failed, though some years produced more fruit than others. They required no protection, as apparently no birds except pheasants care for Cranberries; moorland birds may like them, but these beds were in the South of England. I am aware that large importations of foreign Cranberries arrive in England in the winter; but, like all imported fruit, it compares badly with that fresh from the plant. The only requirement that may present some difficulty is water; a constant supply round the beds seems a necessity. But running water is not required; a tap that can be turned on occasionally is all that is necessary.—MARGARET BICKERSTETH.

THE NAMING OF PLANTS.

REGINALD FARRER, in the Preface to his "English Rock Garden," describes the efforts he made to get his names right, and the principle on which he proceeded—namely, that the proper name of a species is that which was given to it in its oldest authoritative description. That is the orthodox principle, the only one on which he could proceed if he aimed at consistency; and we must all be grateful to him for his labours. But the results are disconcerting, as I will shew by a few examples out of many. There are three well known *Æthionemas*, which most rock gardeners grow, and which most of them call *Æ. grandiflorum*, *Æ. pulchellum* and *Æ. coridifolium*. But Farrer tells us that, though the first appears in every list, it is doubtful whether the genuine species is to be found in cultivation at all, that *Æ. pulchellum* is called *Æ. coridifolium* in many gardens, and that *Æ. coridifolium* is the most abused name of the race. I cannot discover from Farrer what is the true name of the plant usually grown and sold as *Æ. grandiflorum*. There is also a distinct plant commonly called *Iberis jucunda* but, according to Farrer, that name is only a synonym for *Æ. coridifolium*; and, again, I cannot discover what is the true name of the plant commonly called *Æ. coridifolium*. All I can discover is that the names of all my three *Æthionemas* are wrong.

Again, I have a well known little plant commonly called *Erodium guttatum* with white flowers spotted with dark puce; but Farrer says that *E. guttatum* has flowers pink but spotted. He also says that the flowers of *E. pelargonifolium* are "as in *E. Gussonei*," and these he says are of a deep unspotted pink with darker stripes, whereas my *E. pelargonifolium*, again a well known plant and commonly called by that name, has white, or almost white, spotted flowers. These examples I have chosen almost at random out of hundreds, not with the object of making any complaint against Farrer, but to shew how great is the present confusion of names and how it troubles both nurserymen and gardeners. I have indeed, that Farrer's book will increase the confusion, for conscientious nurserymen will try to revise the names in their catalogues and produce something more bewildering than ever.

I find Melbourne's dictum, "his Cabinet," "It doesn't matter what we sell, provided we all say the same thing," and that, if it is true of a Cabinet, is true of the naming of plants. What is needed is a set of names that everyone will use, and these can be established for all the world only by an international authority; but if we cannot get an

authority, Kew or the R.H.S. might do it for England. As to the principle on which Farrer proceeded, namely, to accept the name given in the oldest authoritative description, that is well enough where there is no accepted authority, but it has this drawback, as he himself insists, that you have to find the oldest description—a process of laborious research and liable to error. I suggest that an authoritative list should, wherever possible, choose the name in common use—that it should continue to call *Campanula Allionii* by that name and not *C. alpestris*. So the labours of the compilers would be lightened and the perplexity of gardeners and nurserymen would not be increased.

Finally, I am aware of the existence of the "Kew Index," but that is not universally accepted. It is not accepted by Farrer, for instance; and what we need is an authority that everyone will accept. At present, because of the lack of that

Snowflake. It is a native of Central and Southern Europe, and is also found growing in the damp meadows in the South-Eastern and South Midland parts of England, being one of the most beautiful of our native plants. The large, drooping, bell-shaped flowers (which are upright in the bud stage) are pure white and about 1 in. long, each segment being tipped with a bright green ovate spot. They are borne during April and May in clusters of from three to six on a two-edged scape from 2½ ft. to 3 ft. high, well above the strap-shaped foliage. It is a plant that will adapt itself to almost any soil or position, particularly where the ground is moist, although one occasionally reads that the bulbs should be planted in well drained soil, which is misleading, for to see them at their best they should be planted along the side of water. I have seen them along the banks of the Thames, where large stretches of them are at home, growing luxuriantly and blooming most

THE SUMMER SNOWFLAKE BY THE WATERSIDE.

authority, individual efforts like those of Farrer only increase the confusion.—A. CLUTTON BROCK.

THE SUMMER SNOWFLAKE.

THE *Leucojums*, or Snowflakes as they are commonly called, are among the most beautiful of our bulbous plants, and a genus that gives a display over quite a long season, for one or other of the species help to decorate our garden or woodland from early spring until autumn. They are closely allied to the Snowdrop, one of the chief differences being in the length of the segments. In the Snowdrop the three outer ones are longer than the three inner ones, while in the Snowflake they are all the same length. Some of the smaller-flowering species sometimes go under the generic name of *Aris*, but apart from their flowers being smaller, there seems little reason for separating them from *Leucojum*. Most of the species are slightly scented, and one can imagine the fragrance to resemble that of Violets. Perhaps this is why Parkinson in his "*Poa-lisus terrestris*" gave them the name of Bulbous Violets. The subject of this note, however, is *Leucojum aestivum*, the Summer

profusely. Here their bulbs stand in the wet mud the whole year round and at times they are well under water. At the place I have in mind the Snowflake could be gathered in large quantities were it allowed, but, fortunately, the gathering of wild flowers along the Thames bank is prohibited, so that this beautiful flower is allowed to go on growing and increasing. True, it will grow in a border and even in a dry one, but the plants compare sadly with those in happier circumstances. They grow weakly, while the flowers are much smaller than those by the waterside, although they usually flower earlier. The true plant is not often met in cultivation, *Leucojum pulchellum*, a native of South Europe, often doing duty for it under the name of *L. aestivum*. *L. pulchellum*, however, has narrower leaves and smaller flowers, the perianth segments are more incurved, and the blooms are produced quite three weeks or a month earlier. *Leucojums* can be increased by division of the clumps of bulbs, or are readily raised from seeds, which are about the size of those of the Sweet Pea, and should be sown as soon as ripe.—F. G. PRESTON, *Barns Garden, Cambridge*.

NOTES FROM A WOODLAND GARDEN

THE larger *Rhododendrons* are not a great feature in a woodland garden of strictly moderate area, and not only because of the precious space they demand. Unless carefully chosen, their colours are apt to be too dominating. With this in view *Pink Pearl* was not introduced without hesitation some years ago. Yet this now popular hybrid is a glorious sight standing almost alone against a background of Alders and the yellowy green of unfolding Ferns. Its splendid vigour is enough to warm the heart of any gardener and its colour is of the purest dye. Some of the self-white hybrids are distinctly pleasing, and—though this may be a matter of taste—a combination of *Sappho* and *Old Port* is very striking without being too gorgeous. A good word must also be said for the old *R. ponticum*. When you get it in a soft shade of lilac-purple (not mauve) few other shrubs of its kind are more delightful for shady woodland banks. The double-flowered *R. fastuosum flore plenum*, also a hearty grower, deserves the same recommendation as the last.

Among the mid-season *Azaleas* *A. altaclarensis* must always take high rank, its fine and fragrant trusses of deep yellow flushed with a subtle blend of orange and scarlet invariably affording a telling splash of warm colour which is never aggressive. Though one can hardly begin to differentiate in even a small collection of these handsome things, *A. Anthony Koster* must be mentioned as coming near to the above in quality and colour tone. The dainty *A. nudiflora* will also plead for notice, and one cannot pass unobserved *A. sinensis alba*. The *A. rustica* fl. pl. group also includes some very lovely varieties, delicate in hue, elegant in habit, and in every way suited to open woodland culture.

Though "rough" indeed were the winds that did "shake the darling buds of May"—to say nothing of the hailstones—there is at least one shrub that came through the ordeal without a stain, and that is the old white *Spanish Broom*. Not a spring goes by without one's admiration for this beautiful species being refreshed, and this season its silvery cascades have been especially enchanting. One group is peculiarly lovely at the time of writing, for a quantity of *Saxifraga umbrosa* (*London Pride*) that has spread over the bank it occupies covers the ground with a foam of delicate rosy whiteness into which the Brooms dip their sweeping sprays with the most delightful effect imaginable. Adjacent to this little "bit" there is a colony of *Ceanothus divaricatus* whose haze of luminous azure appears to add just that soupçon of colour which seems most desirable.

Another Broom towards which one bears unwilling allegiance is *Moonlight* (*C. scoparius sulphureus*), with large blossoms in a cool ivory yellow; a plant which, to my mind, is seen to best advantage as a single specimen against a dark green background. *C. racemosus* (*Genista fragrans*) is also at its best just now, a wonderfully beautiful species that can never be too well known, and though it is entirely in the open, it has braved the inclement weather with but little sign of injury. This credit must also be given to the charming *G. monspessulanus*, and another hardy doer here

is *Genista mautica*, which might be described as an early-flowering, semi-prostrate *Genista tinctoria*.

Though some consider it coarse, *Viburnum rhytidophyllum* is to my mind a first-rate open woodland shrub, the very large and crinkly leaves and fine, broad corymbs of creamy white flowers, combined with a rare stateliness of habit, together afford an effect that is distinctly noble and ornamental without being too exotic. Among the early *Spiræas* still in flower, *S. prunifolia* fl. pl. and *S. bracteata* are, perhaps, the best of their class, but it is not easy to pass the beauty of the young foliage of *S. opulifolia aurea*.

Beneath some of the above-mentioned *Azaleas* and others *Primula sikkinensis* has raised its elegant and mealy stems and tossed out the first of its citron-yellow bells. *PP. Wardii* and *Sieboldii* are also here, while in a rather more open spot the splendid *P. helodoxa* is opening the first of

THE MOONLIGHT BROOM, CYTISUS SCOPARIUS SULPHUREUS.

its yellow whorls. But even more arresting than any of these and others, not excluding the sumptuous *Ailin Aroon*, is *P. Cockburniana*, which bears on its mealy white stems circlets of little flowers in the most reticent of orange-scarlets.

In striking contrast to the last mentioned is a near-by group of the Rocky Mountain Columbine (*Aquilegia coerulea*), loveliest of its race, one of the first to open its clear blue flowers and the only one, in so far as my knowledge goes, that holds its flowers erect, gazing upwards at the sky. No Columbines are wanting in grace, but this one always appears to me to be the last word in that classic virtue. Very charming in quite another way and almost unique in the colour of its foliage is *A. formosa*, an ideal woodland plant. The gold that pervades the scarlet of its prettily poised blossoms was created by the god of gardens expressly to be associated with the peculiar yellow-green and ruddy fur of half-grown Male Ferns.

If it is hardly choice enough for the border, *Geranium Lowii* is a woodland plant of fine foliage. Though biennial, it seeds itself freely, and its red-purple flowers are among the earliest of its race to appear. Closely akin to our own *Herb Robert*, but much larger in all its parts and rather stiffer in habit than that wildling, *G. Lowii* makes amends for any failings it may possess by assuming most gorgeous autumn colours. Among other notable foliage plants just now are the *Thalictrums*, *TT. aquilegifolium* and the native minus being perhaps the prettiest. In this class, too, a plantation of *Solomon's Seal* under some *Hollies* must be considered one of the good old stand-bys, and then there are the *Euphorbias*, including some that are as pestilential in the wrong place as they are admirable in the right one. *EE. cyparissias* and *amygdaloides* belong to these latter outcasts. But *EE. polychroma* and *Myrsinites*, the latter a trailer preferring a more sunny spot than most, have so far not shewn any desire to offend. Among other shade-loving woodlanders which deserve

their meed of praise at this season are *Saxifraga Germ* and the old-fashioned "Borage" of cottage gardens. I refer not to the large-flowered, black-anthered species—probably native—but to the old bee garden *Anchusa* (*Alkanet*) *sempervirens*, whose blooms are smaller and rounder, the petals overlapping instead of being starred.

When the Wood Hyacinths are going off certain groups of American bulbous plants of a like character appear, and of these the blue *Brodias* are very delightful. *Camassia Cusickii* is also a stately thing, with a tuft of glaucous, strap-like leaves, above which stands the tall stem bearing a spike of lavender blue flowers. The old *Scilla peruviana*, which seems to be less common than formerly, is also a good plant for a free woodland soil, and the big, fuzzy heads of blue which just overtop the fleshy and abundant leafage are very handsome. This, however, is not a certain bloomer and here, at any rate, it needs an occasional breaking-up.

N. Wales.

A. T. JOHNSON.

GARDENING OF THE WEEK

FOR SOUTHERN GARDENS.

The Kitchen Garden.

Lettuce.—In hot dry weather it is often difficult to keep up a supply, but a good method is to transplant a reliable Cabbage variety in frames (discarding the lights) placed near the water tank. A layer of rotten manure should be laid in the bottom of the frame and then a few inches of old potting soil and, after a thorough watering, the plants should be set out a few inches apart. Shade them for a week or so when the sun is bright and keep the soil moist. A pinch of seed should be sown about every ten days.

Brussels Sprouts.—The main crop should be planted in a fairly rich soil which has been deeply dug and then made firm by treading. The plants should be set out 30 ins. apart and the roots must be afforded plenty of water until they take possession of the soil. Future treatment consists of a free use of the hoe and an occasional dusting of soot.

Potatoes.—Continue to hoe or lightly fork between the rows of late Potatoes. Earthing-up should begin directly the haulm is sufficiently advanced and when the soil is more or less moist. Avoid making sharp ridges that would drain off the rain.

Leeks.—Some of the seedlings will be large enough to transplant either in a trench or in rows. The former is made similar to a pea trench and the plants placed in a double line about 15 ins. apart. They may also be planted with a dibber. This is pushed well down into the soil, and the plants are set deeply in the hole with a little soil pressed lightly around the roots. As the plants grow the hole should be filled during the process of hoeing. Water will be needed if the soil is dry. Leeks enjoy a rich soil, but good quality roots may be had from any ordinary garden. When grown in lines they should be about 1 ft. apart.

Swedes.—These are highly appreciated in many houses, and now is a good time to sow a few lines about 18 ins. apart. Where Turnips are not a satisfactory crop, Swedes are strongly recommended, and when the seedlings are large enough they must be thinned to 6 ins. The turnip fly must be watched for, and as a preventive an occasional dusting of soot should be given.

The Flower Garden.

Wallflowers.—If not already done, seeds of these beautiful spring-flowering plants should be sown. Late sowing never produces such fine plants as those raised earlier.

Herbaceous Borders.—Hardy perennials will now require attention in regard to tying and staking, and the future appearance of the border depends upon how this work is carried out. The method of placing one stake in the centre and tying the plants to it faggot-wise should be avoided, and no doubt one of the best effects is produced by the judicious use of untrimmed pea-sticks. When placing the supports the maximum height of the plants must be taken into consideration, and then the growths will soon hide the sticks. The borders should be kept free from weeds, and where grass edges exist they should be periodically trimmed. Any vacant spaces should be filled with annuals, while clumps of Dahlias look well and give a good display later on.

Hardy Primulas.—These have been making an unusually fine show, and as the majority are best treated as biennials, it behoves the grower to save a little seed of every kind each year. Home-saved seed of hardy Primulas always germinates more freely than seeds from other sources, and it sown directly it is ripe plenty of plants will be secured. Prick them off in a shady part of the garden, and when they die down transfer them to their flowering quarters.

Climbing Plants.—Among the numerous climbers will be found the Clematises, Solanums, Wistarias, etc., and it is advisable to train the shoots at frequent intervals before they become a hopeless mass. Where they are growing on stumps of old trees they may develop unmolested.

Vegetables Under Glass.

Tomatoes.—A top-dressing of good soil will be beneficial to plants producing heavy crops, and if the plants are in pots and there is no more space for soil a light sprinkling of artificial manure may be given. Keep the roots well supplied with water, then there is less fear of the fruits splitting.

L. W. BRISCOE

Gardener to W. R. Lysaght, Esq.,
Castleford, Chipstead, Gloucestershire.

FOR NORTHERN GARDENS.

The Kitchen Garden.

Cabbages.—Spring-sown Cabbages should be planted as soon as possible, for if left long in the seed-bed they will get drawn and spindly, a condition from which they will never fully recover. On light soils the maggots of the cabbage fly often prove highly injurious to the crop. The following preventive has been found fairly effective: Make a puddle of loam, fresh cowdung, soot and water, and soak the roots of the plants in it immediately prior to planting. Allow 21 ins. between the lines and 18 ins. between the plants in the lines. If the soil is at all dry, water the plants individually as planting proceeds.

Cauliflowers.—Draw some earth to the crop planted out at the beginning of April. Plant the spring-sown crop, and the hints given above regarding Cabbage may also be acted upon for Cauliflower too, as the cabbage fly is even more partial to Cauliflowers than to Cabbage.

Brussels Sprouts.—Although spring sowing in the open is not to be commended, as the plants have, in our short summers, hardly time to develop fully; yet "better late than never," and Brussels Sprouts should be planted out in a sunny position without delay. Allow 2 ft. between the lines and 18 ins. between the plants in the line.

Potatoes.—Earth up the maincrop varieties as soon as they attain a height of from 6 ins. to 8 ins. A light dressing of prepared potato manure or of potash in some form sown alongside the stems prior to earthing up will materially benefit the crop.

Celeriac.—This vegetable is not very popular, but being so much easier of cultivation than its near relative Celery, and equally good for flavouring purposes, it is a good plan to grow a certain quantity of it for this purpose and thus save the stock of Celery to some extent. Those who possess it should plant now on the level on rich soil.

Angelica.—This native biennial is much prized by some when preserved and used in the same way as preserved ginger. It is related Celery, and may be used to save the Celery to a considerable extent. It should be planted out now in rich soil in lines 15 ins. apart with the plants 6 ins. apart in the row. It, of course, is planted on the flat and requires no blanching.

The Flower Garden.

Bedding-Out.—This work should be completed as soon as possible, as all risk of frost is now past. Begonias should receive a little extra attention by the application of an extra dressing of leaf-mould or stable manure to the soil. Any surplus bedding plants should be set out in the reserve garden to be available for making up such blanks as may occur.

Dahlias are gross feeders and demand liberal cultivation. Having fixed the stakes in position, a neat pit should be taken out with the spade close to each. A supply of a rich light compost should be at hand, and a spadeful of it given to each plant as it is placed in position. Planting finished, each Dahlia should be loosely tied to its stake, and the operation completed by forking over the whole of the spaces between the plants.

Fruits Under Glass.

Strawberries.—No time should now be lost in securing runners from which to raise plants for forcing next season. The runners should be taken from young plants, and may either be rooted in small pots filled with some light soil, or in small squares of clean fresh turf sunk, grassy side down, to the general level of the ground; the latter system is on the whole preferable. The turf or pot having been sunk under a vigorous embryo plant, the plant should be pegged down in correct position, and the growing point of the runner should then be pinched off immediately beyond it. If the weather prove dry, the whole should be watered by means of a can fitted with a turned-down rose. The plants should not be allowed to suffer for lack of water.

Orchard-House.—Frees will require attention as to watering and feeding until the fruits have attained full size. Ventilation should now be given without stint during both day and night. Wood is generally made sparingly under the conditions obtaining here, but any extra vigorous shoots should now be pruned back to within about 3 ins. of their base.

CHARLES COMFORT
Formerly Head-Gardener to Mrs. Hug, Bromfield, Davidson's Mans, Melbourn.

GREENHOUSE AND CONSERVATORY.

Roupala Pohlil (syn. *R. corcovadensis*).—Considering that this handsome foliage plant has been in cultivation for so many years, it is surprising that it is not more generally grown. This is probably due to the fact that this plant is commonly understood to require stove treatment. It will, however, stand quite well in any ordinary greenhouse. It is also a beautiful plant for room decoration, either in the small or large state, and not only does it stand in any ordinary living room, but it also grows quite freely. Grown on in large pots or tubs it makes fine specimens for the cool conservatory, or it may be planted out in a bed or border in a large house. This plant is by no means difficult to increase by means of cuttings. They are, however, very slow, taking at least six months to root. The cuttings are best inserted singly in small pots, plunging them in a close case with some bottom-heat.

Salvias grown for autumn and winter flowering should be potted on as they require it. *S. splendens* and some of its large-growing varieties make fine specimens for autumn and winter flowering in the conservatory. Some of the dwarf free-flowering forms—of which *Glory of Zurich* is a good type—are best for furnishing the stages, and by propagating successional batches may be had in flower almost all the year round. *Salvias* should be given liberal feeding when their pots are well filled with roots. They are subject to attacks by red spider, but this pest may be held in check by the free use of the syringe. The large specimen plants should be stood out in the open during the summer months. If the pots are partly plunged, it serves the double purpose of preventing them being blown over and also keeps the roots cool. Other *Salvias* suitable for autumn and winter flowering are *S. rutilans*, *S. rubescens*, *S. leucantha*, *S. involucrata* var. *Bethellii* and *S. Heerii*; while *S. Greggii* is a pretty sub-shrubby species, more or less hardy in warm light soils in the South, which makes a pretty and neat bushy plant for furnishing the greenhouse stages during the autumn. The blue-flowered *S. azurea grandiflora* should also be grown for autumn flowering. They all thrive under the conditions afforded Chrysanthemums. In the immediate neighbourhood of London their successful flowering is somewhat uncertain, as one night's fog is sufficient to ruin them.

Hippeastrums.—As the plants in the conservatory pass out of flower they should be returned to a warm house, plunging the pots in a bed of fibre with bottom-heat at command. They should be given every attention as regards feeding and watering so as to enable them to build up good flowering bulbs. Where a collection is kept up some seed should be sown each year as soon as it is ripe, growing the young plants steadily on without drying them off until they have attained flowering size. They may be grown on in pots or planted out in a raised bed with bottom-heat in a low-heated pit.

Richardia africana.—As the plants pass out of flower they should be planted out in a well manured trench for the summer months, giving them plenty of water during dry weather, as they are more or less aquatic plants. This is an excellent method of strengthening weak stocks. If desired, they may be left in their pots, standing them at the bottom of a wall for the summer, and during September they should be shaken out and repotted.

Petunias were at one time popular plants for the decoration of the conservatory, but are now seldom seen. This is rather surprising, as they may be had in flower from now onwards right through the summer and autumn. They are easily raised from seed, but any specially desired varieties should be increased by means of cuttings. All the numerous garden race are descended from the two species *P. integrifolia* (syn. *P. violacea*) and *P. nyctaginiflora*, both of them beautiful plants and worthy of more general cultivation. If so desired, some of the stronger-growing varieties will make fine large specimens, which are useful for standing in beds in the conservatory.

Celosias and Balsams.—Sow successional batches according to requirements. The former are best grown quickly in a brisk intermediate temperature, while the latter do best under perfectly cool conditions, the best being generally grown in cold frames. They should be given plenty of room, otherwise they soon become weak and drawn. When repotting, the stem should be well covered with soil; this induces them to develop fresh roots from the stem. When growing freely they enjoy plenty of feeding, with ample supplies of water.

DONARD NURSERY CO., Newcastle, Co. DOWN

First—from the first

WHEN the designing and building of Glass Houses became an industry—when purchasers realised that a Glass House was something more than a combination of glass, woodwork, and bricks—Duncan Tucker & Sons, Ltd., were the first to apply their practical building experience to the problem of efficient Glass House construction.

This was many years ago — since then Duncan Tucker & Sons, Ltd., have steadily progressed, and their structures are to be seen in every part of the country. In spite of increased competition they still hold the proud position of being the largest builders of Glass Houses in Great Britain. Whether you are contemplating the renovation of an existing Glass House, or the erection of a new one, this experience is yours for the asking.

Those contemplating the erection of a new Glass House are invited to send for a free copy of an illustrated Brochure entitled "The Charm of Perpetual Summer." This Book, handsomely illustrated from actual photographs, contains much useful information relating to the design of Glass Houses for specific purposes, and their upkeep.

HARDY WATER LILIES

Their Culture in Tubs, Tanks and Ponds

IN many gardens there are naturally-formed ponds in which collections of Water Lilies are grown. These Lilies are general favourites, and nearly every owner of a garden who sees them wishes to have a few. There need, of course, be no difficulty in growing the plants in ponds fed with a regular stream of water. Where such are not available, then artificial ponds or tanks must be substituted; and, on a much smaller scale, tubs partly sunk in the ground.

ESTABLISHING PLANTS IN A NATURALLY-FORMED POND.

The round pond may be made to look very charming with Water Lilies, but one with curving outlines and, perhaps, gently undulating edges and banks may be made still more effective. In the case of the first named especially, a judicious use should be made of suitable Water Rushes to break up the formal outline.

The first operation should be to make soundings near the edges and to mark, by inserting sticks in the mud, the best positions—those where the water varies in depth from 2ft. to 4ft. or so. If the mud is very soft and easily moved, drive in, about 1ft. apart, five stakes for each plant, leaving the ends 1ft. or so above the mud. These stakes will retain the loam for the roots of the plants, which should be sunk in large pieces until the latter are well established.

The plants must be gently sunk and placed in the centre of the prepared bed of loam, having first made them secure in suitable baskets filled with the following compost: Turfy loam, rotted leaves—oak or beech for preference—and coarse grit or sand. Of course, the compost must be placed round the roots of the plants firmly, but with care and, to prevent displacement, tie down both plants and soil to the basket itself. In due course these baskets will decay, but that matters not at all, as by that time the roots will be well established in the bed of prepared loam placed among the driven-in stakes.

Small, artificially constructed ponds must have a lining at least 9ins. thick of puddled clay. Such ponds are not at all expensive to make, and still less so where the surrounding soil is clayey, as then only the bottom need be of puddled clay.

A brick and cement tank is expensive to construct, but if the work be well done will last for many years. The accompanying sketches will make clearer to readers how the work of construction is done.

If possible, the tanks should be built in a place where there is a natural supply of water or where water-pipes can be laid.

In connexion with the tank, I also refer to the sunk tub shewn at No. 1, loam No. 2, basket containing the plant, No. 3. Two brick and cement tanks are shewn. One may be built, or a series with water running through from the first to the last. Nos. 4, 4, tanks; Nos. 5, 5, cement linings on the brick walls (Nos. 6, 6). Nos. 7, 7, shew how the water should pass from one tank to the other. No. 8, water entering in and running out at the opposite end.

THE SECTION OF THE TANK.

On a concrete base lay in cement a course of bricks on edge, No. 9. At No. 10 the inner cement lining is shewn thickened and rounded off at the bottom on both sides. Nos. 11, 11, shew the baskets firmly embedded in the layer of loam. To hold these baskets in position use a few loose

bricks and whole turves at the sides. The brick walls are shewn at Nos. 12, 12, and should be 9ins. thick, so that there will be no risk of cracking the cement lining, as might occur in the case of a wall of a single brick thickness.

The depths may vary in the different tanks, being 2ft. in one, 3ft. in another and 4ft. in a third.

WATER LILY TANKS IN PLAN AND SECTION.

This last depth is generally found sufficient for even the strongest growers. Both tubs and tanks should be, mainly, below the normal level of the surrounding ground. If the edge is 9ins. above, it will look well, and to do away with the bare and artificial appearance of such tanks, borders of suitable width may be formed round them and planted with moisture-loving plants or, indeed, with other kinds so that they may be furnished, leaving spaces so that one may approach near enough to inspect and enjoy the beauties of the Water Lilies. Hardy Ferns judiciously used make a feathery edging.

GEORGE GARNER.

[Many people dislike the appearance of cement, much preferring to see the brick or stone of the

tank walls. If the retaining walls are built with a 1 1/2 in. cavity and this is filled with a good cement grout as the work proceeds, the tank will be quite watertight.—E.B.]

THE SPRING-FLOWERING SEDUMS

IN a small collection there are not many sedums which can be included under the above heading, most species not flowering until full summer. Albeit, they are rather a choice little lot which are now in bloom, or just gone over. Foremost among them stands a good form of *S. spathulifolium purpureum* with rosettes some 2ins. across, the large leaves being almost a blood crimson and the small ones at the centre a cold, bluish white. From among these rises the mealy flower stem to about 5ins., when it breaks into a handsome head of bright, glistening yellow. In addition to this, one may get a gradation of sizes in this species, with a gradual fading of the red colour, down to somewhere near the type (if such a thing exists in a definite form) with its much smaller rosettes and little more than pale rosy-purple wintry tips to the glaucous leaves. Plain green *spathulifolium* there are also, and a pretty dove-coloured kind with very little purple, and a rather lilies-looking affair secured as *S. s. var. aureum*, which is the wan hue of a frosted lettuce. This, however, now coming into bloom, promises to be distinct.

* *S. ternatum*, a species of a much more fixed type than the preceding and still one of the best in cultivation, gives us bloom in April with untailing regularity. Unlike most of its kind it enjoys a fairly cool soil and the size of the blooms and beauty of growth depend a good deal upon this. *S. ternatum* has leaves of pale yellowish-green, broad and rounded at the apex, the flower stems ascending to about 1ms. and bearing a three or four-branched cyme of shimmering white stars, each of which are some 3/4 in. across. *S. Nevii*, another North American species, is allied to the foregoing, but it is smaller in all parts, the leaf rosettes are closer and more glaucous and the flower heads, though often more branched than those of *S. ternatum*, are about one half the size and of the same gleaming whiteness. *S. Nevii* flowers rather later than *ternatum* and both will cover a considerable space by rooting their offsets.

S. compressum, though not so hardy as those already mentioned, is a remarkably handsome species, with somewhat narrow, pointed, fresh green leaves. These have a tendency to turn red at the tips and the younger ones are finely toothed at the margins. This noble species makes an imposing clump about 8ins. in height, the flower-head appearing at this season on short, terminal, crimson stems and breaking into a blaze of orange yellow blossoms. These latter are much like those of *S. Palmeri*, an earlier bloomer now out of flower in the open here, and one that is easily distinguished from the above by its pale emerald, fleshy and blunt, or rounded, leaves.

Between *SS. prealtum* and *confusum* there is some similarity. The former is the tall, loose-habited, vivid green species, with leaves the shape of an Indian club, and which is common in cottage windows. This does not always flower in the open here and when it does so it is later than *confusum*, which is of lesser stature with blunter, shorter, fatter leaves which, as will those of the former, turn a bronzy hue in the open. The bright yellow blossoms appear in a very beautiful, branched, but rounded cluster at the tips of the semi-upright branches in early April and last for many weeks.

N. Wals.

A. T. J.

For Fruit Trees.—The latest gardening device introduced by the House and Garden Sundries Company, Limited, is their patent straining wire specially adapted for rapidly and easily securing Raspberry canes, Loganberries, fruit trees, etc., to horizontal wires. This is accomplished by the permanent attachment of pieces of thin soft wire at intervals usually 4 in. or 6 in. along the main wire, so arranged as to leave the two ends free, which can then be brought together round the cane, etc., and with one twist of the fingers be quickly joined, thus securely holding the plant to the main wire. The operation is accomplished in less than half the time occupied in the old manner (*i.e.*, by tying afresh each year a piece of bast, string or other material), and as the wires are galvanised a great saving not only in expense but in time is effected; moreover, as the wires cannot slip along the main wire, the Raspberry canes, etc., are securely held in position. It should be specially observed that the tying wire is so soft as to be easily bent by the fingers, and no tools are required. We are illustrating herewith their very excellent arrangement for

suspending, netting or other protective material to shield fruit trees against a wall. The galvanised brackets are light, strong, rustproof and not conspicuous, and ordinary bamboo canes answer capably for the rods which actually carry the curtains.

Notice to Exhibitors at Chelsea.—We have received from the Secretary of the Royal Horticultural Society the following: "I am requested by the Council of this Society to draw your attention to the fact that we are only able to exclude the public from the grounds of Chelsea Hospital until 7 p.m. on the evening of Saturday, June 2. Until that hour we are endeavouring to give all possible protection to our exhibitors and their possessions that the police can ensure; but the police will not undertake to guard anything left in the grounds after that time and, as the public have free access to the Gardens, you will understand that we are powerless in the matter. Exhibitors must, therefore, take steps either to remove their exhibits before 7 p.m. on Saturday, June 2, or to have them effectively guarded."

Royal Gardeners' Orphan Fund.—The annual festival dinner of the Royal Gardeners' Orphan Fund was held on Friday, May 18, at the Hotel Victoria, Northumberland Avenue, W.C. Mr. George Moore presided over a representative attendance of about 100 ladies and gentlemen. The chairman pleaded the claims of the orphans very eloquently, and he was ably seconded by the treasurer, Mr. J. E. N. Sherwood, and Mr. Leonard G. Sutton. Mr. Sherwood made a strong appeal for the restoration of the reserve fund to its previous strength. He stated that a sum of £1,050, in addition to the annual outgoings, would be necessary to enable this to be done. Mr. G. F. Tinley, who, in the absence of the secretary, Mr. Brian White, had very kindly undertaken the secretarial duties, afterwards read out the donations forthwith in response to Mr. Moore's appeal, amounting in all to upwards of £1,200. The chairman's list amounted to £158, including

sums collected in Covent Garden Market by Mr. David Ingamells amounting to £175. Messrs. Hurst and Son gave £100; Mr. F. C. Stoop, £100; Messrs. Sutton and Sons, £50. Mr. J. M. Bridgeford's list amounted to 50 guineas; Mr. W. Nutting's list to £50 6s.; Mr. H. J. Jones' list to £43; Mr. G. F. Tinley's list to £25 15s. 6d.; Mr. F. J. McLeod's list to £25; Mr. J. E. Dixon's list to £23; Mr. D. Swain's list to £14 18s.; Mr. W. Howe's list to £14 3s.; and £10 10s. each were given by Sir E. Stern, Bart., Sir J. Colman, Bart., Mrs. Campbell, Messrs. Corry and Co., Mr. R. Corry, Messrs. Barr and Sons, Mr. C. R. King and Mr. E. Mainwaring. Mr. G. Reynolds' list amounted to £7 4s. The principal amount in the chairman's list was his own donation of £100. Other items were Mrs. G. Monro, sen., £10; Mr. A. J. Monro, £5 5s.; Mr. E. Monro, £5 5s.; Messrs. E. Stevens, R. Rochford, D. Ingamells, H. Larsen, J. Cull, H. Miles and J. Miles, each £10 10s.; Mr. W. Robins, £8 8s.; Mr. Daniels, £6 0s.; and Lord Lambourne, £5. Considering the times, the result must be regarded as satisfactory, but a great deal more support should really be afforded to this very deserving charity. The present rate of allotment, 5s. per week per child for not more than two children in one family, is really inadequate, being, indeed, on the pre-war scale.

FORTHCOMING EVENTS.

June 5.—Royal Caledonian Horticultural Society's Meeting.

June 6.—Lewes Horticultural Society's Meeting.

June 7.—Manchester and North of England Orchid Society's Meeting.

ANSWERS TO CORRESPONDENTS

FLOWER GARDEN.

SOWING SEED OF PÆONIA MOUTAN (W. R. J.).—The seed should be sown as fresh as possible. Sow in pans or pots of sandy loam, well drained, and as the seeds are large, cover them to the depth of quite half an inch. If heat is available they will germinate more quickly, but sometimes Peony seeds take a year or more to come up, especially if old and dry.

LILY OF THE VALLEY UNSATISFACTORY (C. M.).—These plants flowered very freely, generally, last year. Probably this weakened them and is the main cause of paucity of bloom this year. When the foliage has faded naturally, carefully clean the surface of the bed and apply a mulch of rotted leaf-soil. We have grown a quarter of an acre of these Lilies in good kitchen garden soil on north-west and north-east borders and found the plants spread rapidly even under the paths, being stronger at the edge and weaker at the centre of the bed. Lift, grade and replant some of the crowns next February in the sites referred to above. Remove the top 12 ins. of soil, put in sandy soil and leaf-soil or half-rotted leaves. Plant 4 ins. apart and cover the crowns 2 ins. deep. Water through a rosed watering can afterwards and during the following summer in very dry weather.

TREATMENT OF LILIES (D. McD.).—Our correspondent does not say what kind of disease the Bordeaux Mixture is to be used for. If the Lilies are healthy, do not spray at all; if they are attacked by the fungus *Ocularia elliptica* use the mixture, but not after the buds are formed. Its budding would, of course, tend to strengthen those retained; the second year there should be no need to disbud, the plants being much stronger. Two to three inches of soil will be sufficient to place on the one and two year old bulbs respectively.

GERMAN IRISES (Felted).—These Irises will grow in almost any position when they are nicely established. To accomplish this in our correspondent's case the best course would be to remove the turf to a width of 1 ft., take out the soil to a similar depth, put in sufficient rotted manure to half fill the trench, replace the other portion of soil and plant the Irises in such a way that their roots do not actually come into contact with the manure. A space about 6 ins. wide round the plants themselves should be left at this stage, free from grass. As the Irises grow the grass will, too, but not to the detriment of the plants in future years.

CHIONODOXA SEEDS AND PLANTING (R. S.).—Some of the seed pods should be gathered as close together as possible, without detaching them from their stalks, and placed on scrim netting or similar material, or even on tiles, slates or boards; the seeds will not then be lost. Directly the stalk ends next to the seed pods have withered, gather the pods and finish the ripening on brown paper placed in a cool, airy shed. The seeds may be sown in a sandy soil in August or September. It will be several years before the resultant plants flower freely, the odd, strongest ones sooner than the others.

VARIOUS QUESTIONS (L. M.).—The soil for Madonna Lilies should be light, well manured and allowed to remain for several weeks prior to the planting of the bulbs. In some soils these Lilies do not succeed with good treatment; possibly they will flower better the second year. Slugs probably have eaten holes in the leaves. The *Trillium* thrive best in a naturally moist soil, but not in stagnant, undrained soils. The plants may improve when the warm weather comes. The double-flowered *Arabis* may be raised from seeds sown in a cold frame in August, or from cuttings inserted in sandy soil in a shaded border during the early part of summer. Owing to the cold weather and soil the *Laburnum* has, most likely, not made many new roots and so new growth would be checked. Surface mulch with manure and lumpy loam, mixed. The *Polyanthuses* will do well in a shaded or north border if the roots of shrubs do not enter the soil. Sun heat is detrimental to these plants. In the moist soil the following plants would succeed: Water Flag Iris, Marsh Marigold, Funkias, Spiræas, *Myosotis*, *Primulas* (hardy), *Senecio Chrysanthemum*, *Solidagos* and hardy Ferns. These will, perhaps, be sufficient for our correspondent's purpose.

LET THEM ALONE AND YOU WILL REGRET IT.

Green Fly and other Aphides, Psylla, Mealy Bug, Thrips, Red Spider increase with alarming rapidity if left unchecked.

GIVE "GYP" THE NON-POISONOUS 'EM

and you will be surprised at the prompt results—the insect pests are destroyed and the foliage regains a clean and healthy appearance. Gyp is easy to mix and is perfectly safe.

Obtainable in tins at 1/3 from Grocers and Seedsmen, or in Quart tins at 3/- each, post paid, direct from Manufacturers,

NOW READY.

FURNISHING THE HOUSE

A Book full of Suggestions for Furnishing Every Room in the House from Kitchen to Attic.

By R. RANDAL PHILLIPS and ELLEN WOOLRICH

(Editors of "Our Homes and Gardens.")

Quarto, with nearly 150 illustrations, showing a variety of treatments for houses of moderate size.

10/6 net. By post 1/- extra.

An Illustrated Prospectus of this helpful book will be sent post free on application to The Manager, "COUNTRY LIFE," LTD., 20, Tavistock Street, Covent Garden, W.C.2.

ARE YOU WITHOUT A SERVANT?

THEN READ

The Servantless House and How to Equip it.

By R. RANDAL PHILLIPS

A thoroughly practical book by the Editor of "Our Homes and Gardens," showing especially what can be done in existing houses to secure the greatest comfort in the most economical way.

Large 8vo., full of illustrations, 6s. net.

By post 6s. 6d.

A prospectus of this book will be sent post free on application to the Manager, "Country Life," Ltd., 20, Tavistock Street, Covent Garden, London, W.C.2.

The most efficient Mower on Earth

DURING the mowing Seasons of 1921-22-23 the British public invested £262,500 in the purchase of 3,500 "ATCO" Motor Mowers. Prior to that period the majority of mowing was done by hand or horse mowers at a cost per annum sufficient to pay for an "ATCO" outright. Of these 3,500 "ATCO" owners not one, to our knowledge, has met with a mowing difficulty to which the "ATCO" is not equal.

THE "ATCO" LAWN EDGE TRIMMER

works with great speed and simplicity, giving a straight edge by the actual continuous "shears" action. Its efficiency and reliability have been perfected in actual use under all normal conditions.

PRICE:
57/6
delivered.

One owner writes that mowing which employed a gardener two full days is now done more efficiently in five hours with the "ATCO." At Cheddle Hulme an "ATCO" has just completed its second season without a single breakdown and without the owner having to spend a penny piece. A gardener with sufficient mowing to occupy a man and a boy six days with a push mower, now does the whole of his work in two days on less than a gallon of Petrol Mixture.

Send for Free Booklet offering FREE DEMONSTRATION on your own grass, and telling how the "ATCO" pays for itself in a year.

PRICES: 16 in. £50. 22 in. £75. 30 in. £95.
Less 5% Cash, 7 days. Cultivator extra.

By C. H. J. CLAYTON, M.S.E., A.M.I. Mech.E.
Chief Drainage Engineer to the Board of Agriculture and Fisheries.

Crown 8vo, Illustrated. 6/- net. By post 6/6

A full prospectus of this important work post free on application to the Manager, "Country Life," Ltd., 20, Tavistock Street, Covent Garden, W.C.2.

LILIIUM CANDIDUM (L. M. G.)—No; the *Lilies* do not require lime nor lime rubbish. They succeed well if planted in September as follows. Make holes about 1 ft. deep, place well rotted manure in the bottom, fill up with good loam 3 ins. deep, mix soil and manure in the bottom 6 ins. only; place three or four bulbs on the soil and cover quite 3 ins. deep with good loam only. *Liliums* usually succeed where *Azaleas* and *Rhododendrons* do.

TREES AND SHRUBS.

BLIGHT ON FIRS AND PINES (E. F. W., S. Croydon).—The blight on the Douglas Firs and Scots Pine is not identical with American blight, but is in all likelihood due to species of *Chermes*, though not the same species on the two plants probably. The best method of dealing with it is to spray the plants with nicotine wash (6oz. nicotine, 4lb. soft soap, 40 gallons water). These insects usually pass a part of their life on some other conifer, such as Spruce or Larch, and though the results of their attack are not immediately apparent, yet damage done is cumulative and if young plants are attacked no pains should be spared to rid the plants of the pest. It would scarcely pay to attempt the spraying of large trees.

WILD GARDEN.

HOW TO INCREASE BLUEBELLS IN WOODS (M. H. S.).—When the bulbs are matured in July and before any new growth commences, lift as many as are required and simply re-plant in the various positions marked beforehand for them. They will grow under all common woodland trees, including the Beech. However, in the case of large specimens it would be unwise to plant within 10 ft. or so from the trunk or under other large trees possessing spreading branches rather close to the ground. First loosen the soil, remove coarse grasses and weeds and then from August to October, plant, burying the bulbs 2 ins. deep.

KITCHEN GARDEN.

CELERY UNSATISFACTORY (C. Argyle).—Our correspondent's soil is probably sour and needs liming. The little white insects are springtails and as a general rule they flourish under sour soil conditions. Where particular plants need protection the use of naphthalene forked into the soil near the plants is desirable.

TO PREVENT PHEASANTS AND WOOD PIGEONS EATING GREENS (A. E. M., Haslemere).—Our correspondent should make a fence of fine wire or tarred string, stretching it lengthwise and crosswise about 1 ft. above the plants. Wood pigeons are very suspicious birds and are easily scared. A rag dummy resembling a man, laid down between the rows of plants will also answer. Sprinkle old soot on the leaves while the latter are moist. The dummy man should be placed in different positions several times during a week.

MISCELLANEOUS.

WEED IN POND (Mrs. C. Atherton).—Assuming the average width, length and depth supplied by our correspondent, the quantity of copper sulphate required to treat the pond will be 6 lb. The amount needed is 2 1/2 oz. to 10,000 gallons of water.

GRUBS IN SOIL (Torquay).—The grubs are not recognizable in the present stage, but are probably those of a fly which feeds upon decaying vegetable matter. The safest plan would be to bake the soil in a pan in the kitchen oven before use in potting.

VARIOUS QUESTIONS (C.).—The Apricot tree lacks lime in the soil; apply 1 peck next autumn, after removing the old surface soil down to the roots, mixing the lime with 3 bushels of fibrous loam. The Peach branches are suffering from silverleaf rather badly. Cut out these branches near the stem now, and dress the cut ends with tar. In October apply soot and water mixed to the consistency of mortar, 1 lb. thick, as a top-dressing and water it in; repeat similar dressings during the winter. Do not cut branches on this tree and then use the knife on other trees. Certainly, lifting and replanting will benefit the trees; also surface dressings of light compost; well drained soil is essential. The cutting of the leaves when green would do much damage, weakening the plants considerably. The Tulips in the rock garden may be lifted and duly replanted in fresh soil, but with good treatment they will flower well for many years in the same place, undisturbed. The Gentians should flower freely; *G. acutis* does well in ordinary soil with sand and gravel added. As the plants are healthy we do not know the reason why flowers are scarce, unless the plants are unduly shaded.

NAMES OF PLANTS.—J. P., Devon.—1, *Lithospermum purpureo-coccineum*; 2, *Cerastium montanum*; 3, *Carex Fraseri*.

English Columbines. There is much that might be said on behalf of many of the best forms of *Aquilegia vulgaris*, our short-spurred native *Columbine*. In elegance of growth and beauty of foliage they have few rivals, and while some of them can well hold their own in the borders, they are admirably suited for the woodland and the margins of shady, shrubby paths. Perhaps the most lovely of all is the large-flowered pure white form known as *Munstead White*, or *A. nivea grandiflora*, and this one appears to possess the exceptional merit of coming true from its own self-sown seed. It is perfectly robust and perennial and the pale, pea-green foliage is distinctive. There is also a good blue, not quite so permanent in type as the foregoing, but a large-flowered *Aquilegia* of pure colour which is well worthy of culture anywhere. Some of the pale, wine-tinted forms are very attractive, and between these and the deep claret there is a host of intermediate kinds. By ruthlessly eradicating indifferent colours and all with small double flowers it is an easy matter to maintain a good stock of these handsome plants for many years.

A Gorgeous Dwarf Shrub.—The name of *Pentstemon Davidsoni*, or *P. rupicola*, will not be forgotten by anyone who has once seen this wonderful little shrublet in full bloom. Though an inconspicuous plant, with small, rather dull green leaves clothing its prostrate branches, *P. Davidsoni* breaks into flowers of the most amazing brilliance towards the end of May. In the bud these blossoms are a clear and vivid ruby, but when the flowers open and expand into fat and enormous bugles of a most intense blend of herce carmine and red-mauve these, both in dimensions and colour, seem strangely out of proportion to the size of the plant. *P. Davidsoni* is not difficult to grow on any sunny ledge of well drained soil. If it is rather impatient of winter dampness, it is so easily propagated by cuttings in full summer that one may always hold over a reserve stock in a cold frame.

The Prickly Thrifts.—The genus *Acantholimon* comprises a select number of little plants, the majority of which are first-rate for any dry, well drained soil in full sun. Many are high alpine, though close allies of the Sea Lavenders, and while being perfectly hardy they do not so strongly object to our damp winters as some of their mountain companions. Others inhabit arid, sun-burned regions, but these are not less amenable to cultivation than the others. The Prickly Thrifts are characterised by their lowly, cushiony habit of growth, narrow spiny foliage, usually a greyish green, and by the chaffy bracts which enclose each blossom. Perhaps the best known is *A. glunaceum*, a vigorous grower and quite one of the easiest, which covers its low mound of foliage with pale pink flowers in the early summer. An even more taking species is *A. venustum*, with broader, less spiny foliage which suggests that of some *Dianthus*. In this one the flowers are larger and of a clearer rose pink, and the stems which bear them stand well above the foliage to a height of about 6 ins. In addition to these is a score or more which are still uncommon in cultivation, and though they may differ in the size and compactness of their cushions, a family likeness pervades the race and the flowers do not vary between pink and white. The *Acantholimon*s are lime-lovers as well as sun-worshippers.

Wistaria multijuga is one of the finest and most beautiful climbers ever introduced; the white variety of the Japanese *Wistaria*, although a comparatively new-comer, is now spreading rapidly in gardens. Like the typical purple-flowered form, it is one of those plants which no garden of any pretensions can afford to be without. Both are very hardy, quick growers, flower

profusely, and are not at all fastidious as to soil. If required they may be made to cover a large space, or, by pruning, may be kept within strict limit—even to those of a small shrub. The racemes do not appear to become quite so long as those of the purple-flowered *Wistaria multijuga*, which occasionally approach 4 feet in length. A convenient way of propagating both these *Wistarias* is to get pieces of their roots about as thick as a slate pencil and 2 inches to 3 inches long, and to graft on them pieces of stem of about the same thickness. The united scion and stock are then potted deep enough to almost bury the root beneath the soil, and put in gentle heat. If this operation be done in March, the young plants will make growths several feet long during the first summer.

Escallonia langleyensis.—Raised in the Langley nurseries of Messrs. Veitch about 1893, by crossing *Escallonia Philippiana* with *E. punctata*, this shrub must be counted among the great successes achieved by hybridisation in hardy trees and shrubs. Although one of its parents (*E. Philippiana*) is deciduous, the hybrid is evergreen. It makes long, arching, graceful shoots during the summer, which in the following season push forth a short twig from every bud. Each twig is packed with blossom. The flowers are half an inch in diameter, and of a charmingly bright rosy carmine. At its gayest during June and July, it continues blossoming into the two following months.

"Open Air."—The first number of *Open Air*, a new and beautifully illustrated magazine, devoted to the wonders of Nature and the joys of outdoor life, is published at a time when the thoughts of all are of the country and desires strong for the healthy pleasures and pastimes which can be enjoyed in the open air. There has long been a very definite need for such a magazine as *Open Air*, for the public to which it will make a strong and permanent appeal has increased enormously since the war. Because the love and pride in our beautiful countryside is common to every class of the community, the interest in the great romance of Nature deep and widespread, and the desire to participate in all forms of outdoor life and pastimes a national characteristic the success of *Open Air* would seem to be assured. Although *Open Air* makes its main appeal to those who work in cities and towns and can only go to the country occasionally, it will be read with interest and delight by everyone. This first number contains many interesting articles and its illustrations are very striking. For the walker there is an original article, "Tramping with Tess," in which the writer describes a tour of the places mentioned in Mr. Thomas Hardy's famous novel. The lover of Nature will delight in Miss E. L. Turner's description of the life and habits of the kingfisher, and in a beautifully illustrated article on wild flowers. Mr. Charles Hierons, the famous professional at Queen's Club, tells the reader how to win at tennis; Mr. Ward Muir is at his best in an article on trout fishing for the man of moderate means. How the clouds can be of service to all as weather prophets is described by Dr. Worsley Baker, and the beauties of Box Hill are made very real by Mr. C. Hussey. Mr. Rex Brittain takes the motor cyclist on a tour through Devon; and there is a very helpful article on what can be done with the light car off the beaten track. Articles on the Norfolk Broads, Light-weight Camping, Walking with Dogs, and pages for the outdoor girl help to make a most fascinating number. *Open Air* is published by the proprietors of *Country Life*, which is in itself a guarantee that the high standard set in this first number will be maintained.

THE PRIMULAS OF EUROPE

With Botanical Classification, Descriptions, and
Cultural Instructions

By **JOHN MACWATT, M.B.**

Crown 8vo., Cloth, 12/6 net; Postage 9d. extra.

The aim of the author has been to produce a handbook that will assist in the identification of those species of the genus *Primula* which are native to the European continent, and at the same time furnish practical guidance to the cultivation of such of them as have been introduced to our gardens where conditions differ so widely from those prevailing in their natural habitats.

Dr. MACWATT is an acknowledged authority on Primulas, and his book presents in a concise and interesting manner the results of many years of close personal observation and experience.

Published at the Offices of "COUNTRY LIFE," LTD.,
20, Tavistock St., Covent Garden, London, W.C.2.

NOW READY.

An important addition to the
"Increased Productivity Series"

First Advice to

Would-be Farmers

THE Book for Allotment-Holders
and Smallholders

By **F. E. GREEN.**

Crown 8vo. 5s. net; by post 5s. 6d.

THIS book throws a flood of light upon those things which everybody wants to know before farming even a few acres. The author discusses sites and markets, the most profitable kinds of Small Farming and the practicability of side-lines and trades created by the new conditions. It is a book of absorbing interest and enormous help to all who wish to make a living from the Land.

"The Garden Beautiful"

No garden can be truly beautiful where the plants are sickly and starved. Therefore dress it well with Nitrate of Soda, in conjunction with Phosphates and Potash.

Write for special pamphlets, entitled, "Successful Gardens for Every Amateur," "The Manuring of Orchards and Fruit Trees," supplied gratis and post free by **THE CHILEAN NITRATE COMPANY**, Friars House, New Broad Street, London, E.C. 2.

Nitrate of Soda

It's a great feeling—

to have worked hard on the garden and to be covered from head to foot with it! The soil seems to fit as comfortably as a suit of old clothes.

But there's something better still—to be pleasantly clean again when the job is finished. If the signs of honest toil stay on too long they get into the pores of the skin and you feel "stuffy."

KIT will get them out. And not only dirt as thick as you please, but the heaviest blobs of paint, grease or tar. KIT is the magic mover of all things that stick to the skin—the rub-and-a-wipe-and-it's-over soap.

The "PERFECTOR" ARCH forms an ideal setting for the Rose Garden. The
man whose pride is in his Garden will appreciate the simplicity and effectiveness of
this design. The construction is light, yet strong enough for a permanency, being
specially designed for the cultivation of climbing Roses, Clematis, etc. It is made
entirely of OAK and treated with Solignum, size 7 ft. high above ground level, and
3 ft. 4 in. wide inside. Price £1 each. Orders for three or more will be sent
Carriage Paid. Cash with order. These can be made wider than 3 ft. 4 in. if
required, prices for which will be quoted on application, stating number required.

THE

"PERFECTOR" PERGOLA.

This is constructed with the above Arches spaced
any distance up to 6 ft. apart. The longitudinal and
secondary cross bars to complete the Pergola are
supplied in OAK, treated with Solignum, at 1/6 per
foot run of Pergola; any lengths to suit your require-
ments. Thus the price of the Pergola illustrated
25 ft. long, works out as follows:—

4 Arches at £1 each	£4 0 0
25 ft. run Top Bar at 1/6	£1 17 6

CARRIAGE PAID .. £5 17 6

Notes from Maidstone

STANDARD ROSES.

For the grower of Roses, May is a month of anxiety. Our standards made unusually early growth and a severe frost would have played havoc with them. The fates, however, were kind, and we can now rely upon a very fine bed of standards all on English Briar—and not Rugosa—a point which needs no emphasis to the wise rose grower.

George Bunyard & Co., Ltd.,

[JUNE 9, 1923.]

THE SHRUBBY SPIRÆAS AND THEIR CULTURE

THE genus *Spiræa* contains some sixty to seventy bushy or shrubby species and a very considerable number of varieties. For garden decoration, however, twelve, or in extensive shrubbery borders and pleasure grounds twenty to twenty-five, species or varieties would provide a representative collection. They vary in height from the 6 ins. to 9 ins. of *S. decumbens* (procumbens) to the 25 ft. to 30 ft. of *S. arborea* and *S. Lindleyana*. Few families of shrubs provide such a lengthy season of flowering, which extends from March to October. I can only think of one at the moment, the genus *Rhododendron*. The *Spiræas* are natives of Europe, North America and North Asia. A large number have white blossoms, and, mostly among the summer and autumn flowering kinds, those with pink and red blossoms are beautiful.

Obviously, shrubs which vary so much in stature and produce such a profusion of blossoms should be extensively planted not only in the borders and as single lawn specimens, but in large groups and masses in the pleasure grounds and on the boundaries of woodland. Some of the *Spiræas* are also admirably adapted for waterside planting.

The cultivation of *Spiræas* presents no problems, and for this reason we seldom see their full beauty. The first desirable items are an open position and a loamy soil inclined to be moist rather than dry and sandy. This, however, is not all. In the fruit garden we trench and manure the ground for Gooseberry and Currant bushes, giving them also an occasional mulch of decayed manure. The shrubby *Spiræas* revel in such treatment, making plenty of

young growths, which are the heralds of an abundance of blossoms. If, in eight or ten years after planting, the bushes shew any signs of weakening, lift them and trench the ground—planting a fresh stock, or the healthiest pieces from the clumps lifted.

PROPAGATION.

The rapid increase of *Spiræas* is possible by seeds, cuttings, division of the clumps and, in some cases, by suckers; while the *Sorbaria* or pinnate-leaved group, as represented by *S. Lindleyana*, is readily propagated by cuttings made of the thick fleshy roots. The leafy cuttings made of moderately firm young shoots in July root readily in a propagating case, preferably with a little bottom-heat. More mature growth can be inserted outside and covered with a hand-light in September, while

fully ripened wood of some *Spiræas* will root if inserted in the open during October and November.

PRUNING.

Scarcely too much stress can be laid on the importance of pruning *Spiræas*. Broadly speaking, they divide naturally into two large groups for purposes of pruning: (a) those which flower in spring on the growths of the previous year and (b) those which flower in summer and autumn on the current season's growths.

The correct treatment for group (a) is to thin out the older wood and weak twigs as soon as the blossoms shatter. This serves to encourage vigorous new growth at once. If through any cause the bushes become tall and straggly, sacrifice a season's flowering and cut the shoots hard back in March. To this group belong *S. arguta*, *S.*

Thunbergii, *S. Veitchii* and *S. prunifolia* flore pleno. Group (b) is best pruned in February or March. First remove old wood and weak shoots which can be entirely dispensed with, shortening back the remaining vigorous wood so that the resultant young shoots form shapely bushes. Examples of this method of pruning include *S. Lindleyana*, *S. japonica*, *S. salicifolia* and *S. Margarita*.

A SELECTION.

While it may not be an easy matter to select a best dozen with such a wealth of species and varieties available, those chosen very well represent their wide variation in habit and season of flowering.

S. AITCHISONI, a vigorous bush up to 12 ft. or more in height, produces in July and August large branching panicles of white blossoms. It is a native of Afghanistan and Kashmir.

MILK WHITE PLUMES OF SPIRÆA LINDLEYANA.

A YOUNG TREE OF SPIRÆA ARGUTA.

THE GRACEFUL SPIRÆA DISCOLOR—BETTER KNOWN AS ARIEFFOLIA.

S. ARGUTA is an elegant small-leaved and very twiggy bush up to 7ft. or 8ft. high, producing during April and early May a wealth of white blossoms. It is rivalled by few and surpassed by none in its freedom of flowering in successive years. It is a hybrid, the reputed parents being *S. Humberti*, *crenata* and *hypericifolia*.

S. BELLA, a shrub up to 6ft. or 8ft. high, must find a place in the first dozen because it has bright rose coloured blossoms in May and June. A native of the Himalayas.

S. DISCOLOR (*ariaefolia*) forms a large bush up to 10ft. or 12ft. high, sometimes even more, giving a wealth of creamy white blossoms during July. This species comes from Western North America.

S. JAPONICA ANTHONY WATERER is a dwarf free-flowering *Spiraea* generally about 2ft. high, which originated as a sport from the variety *Bumalda* in Knap Hill Nursery in the early 'nineties. It produces a succession of rich carmine-red blossoms from July to October. *S. japonica alba* is a valuable white variety flowering in late summer and autumn.

SPIRÆA ARBOREA GRANDIS, WHICH IS EARLIER TO FLOWER THAN *S. LINDLEYANA*.

S. MENZIESII TRIUMPHANS.—In many ways this is the most beautiful of all the tall *Spiræas* with coloured blossoms. From 4ft. to 6ft. high, according to the amount of pruning given, it produces vigorous growths terminating in rosy red blossoms from July to September or October.

S. PRUNIFOLIA EL. PL.—A free-growing bush up to 6ft. or 5ft. high, with long, arching stems wreathed in double white blossoms towards the end of April and the first half of May.

S. THUNBERGII. This Chinese *Spiræa* is the first to blossom in our gardens, opening its small pure white flowers in March and April. The twiggy dense bushes are about 4ft. high.

S. SALICIFOLIA PANICULATA is a good form of the Willow-leaved *Spiræa* or Bridewort, producing a wealth of pink-tinted blossoms from July onwards. It grows some 4ft. to 6ft. high and spreads freely over the ground by means of suckers.

S. VAN HOUTTEI. A hybrid between *S. trilobata* and *S. cantoniensis*, of French origin. It produces a wealth of white blossoms in May and early June. Cultivated in pots and forced into flower early for greenhouse decoration, it is more valued even than *S. arguta*. Its average height is 4ft. to 6ft.

S. VEITCHII.—This Chinese *Spiræa* was first introduced to cultivation by Mr. E. H. Wilson in 1900. It makes a vigorous bush 8ft. or 10ft. high, perhaps more with age. When clothed with corymbs of white blossoms in late May and early June few *Spiræas* are deserving of more attention for massing in lawn beds and borders.

Should those named not be a sufficiently extensive list for large gardens, the following will extend the list to twenty: *S. brachybotrys*, *S. bracteata*, *S. canescens*, *S. Douglasii*, *S. Henryi*, *S. japonica*

ruberrima, *S. Lindleyana* and *S. Margaritæ*. The two shrubby *Spiræas* best suited for the rock garden are *S. bullata* from Japan, producing rosy red blossoms in July and August and the Tyrolean *Spiræa decumbens* (*procumbens*) with dainty white blossoms.

One of the rarest and most interesting species is *S. Millefolium*, a native of Western North America. From this locality it obviously should be given a sunny position and a well drained soil. The white flowers open in July. A. O.

THE SHOOTING STARS

THE genus *Dodecatheon* belongs to the *Primula* family, and is confined to Western North America, although one or two species are found in North-Eastern Asia by the Behring

Straits. According to the latest monograph of the genus by Pax, there are some thirty species, but they resemble each other so much that Gray, in the North American flora, treats them all as varieties of *D. Meadia*. They are all hardy herbaceous perennials, with tufts of oblong spatulate leaves of varying shapes and sizes, and scapes bearing umbels of drooping flowers on long pedicels. The petals are long and narrow and reflexed like those of the *Cyclamen*. They are usually found in moist, shady positions, and are well adapted for the sheltered parts of the rock garden or shady border. The soil they prefer is a loamy one, rich in humus, with plenty of moisture in the growing season. Nearly all the different kinds are easily propagated by division of the crowns after the leaves have ripened off, or the operation may be performed in early spring. The following have been, or are, in cultivation:

D. CLEVELANDI, a native of California, has short obovate leaves and umbels of three to five white flowers with a yellow base.

D. ELLIPTICUM (syn. *D. integrifolium*).—This pretty little plant is a native of the Rocky Mountains, where it is found in moist, open woods. It has narrow spatulate leaves, quite entire, from which, early in May, are produced scapes 1ft. or more high, bearing umbels of eight to ten flowers. These vary from rosy purple to pale lilac, and have a white base with a yellow ring.

D. FRIGIDUM (syns. *D. Meadia* var. *splendidum* and *D. Jeffreyi* var. *alpinum*).—This elegant plant is found further north than any of the others, its habitat extending to the Behring Straits in the Arctic circle from the coast ranges of Western North America. There it abounds

on mountain slopes, rocky places and stony, often saline plains, ascending up to 7,000ft. elevation. In colour the flowers vary from rosy purple to nearly white, and have a dark rosy purple

A BEAUTIFUL AND FREE-FLOWERING SHOOTING STAR,
DODECATHEON RADICUM.

ring of spots at the base. They are borne in umbels of from two to four from a rosette of narrow lanceolate leaves in May.

D. HENDERSONI comes from Sierra Nevada and California, and has, in May, dark purple flowers with a yellow base.

D. JEFFREYI (syn. *D. Meadia* var. *lanceifolium*).—A very distinct plant, one of the largest and strongest growers in the family. It has leaves nearly a foot in length, lanceolate in shape, and tapering to the base, while the scapes often reach a height of 2ft. in favourable situations. On these the pink or rosy purple flowers are borne in umbels of four to six in late spring. It is usually found

in wet places on the mountains of East Oregon and California.

D. LEMOINEI.—A plant of garden origin, with broad leaves and scapes 1½ft. to 2ft. high, bearing up to twenty flowers, varying in colour from deep rosy purple to pale lilac. It is probably a form of the following.

D. MEADIA.—The most popular member of this genus, easily grown and very free-flowering, is a beautiful plant for the shady border. It produces an abundance of long, broad leaves and numerous scapes up to 2ft. high, each bearing twenty or more large pendulous reflexed flowers during the month of May. It was one of the earlier kinds to be introduced, having been grown in the year 1709 in the garden of the Bishop of London. It is figured in one of the earlier volumes of the *Botanical Magazine*, t. 12, and is named after a Dr. Mead. In its natural habitat it is confined to the country west of Pennsylvania, and usually grows on moist cliffs and drains. There are numerous colour forms of this species grown in gardens, varying from rich rosy purple through all intermediate shades to pure white.

D. PAUCIFLORUM.—From East Oregon and New Mexico, this plant has one to seven flowered umbels of pale purple flowers with a yellow ring at the base.

D. RADICATUM.—One of the smaller kinds, which is here illustrated, is a native of New Mexico and Colorado. It has tufts of lanceolate leaves and scapes bearing five to seven rose-coloured flowers in May.

D. TETRANDRUM.—A slender plant with narrow leaves, from Oregon, where it is found growing in wet places in the Wallowa Mountains. The scapes are about 6ins. high and bear two to three flowers in spring.

Many of these *Dodecatheons* make excellent pot plants for use in the alpine house. The roots can be potted up in the autumn, and the pots should be plunged in an ash-bed in a sheltered position where they can receive attention. During the month of May they will produce their flowers freely and prove a welcome addition to the other plants in bloom at that season. W. I.

A RARE AND BEAUTIFUL SHRUB

As long ago as 1780 that beautiful shrub, *Fothergilla major*, was introduced into England. It appears to have been entirely lost sight of by the end of the eighteenth century, both here and in the United States, and was not seen again until a few years ago, when it was re-discovered on the Alleghany Mountains of Virginia and brought once more under cultivation. It is a deciduous shrub, ultimately 6 feet to 8 feet high, erect in its branching, but forming a shapely bush. The leaves are roundish, 3 inches to 4 inches long, dark glossy green above and greyish white beneath.

At the time of flowering the twigs are leafless or only just bursting. The flowers are very curious in having no petals, their beauty being due entirely to the densely clustered stamens, which are pinkish white with yellow anthers and three-quarters of an inch long. The quaint brush-like tufts are composed of numerous flowers, but are smaller than may frequently be seen. They are sometimes cylindrical and 2 ins. long.

The shrub is very hardy, a good grower and easily increased by cuttings. It is difficult to account for its disappearance from gardens 100 years ago, for they were not then so embarrassed with riches in the way of hardy trees and shrubs as we are to-day.

MORE ABOUT THE GREAT SHOW

STOVE AND GREENHOUSE PLANTS

(Continued from page 278.)

In No. 1 tent was a table group of Schizanthuses, exhibited by Mr. Alfred Dawkins, 468, King's Road, Chelsea. The plants, as usual, were extremely free flowering and of compact and dwarf habit. A fact worthy of note was the richer colourings of many of the flowers—a welcome feature of this Chelsea Show.

A very large, comprehensive group was set up in tent No. 1 by Messrs. John Peed and Son, West Norwood, London, S.E., in which many of the better and more popular Caladiums, Streptocarpuses, Gloxinias, Petunias, Hydrangeas and kindred plants, were all attractive and highly interesting. There were, among others, the following noteworthy Caladiums: John Peed, Mine. J. Box, Red Ensign, Marquis of Camden, C. E. Dable, Racine, candidum Roncador, John Laing and William Rappard. The strain of Streptocarpus shown by this firm was distinctly good and the colours very pleasing; the same may be said of the Gloxinias, of which some sorts were especially charming. The group as a whole was a fine feature of the Show.

A huge exhibit was put up in the same tent by Messrs. Webb of Stourbridge. Imposing banks of highly coloured, well grown Cinerarias in both grandiflora and stellata forms made a gorgeous display. Herbaceous Calceolarias have seldom been so well represented; the flowers were large and the plants freely flowered, and they embraced some of the loveliest colours ever seen in this early summer-flowering plant. Much may be said in favour of the beautiful Schizanthuses which were shown in superb form and condition. The colours were pleasingly diverse and the plants flowering in prodigal profusion. Noteworthy, too, were the Gloxinias, Rhodanthe and Primula obconica, and there were other plants which space will not permit us to mention. Backed with Palms and edged with Ferns and other fine foliaged plants, this group merited the attention of all visitors.

At the Embankment end of tent No. 1 Messrs. Jas. Carter and Co., Raynes Park, London, S.W., occupied the whole end of the tent with a superb exhibit, shewing the highest artistic skill and embracing plants representing cultural skill of the best. Here were to be seen mounds of Cinerarias, in grandiflora and stellata forms all most charmingly disposed and representing a wide range of colouring. Stately Clarkias occupied the centre of the group at the back, in front of which were large, well grown Schizanthuses, Antirrhinums, Gloxinias, Petunias, herbaceous Calceolarias and other beautiful plants. This group was embellished with hanging baskets of Schizanthuses and edged with beautiful grass, Ageratum and Ferns. At either side of the two doorways were Sweet Peas and other well grown flowers, the whole group making one of the very finest features of this great Show.

Cacti, Ferns and Palms were shown as a table group by Mr. H. N. Ellison, West Bromwich, in No. 2 tent, and, as usual, this grower's group was distinctly interesting. The Cacti were represented by a number of small plants of the more popular sorts. Of the fine foliaged plants a few things that called for special notice were Platycodon Veitchii, Cibotium Schiedei, Gymnogramme Martensii, Cheilanthes elegans (the Lace Fern), Adiantum decorum magnificum, Onychium japonicum, Tomaria ciliata and Pellaea ternifolia. There were many other beautiful things in this group.

On the western side of No. 2 tent Messrs. L. R. Russell, Limited, Richmond, staged one of their large and comprehensive groups of stove and greenhouse plants for which they have so good a

Secret. Small fine-foliaged plants made a pretty edging.

Baskets of Fancy Pelargoniums were shown by Messrs. Godfrey and Son, Exmouth. They made

A GLIMPSE OF MESSRS. ALLWOOD'S FINE EXHIBIT OF CARNATIONS AND ALLWOODII.
(Described in our last issue.)

reputation. Here were to be seen in capital condition many choice and beautiful plants, of which we see too few nowadays. We were struck by the beauty of *Medinilla magnifica* bearing long pendulous trusses of pink blossoms, Caladiums in variety, such as Mrs. L. R. Russell, Thos. Tomlinson, Rising Sun, William Rappard; *Clerodendron Balfourii*, Crotons and *Dracenas*, the towering *D. Victoria* being in fine form. Noteworthy was *Billbergia Forgoettiana*, shown in good form; *Anthurium Scherzerianum* was attractive, *Gloriosa Rothschildiana* was bright and showy. There were numerous other plants all worthy of careful inspection.

The centre of Messrs. W. Cutbush and Sons, Limited, Barnet, group at the Embankment end of No. 2 tent comprised Hydrangeas in variety; set up in a fine group and with a groundwork of the same plant, with Palms as a background and *Nephrolepis* as a fronting, the group had much to commend it. The better Hydrangeas that called for attention were *Directeur Vuillermont*, a new dark blue sort; *Maréchal Foch*, heliotrope; the lovely rich pink *Helge*; *Lorely*, another pleasing rose pink sort; and *Viscountesse de Vibray*, a dainty sky blue that was most attractive.

In the same tent was a small table group shewing a scarlet ivy-leaved Pelargonium named *Sir Percy Blakeney*. This was shown by the Blakeney Nurseries, Plumtree, Nottingham.

A long table group, also in tent No. 2, comprising Fuchsias and Verbenas Miss Willmott and King of Scarlets, was a pleasing feature. We do not see many Fuchsias nowadays, and it was interesting to see specimens of such sorts as *Mauve Beauty*, *Ballet Girl*, *Fascination*, *Royal Purple* and *Eton*, all doubles. The single-flowered sorts were seen in such varieties as *Mrs. Marshall*, *The Doctor*, *Display*, *Cupid* (very pretty), *Emile Zola* and

an attractive table group in No. 2 tent. Some of the varieties were very bright and pleasing, notably *Prince John* (very dark), *Delightful*, *Reginald Godfrey* (attractive), *The Prince* (rich), *Gipsy*, *Magnate*, *The Queen* (lovely pink), *Dazzler* and *Fascination*.

Immediately opposite the last-mentioned group was another table group of cut Zonal Pelargoniums. Some of the sorts were beautifully represented, both spikes and individual pips being of high quality. We were charmed with *Somerset Lass* (pleasing scarlet), *Scarlet King* (rich scarlet), *Pride of the West* (rosy cerise), *Staplegrave Pride* (salmon), and *Daintiness* (white, suffused salmon). There were several good double and semi-double sorts. This group was shown by Mr. Reginald J. Case, Taunton.

Cut flowers of Zonal Pelargoniums were shown by Messrs. Jarman and Co., Chard, in the same tent. Noteworthy were *Uranus* (salmon scarlet), *Cymric* (purple), *General Wolseley* (clear rosy red), *Dublin* (rose), and *St. Louis* (scarlet crimson), and many double sorts.

A beautiful group of Calceolarias with an edging of White Schizanthuses was set up by Baron Bruno Schröder, Dell Park, Englefield Green, Surrey, in No. 2 tent. There were grand specimens of the Schizanthuses, and they attracted much attention. The Calceolarias were crosses between *Clibranii* and herbaceous sorts, and were shown in much variety.

An exceedingly interesting collection of Cacti and Succulents was shown by Mr. Sydney Smith, 51, Falmer Road, Enfield. This was a collection for the specialist and proved highly interesting to many. Specially noteworthy Cacti were the following: *Manillaria micromeris* (specimen forty years old), *Pilocereus senilis*, *Manillaria pusilla*, *Echinocactus Pfeifferi*, *Opuntia cylindrica cristata*,

Echinocactus *Scopa crista* and Echinocactus *Baroni*. In all there were about 300 varieties of Cacti and Succulents exhibited and their quaint and curious forms were quite fascinating.

HARDY PLANTS

This is always a prominent section at Chelsea and once more one looked for the unkindly stains of a wintry May, only to find that such little accidents as were apparent were easily overwhelmed by the splendour and lavish generosity of these herbaceous and other flowering plants, most of which had been grown entirely in the open.

Messrs. Wallace and Co. had a superb collection, beautifully arranged, among which the hardy Lilies were a noteworthy feature. The lovely *L. regale* was seen in all its entrancing beauty; there were some groups of *L. Orange Queen* in a refreshing golden buff, and of the sweetly recurved *L. Willmottiae*, and towering above these and others some lovely spires of the incomparable *L. excelsum* (testaceum). If we had to take off our hats to the last named, not a few hesitated to go down on their knees to look into the exquisite grace and purity of *L. Farreri*. *Eremuri*, *Lupins*, *Ixiolirions*, *Incarvilleas* and *Cypripediums* also arrested one's attention among the many fine exhibits on this stand.

Mr. J. C. Allgrove of Slough had a notable staging which was dominated by some excellent spikes of *Eremurus robustus*, *Elwesianus* and others. There were also some remarkably fine clumps of *Primulas*. *Pæonies lobata* and *Veitchii* and the *Globe Flowers* (*Trolliuses*) also claimed

admiration, nor did many pass this group without noting *Campanula* *Telham Beauty*.

Verbascums and *Trolliuses* occupied a goodly share of Messrs. G. Gibson and Co.'s stand and this Yorkshire (Bedale) firm is to be congratulated on their new *Globe Flower*, Mrs. G. Gibson, with heads of enormous size and wonderful colour.

Poppies also compelled one's admiration here, as also they did in the excellent show put up by the Chalk Hill Nursery Co. of Reading. This firm makes a speciality of *Mimulus*, *Violas* and *Pansies*, all of which were well represented.

Messrs. Barr and Co. had a first rate display of herbaceous and other plants, with no little distinction in the manner of grouping. Few could pass the lovely Spanish Irises, the *Gladioli*, *Lupins*, sumptuous Oriental Poppies and *Pyrethrums* shewn by this well known firm without getting busy with their notebook, nor could one say less of Mr. Amos Perry's splendid array. If we may dare to make comparisons among the host of lovely things displayed there, the honours of the hour must, we think, go to Mr. Perry's seedling Irises (*barbata*), to the many little Iris species, to the wonderful trusses of *Primula helodoxa* and the *Pæonies*, among which last were some amazing sheaves of blossom. In the midst of this great show a patch of the vivid carmine *Dianthus Fosterii*, with a curious lead-blue eye, struck a distinctly novel note of colour.

Messrs. Bees had a stand of very choice plants, conspicuous among which were the *Primulas*. *P. rigida* was one of the daintiest little things in the Show and the drooping blue heads of *P. nutans*, all silvered with meal, were inexpressively lovely. *Draba* *Bee's Yellow* was conspicuous in this

collection and here also was a fine display of the chastely beautiful *Rosea cantonioides*. There were some notable examples of what can be done with the *Meconopsis* clan, *M. pseudo-integrifolia* being not less alluring in its own way than the group of highly refined *M. cambrica*, the double form in various shades of orange. The *Beesian Columbines* were a striking feature here also and there were some *Pyrethrums* of outstanding merit.

Messrs. Dobbie and Co. had a display of *Anthrinnums* which almost rivalled that firm's Sweet Peas in variety of colour and fragrance, the spikes of blossom being extraordinarily fine. From still further north came a splendid display of *Auriculas*, *Polyanthuses* and *Cowslips*, and lovers of the first-named in particular were amazed to hear that all these had been grown in the cold, unkindly soil of a Perthshire nursery. Messrs. Storrer and Storrer, who were responsible for this choice little lot, found many to admire the size and substance of their marbled *Auriculas*, the glowing tints of their Hybrid *Cowslips*, coloured *Primroses* and not a few old-world members of this always popular class.

The *Primulas* shewn by Dr. Macwatt of Dunis, N.B., were a feature of the Show, among these fascinating things were several of outstanding merit and rarity. One has only to mention *P. vincaeflora*, the drooping heads of *P. heucherifolia* and *septemloba*, both the true forms of a brace of exceedingly uncommon species. Other notable plants there were *P. sibirica* and *chionantha*, shewn in excellent form, and a rare good patch of *P. sikkimensis*. The rare *Primula Smithiana* would, no doubt, be mistaken by many people for the altogether larger *P. helodoxa*. *P. seclusa*

THE BEAUTIFUL SALMON PAPAVER PRINCESS ENA, ON MR. W. WELLS JUNIOR'S EXHIBIT.

MOST SHAPELY OF PINKS, DIANTHUS HERBERTII MODEL.

and PP, secundiflora and vittata were other gems in an unrivalled collection, of which the *pièce de résistance* was a plant of the delicate but supremely beautiful *P. lupicula*.

Once again from the north came the stand of Messrs. Oliver and Hunter, with some admirable

Two first-rate displays of Violas and Pansies were those of Messrs. Yandell of Maidenhead, and H. Clarke of Taunton. In Aquilegias and Iris sibirica, Messrs. Vickers of Royston had a wide selection on view. In cut flowers, as in other departments, Messrs. J. Cheal and Sons had a

independent season it had been necessary to subject the plants to a certain amount of forcing. This season's novelties included Mrs. Giffard Woolley, a wonderful salmon pink sort with deeper lacing and practically the size and texture of a first-class Border Carnation; Fire King, also of excellent size and form and of almost vermilion colouring; and Prince of Wales, not very dissimilar in colour from Mrs. Giffard Woolley, but of entirely different style. Bridesmaid, which received an award last year, was a universal favourite with its tender salmon colouring and admirable pink shape.

Of the standard varieties, Queen Mary, rose pink and deep crimson, and the perfectly formed Model, attracted very much attention. The deep ruby crimson Victory, too, though on the small side, was exceedingly attractive.

DAHLIAS

A few plants of dwarf bedding single Dahlia "Coltress Gem" was shown by Messrs. John Forbes (Hawick), Limited. It is a bright crimson scarlet flower, and the plant is one of promise.

Although out of season, the display of Dahlias growing in pots was welcomed, as it enabled would-be growers to obtain plants at once and flower them later in the year outdoors. Messrs. Carter, Page and Co., London Wall, E.C., made a display of this kind, and there were many types and varieties shown. Of Collarette sorts there were Hornet, Henri Farman, Eclipse (very fine), Maurice Rivoire, Diadem and Aria. Decoratives were represented by President Wilson and Delice; Paony-flowered by Wurbook and Porthos; and other types were also well shown. A quite interesting exhibit.

Messrs. J. Cheal and Sons, Limited, Crawley, had a small table group of Star and Mignon single Dahlias. The Star Dahlias are unsurpassed for garden decoration and for cut flower. Star varieties shown included Kent Star (rich crimson, tipped mauve), Yellow Star, White Star, Primrose Star, Crawley Star (rose pink), Crimson Star (brilliant), Brighton Star (rosy maroon), Morning Star and Southern Star.

IN MESSRS. JOSEPH CHEALS' GARDEN.

Primulas, among which one noted PP, muscarioides, behangensis and secundiflora in the pink of condition. There were also some fine specimens of the Meconopsis class in this choice collection, M. Pratten and a rare form of integrifolia, viz., M. brevistyla, being particularly good. Very impressive also was the clump of Iris Susiana and a group of Geum Borist shown by the above firm.

Delphiniums were seen in all their Oriental magnificence at Messrs. Blackmore and Langdon's stand, species of most astonishing colour towering to a height of 10 ft.

Messrs. Bakers of Wolverhampton showed, on a very long staging, Sunbeam Poppies, Trolliuses, Lupins and other cut flowers. Aquilegia corulea in good form was seen here, also the fine double yellow Geum Lady Stratheden and a particularly rich-coloured specimen of Kalma latifolia.

Tritonias and Oriental Poppies, Lupins and Pyrethrums dominated the stand of Mr. W. Wells, jun., of Merstham, Papaver Princess Ena and a sheaf of Thermopsis montana being among the most striking of the exhibits. Hard by we came to a fine display of Violas and Pansies put up by Mr. John Forbes of Hawick. Dahlia "Coltress Gem," a single bedding Dahlia, was a conspicuous plant on this stand, and few who love the old, old plants missed some fine specimens of Hesperis matronalis alba fl. pl., with its stock-like scent.

Messrs. Downer of Chichester had an excellent display of Lupins of rare quality, together with Peonies and other plants of that character; and Messrs. Miller, Wisbeck, who make a specialty of hardy herbaceous plants, were well up to line with Pyrethrums, Hemerocallis and Oriental Poppies, some of the best being very choice. Though he had but a single exhibit, Mr. T. Gifford of Hornchurch is to be congratulated on his display of the uncommon Peonia officinalis lobata, shown in faultless condition; and many were very delighted with the several new Antirrhinums exhibited by Mr. H. Hensley of Crawley.

Messrs. Maurice Richard of Christchurch had a very large show of cut flowers, great trusses of Lupins, Poppies, Pyrethrums and Eremuri occupying the lion's share of a fine bit of staging. Among some of the more outstanding plants on this stand were Campanula Dora Blue, Verbascum phoeniceum alba and Peonia anemoniflora rosea.

superb collection, the Poppies, Lupins and Minuluses being especially noteworthy.

To do full justice to the splendid exhibit of Messrs. John Waterer in this section is impossible. Suffice it to say that a towering pile of Delphiniums presided over a great bed gay with Lupins, Oriental Poppies, Pyrethrums, Aquilegias and many other plants, all shown in excellent form and admirably laid out.

PINKS

"Pinks" at Chelsea always bring to mind Mr. Herbert's masterpieces in this direction. This year the selection was better than ever, but the quality was a little inferior to last year. Owing to the

THE UPPER PART OF MESSRS. CARTERS' SPRING GARDEN.

ALPINES AND ROCK PLANTS

Few among the multitudes who, last week, looked to Chelsea for an abundance of good things could have gone away disappointed, for, even though the show of alpine was not, in some respects, equal to that of former years, the quality of the exhibits generally was of as high an order as we have ever seen it. Novelties were not a notable feature anywhere in this department, but one noted with satisfaction how well so many of the best of the newcomers of a few seasons ago are holding their own and proving their fitness for our varied methods of culture and even more varied climate. If we except the oceans of mud in which we paddled around, one felt conscious of but one regret at this fine Show, a regret that a section so immensely popular as that comprising the alpine and rock plants could not be afforded more space, or, if that were impossible, a show entirely to themselves.

Among the most interesting and extensive collections of rock plants was that of Mr. G. Reuthe of Keston. Here one noted a large pot of *Hyacinthus fastigiatus*, the rare *Pinguicula Reuteri*, a pink-flowered Butterwort of distinction, and a particularly large form of the native violet species. There were several pots of *Ramondia pyrenaica* in a wide variety of colours, *Oxalis adenophylla*, the dainty *Allium neapolitanum*, and that delightful Californian, *Silene Hookeri*. The wee-est thing in Roses, *R. Rowlettii*, from Spain, was shown in good form here; and hard by one noted that glowing marvel, *Fritillaria pyrenaica*, *Scilla italica* and the lovely *Linaria aquitriloba*. *Veronica ficifolia* attracted much attention here as did the Geum-like *Sieversia elata*, whose large flowers in a warm Indian yellow were very striking. *Philesia buxifolia* was also in flower on Mr. Reuthe's stand, and there were some fine plants of *Olearia holosericea*, *Dodecatheons* and *Cypripediums*.

There were some bold groupings on the rock-garden staging set up by Messrs. John Waterer, Sons and Crisp, Limited. *Viola Black Knight*, which might be described as a much enlarged, coal black *gracilis* with an orange eye, was shown in quantity near a fine drift of *Dryas octopetala*—a good form in nice condition. There were some large clumps of *Thymus nitidus*, a bed of the gorgeous *Minulus Coronation*, and many *Cypripediums*, admirably shown. Nestling under a fine bank of *Primulas* were several specimens of the true *Spiraea digitata nana*, prettily tucked in among a plantation of the elegant *Vancouveria hexandra*. *Pentstemon heterophyllus* was here in full bloom, along with the wonderful *Aster alpinus* Wargrave variety, *Armeria Lauchiana* and some excellent *Erigerons*. *Ledum intermedium*, carrying a blaze of little blossoms, was a shrublet that few rock gardeners would pass unnoted, and there were one or two dwarf *Cytisuses* exhibited in fine feather on this staging.

The lay-out of the exhibits brought down by Mr. F. G. Wood of Ashted was a cleverly executed bit of rock gardening which attracted considerable notice. Here we had, in addition to some well placed rocks, a tiny water garden and some planted crazy-paving—all on a few yards of staging. *Lithospermums petraeum* and *intermedium* were well shewn here, and the clump of *Pentstemon Scouleri* was probably the best in the Show. There were several bits of *Morisia hypogaea*, *Saxifraga aizoides atrovirens* made a glow of rusty orange near the cool lavender of the dainty little *Phlox Fairy*, and there was a good exhibit of the much taller, blue-lavender *Phlox Laphami*. *Viola gracilis Clarence Elliott* was seen in first-rate forms on this staging, along with some other seedlings with the same "blood" in them.

Another exceedingly pleasing stretch of rock formation, with the plants set out most naturally, was the work of the Misses Hopkins, Shepperton-on-Thames. There were some choice *Dianthus*es,

A very taking assembly of alpine in pots appeared under the name of Messrs. Prichard and Co., Wimborne, a noteworthy specimen among these being a large pan of *Parochetus communis* in

MESSRS. R. TUCKER AND SONS' ROCK GARDEN.

Violas, *Cistuses* and *Saxitrages* on this stand; but what attracted even more attention were the many old-world plants on view. Some of the *Daisies* among these latter were especially good, and along with these we spotted the quilled double in a soft pink that made something like a sensation twenty years ago.

Yet another skilfully constructed length of rock garden was staged by Mr. E. Scapellhorn of Beckenham. *Saxifrages pyramidalis*, *Lissadell* and Dr. Ramsey were notable objects here; and the exhibit of *Cotyledon simplicifolia* was one of the best we have seen for some time. *Ourisia coccinea* was in fine feather against some groups of *Primulas helodoxa*, *Cockburniana* and *capitata*, there was a nice exhibit of a good form of *Geranium Traversii*, and not many visitors would fail to notice the little bush of *Kalmia rubra*, among many other good things.

We next came to a large collection of alpine and other plants from the well known Christchurch firm of Messrs. Maurice Prichard and Sons. On this extensive staging there were not only very many plants of special merit, but the arrangement was as admirable as the condition of the individual plants themselves. A group of *Dodecatheons* was an impressive feature, and among a quantity of *Dianthus*es, the hybrid *Pinks Ida* and *Perdita*—offspring of neglectus—were surpassingly lovely. *D. squarrosus* and the true *D. sub-acaulis* were also among the elect. The sulphur-flowered *Achillea tomentosa* King Edward; *Saxifrages* Dr. Ramsey, *calabrica* and *pyramidalis compacta* were all well shewn, and there were some first-rate *Sedums*. Among these last a clump of *S. spathulifolium purpureum* ablaze with its golden stars was a most arresting feature and, though there were many rarer things in this fine exhibit, there were few more exquisite than a mass of *Silene alpestris fl. pl.* and another of *Scabiosa caucasica*.

The exhibit of *Houstonia cœrulea* doubtless made not a few visitors envious, and another excellent little plant well shewn here was the pretty *Gypsophila cerastioides*. *Veronica rupestris rosea*, a plant by no means common, was included in good form. There were some pots of the dainty little *Thymus parviflorus*, several *Lithospermums* and a lovely clump of *Geranium cinereum rubrum*.

From the Oxford nursery of Messrs. R. Tucker and Sons one expected to find alpine plants of distinction and merit and we were far from being disappointed. These were planted very tastefully about bold rocks of weathered limestone, in which *Dianthus alpinus* looked particularly happy. Another Pink that was not likely to escape notice was the clear rose *D. microlepis rumelicus*. There was a very full muster of *Sedums* on this staging, *Lewisia Howelii* was shewn in first rate form, and the soft rosy purple of *Phlox compacta* struck an unusual note of colour among others of its clan. Some first-rate *Dodecatheons*, the well known "Cotswold" *Verbascums*, *Viola bosniaca* and a forest of Lilliputian rock-garden conifers also deserve special mention, though one can here do but scant justice to a collection so distinctive in the selection and quality of its exhibits as this one.

Another ambitious piece of rock formation with the plants *in situ* was that of Mr. H. Hemsley of Crawley. A large carpet of the gorgeous *Heeria elegans*, blazing with vivid crimson-carmine blooms, attracted a lot of notice on this staging, as did the much more modestly coloured *Viola arborea*, a pale silvery turquoise nestling among grass-green leaves. *Nierembergia rivularis* and some *Androsaces*, *Trollius europæus albus* and the dainty-leaved *Veronica Beibersteinii* were noted among many other "classy" individuals sent along by Mr. Hemsley.

Messrs. Maxwell and Beale, Broadstone Nursery, sent a splendid array of *Mesembryanthemums*

which only needed a little sunshine to open their blooms. Even so, there were one or two, notably *M. cordifolium* and *M. melanderum* with very big blossoms in a dainty satiny pink, which were bold enough to expose their glistening

perennial variety of outstanding quality. *Micro-meris* in full flower, *Linarias*, *Geranium Pylzowianum*, *Fabiana imbricata* and many *Primulas* of much merit were also among the many good things included in this extensive array.

DRYAS OCTOPETALA, SO WELL SHEWN BY MESSRS. WATERER, SONS AND CRISP.

rays to the gloom of the earlier days of the Show. The charming little *Bellis cornuola* and *Banifva petraea*, like a silver-grey *Armeria*, were also in this collection, as was a first rate form of *Potentilla rupestris*. A fine mound of *Campanula Steveni* attracted the attention it so fully deserved and there were some plants of *Silene alpestris* with semi-double flowers of unusual size. In addition to their *Primulas*, alluded to elsewhere, Messrs. Oliver and Hunter, from Monnaive, Dumfries, shewed *Oxalis emeaphylla rosea*, the beautiful *Saponaria Boissieri* and some choice *Armerias*. The true *Aquilegia alpina* was set out in first rate form by this firm and another specimen of much distinction was *Phlox subulata* 'Aurea', a charming plant with the best attributes of both its parents, *Aquilegia glandulosa* and the creamy-white *flabellata* were also among this collection and we marked down *Achillea Kellereri* as one of the best of its race.

Not many rock garden enthusiasts who delight in tiny plants would pass unobserved the carpet of *Arenaria gothica* shewn by Messrs. Bowell and Skarratt of Cheltenham, a planting wee enough to make *A. hibernica* appear a giant by comparison. The true *Dianthus Freynii* was another of these wee things, to which *Saxifraga tenella* hard by, was a happily chosen companion. The lumpy heads in deep navy blue of *Veronica austriaca* made a most effective carpet of bold colour and we liked the large daisy-like flowers, with their quaintly scalloped edges, of *Anacyclus formosus*. *Veronica rupestris rosea* was among the more notable exhibits on this stand and the delightful *Viola pedata* was admirably shewn. *Oxalis adenophylla* was exhibited in quantity by this firm, and excellent plants they were, and we also much liked the longifolia hybrid *Saxifraga Francis Cade*, a

Mr. Ernest Dixon of Putney shewed a number of little plants in a small garden of walks, lawns and lakes, all in a square yard, and his mountain slopes of *Sagina* turf and out-cropping rocks inspired much keen interest.

Mr. Geo. G. Whitelegg of the Chislehurst Nurseries, had a display of alpine and other plants tastefully arranged among rocks, the *Sempervivums*, *Saxifrages* and alpine *Asters* being a particularly pleasing lot. There were also some *Campanulas*, *Dianthus*es and one or two *Onosmas* on this staging which were well above the general level.

Messrs. W. H. Rogers and Son of Southampton also had a fascinating assortment backed by some *Leptospermums* in excellent bloom. Here again the rock construction was a creditable piece of work and a goodly lot of *Sempervivums* looked very attractive in their natural setting. Some of the double forms of *Meconopsis cambrica* shewn by this firm were remarkable for their depth of colour and compactness, and there were some patches of *Minulus* of rare quality. The dainty *Iris gracilipes* won much deserved admiration, as did *Ajuga Brockbankii*, *Campanula Steveni* nana and the *Primulas* shewn by the same firm. *Cistus purpureus*, *Trolliuses*, *Thalictrums*, some very attractive *Heucheras* and *Erigerons* in great variety made a gay display of colour among the shrubs and other plants shewn under the well known name of Messrs. B. Ladhams of Southampton.

The density of the crowd which thronged about Mr. Clarence Elliott's indoor exhibits was sufficient evidence of the interest which this enthusiastic rock gardener has aroused in this section, and his length of staging was indeed crammed with little things of "top-hole" merit all set out with unimpeachable taste. A large mat of *Veronica chamaedrifolies* perhaps attracted the lion's share

of public applause, though we preferred a perfect little group of the ravishingly lovely *Aquilegia glandulosa* and a colony of the tiny inch-high *Iris cristata*. There were several clumps of *Primulas* of the first water in this collection, a delightful little Tibetan *Allium* in a fine rosy lilac and the pale blue *Viola elatior* on its stiff, bushy stems. The bronzy-leaved *Epilobium glabellum* and the dainty *Trollius pumilus* were noted in association with a colony of that admirable dwarf London Pride, *Saxifraga Umbrosa* Elliott's var., a vivid ruby in flower and stem. *Oxalis emeaphylla rosea*, for which we are indebted to Mr. Elliott's keen love for alpine quality, was shewn in faultless form. There were some pretty *Campanulas* and *Wahlenbergias*, *Iberises* and *Armerias*, *Astrantias* and *Thymes* also on view, to mention not a tithe of the exhibits.

Messrs. K. and J. Hill of Eastbourne are alpine specialists and, on a cleverly designed piece of rockwork staging, they shewed the gay *Linaria Broussonetii*, *Convulvulus mauritanicus* and the distinguished-looking *Campanula Laurii* in a fresh rosy lilac. *Cistuses formosus* and purpureus were seen in good form here, and the quaint *Helichrysum Selago* invited many enquiries.

The several *Dianthus*es of the alpinus class shewn by Messrs. Carter Page and Co., London Wall, E.C., were among the finest we have come across for some time, and no less can be said of the exhibit of *Lithospermum Heavenly Blue* on the same stage. *Thymus nitidus* was also well shewn, and one welcomed *Dianthus Caesar's Mantle* as an old friend that is now becoming rare. *Saxifraga longifolia* and *S. l. latifolia* were shewn in grand form by this firm and *Veronica rupestris alba*, still an uncommon plant in gardens, was exhibited *en masse*. Upon the *Primulas* and other plants shewn by the above house we have commented elsewhere, but one must add a word of praise for the admirable way in which the rocks and plants were disposed on Messrs. Carter Page's staging.

Last, but not least, comes the big collection on view under the name of Messrs. J. Cheal and Sons, Crawley, in which, amid a most naturally laid-out section of rock construction we noted *Imum monogynum* in an extra large type. The rich cherry red *Phlox pilosa*, *Linaria origanifolia*, *Calamintha alpina* with flowers like a violet Snapdragon, *Sedum pilosum* in full bloom and a lovely group of *Primula capitata* were among the more noteworthy objects to be seen here.

TREES AND SHRUBS

In our report under the above heading in last week's issue all reference was omitted to Messrs. M. Koster and Sons' *Rhododendrons* and *Azaleas*. These fully bore out Mr. Millais' forecast which we published in our Correspondence columns last week (page 279). The brilliant cherry-red *Madame de Bruin* attracted much attention here as it did, too, in Messrs. R. Wallace and Co.'s stand. The huge trusses of *Corry Koster* also made an excellent impression—the blossoms are a pale buffish salmon heavily spotted crimson on the upper lobe when the flowers are young, but the spotting rapidly fades as the flower ages. *Hugh Wormald* is another very distinct variety of rosy cerise colouring with a conspicuous band of white down the centre of each petal. Every plant shewn, however, was noteworthy, and it is a very long while since so many good new *Rhododendrons* were ever exhibited together. *Koster's "Brilliant Red" Azaleas* would have made an even greater impression than they did had it been generally appreciated that the plants exhibited were seedlings, the strain having been fixed to come true to colour from seed.

BEGONIAS

Immediately inside the Chelsea Hospital entrance to tent No. 1 Messrs. Blackmore and Langdon, Twerton Hill Nursery, Bath, set up one of their inimitable exhibits of Tuberous-rooted Begonias. Notwithstanding the extraordinary weather experienced of late this firm shewed these plants in ideal form and condition. Unbruised and perfect it is a standing marvel how they are made to travel so well. A few of the more noteworthy sorts were Hilda Langdon, a large rose pink sort of ideal form, shewn in excellent condition; Mrs. F. Bedford, blush shaded flesh in the centre, of superb form; Lord Lambourne, a flower of remarkable colour, this being deep rich apricot, the form also being very fine. A frilled sort of pleasing form was Mrs. Hugh Moncreiff, a pale salmon cerise. Peace, a rich cream flower, shaded lemon in centre, was noteworthy, as was J. W. Pyman, a glowing crimson scarlet of ideal form. These are just a few of the gems of this wonderful collection.

VIOLAS

At the Embankment entrance of No. 2 Tent Mr. William Yandell, Maidenhead, made a beautiful display of garden and exhibition Violas. It was a most comprehensive display, and the flowers were all that any grower could well desire. Specially noteworthy sorts were Royal Scot (deep blue), Kitty Bell (lavender), Klondyke (yellow), Maggie Mott (mauve blue), Moseley Perfection (large rich yellow), Mrs. Chichester (fancy marbled sort), Archie Grant (indigo blue), Primrose Dame (primrose), Bridal Morn (deep mauve blue). This was a very charming display and a pleasing contrast to most other plants shewn.

A very fine exhibit of Violas was staged by Mr. H. Clarke, Taunton. The flowers were arranged in vases obscured in moss, and disposed in baskets most effectively. Both exhibition and garden

sorts were shewn. Of the garden sorts we liked Swan (white), Gladys Finday (deep purple blue edge, white centre), W. H. Woodgate (pale blue), Maggie Mott (mauve blue), White Empress (white), Lady Knox (primrose) and Moseley Perfection—all well done. This was a splendid exhibit.

Bedding Violas arranged in green-painted bowls, were shewn by Messrs. John Forbes (Hawick), Limited, Hawick. Old and popular sorts set up were James Pilling (fancy), Mrs. Chichester (marbled), Archie Grant (indigo blue), Lady Knox, Kitty Bell (lavender), Royal Sovereign (yellow), Moseley Perfection (rich yellow, very large), Maggie Mott (mauve blue), John Quinton (mauve) and Jackanapes (an old form of Pansy).

A pleasing series of Violas was shewn by Messrs. Jarman and Co., Chard. *Viola cornuta* purpurea, *V. c. alba* and *V. c. Mauve Queen* were set up in fine form and condition. There were many seedlings of gracilis type besides the Grecian Violet itself.

ORCHIDS

A most effective group of Orchids was staged by Mr. Pantia Ralli, Ashted Park, Surrey (gardener, Mr. S. Farnes). This well known amateur had massed several plants of the showy kinds so that a bold display was made. There were many excellent examples of the pure white *Cattleya Magali Saider* and of the elegant *Cypripedium Maudiae*, while on pedestals were seen *Laelio-Cattleya Excelsior* with a dozen flowers, having the petals flushed with purple like the lip, and *L.-C. Canhamiana* carrying ten superb blooms. Touches of blue were given by *Vanda cœrulea*, and dark red flowers were carried numerous on *Renanthra Imshootiana*. A fine *Cymbidium* hybrid was to be seen in Castor, with large yellowish flowers.

Sir Jeremiah Colman, Bart., Gatton Park, Surrey (gardener, Mr. J. Collier), filled one of the

corner positions with a most representative collection of rare species and hybrids. The centre part was made up with white *Cattleyas* and red-flowering *Odontiodas*, the contrast being effective. *Dendrobium Golden Sunray* was one of the finest representatives of the genus in the Show; it carried nearly fifty large flowers of yellowish colour, with a crimson area on the base of the lip. *Dendrobium acuminatum* with eighteen flowers was another example of how well this genus is cultivated at Gatton Park. Among the *Laelio-Cattleyas* were brightly coloured varieties of G. S. Ball and Golden Glow. One of the most distinct of the many varieties of *Odontoglossum crispum* was staged in solum, while a large blotched variety was called Leonard Perfect.

Mr. H. T. Pitt, Stamford Hill (gardener, Mr. Thurgood), had a very pleasing group, containing the richly coloured *Odontioda Cardinal*, the weird looking *Nanodes Medusa*, several good varieties of *Laelio-Cattleya Fascinator* and a wide assortment of *Miltonia* hybrids, of which *M. vexillaria alba* and *M. Venus* were particularly fine. *Cypripediums* were well represented by the albino variety of *Curtisii* known as *Sandera*, and by *Enchantress*.

Messrs. Charlesworth and Co., Haywards Heath, staged an extensive exhibit, at one end of which was a bank of albino *Odontoglossum* hybrids, while at the other was a mass of scarlet and red *Odontiodas*. The centre was composed of numerous varieties of *Laelio-Cattleya Fascinator*, always to be seen at these important spring shows. In the recesses were areas of orange-red produced by *Laelio-Cattleya* G. S. Ball, while in other parts was a fine assortment of *Miltonia* hybrids, which are now very popular. One of the gems was *Odontioda Duchess of York*, bearing a mass of light scarlet flowers, and another was *Odontoglossum crispum* of the premier type, this representing a fine race of home-raised plants. One of the best of the large-flowering hybrids was seen in *Brasso-Cattleya Cliftonii*, while a giant

THE TINY MECONOPSIS LANCIFOLIA WITH RICH PURPLE BLOSSOM (LIFE SIZE).

DELICATE MAUVE BLOSSOMS AND MEALY STEMS OF THE RARE PRIMULA RUPICOLA FROM DR. MACWATT'S EXHIBIT.

Two beautiful Alpines shewn at Chelsea for the first time.

of its kind was also seen in *Odontoglossum* St. George.

Messrs. J. and A. McBean, Cooksbridge, Sussex, had a grand group of *Odontoglossum* hybrids, among them being *Fau-tina*, with red blotching, *Doreen splendens*, with a grand spike of twelve large blooms, while *O. Hyeana* carried two spikes with a total of thirty-one yellow and brown flowers. *O. crispum* var. *Gibraltar* had massive flowers, white, with a blotched lip. The centre of this group was made up of *Cymbidium* hybrids and the graceful *Oncidium McBeanianum*. Specimen plants were to be seen in *Laelio-cattleya* Isabel Sander, *Cattleya Cowania* alba and *C. Skinneri*, the latter having masses of small, but deep rose-coloured flowers. *Miltonia Phalaenopsis*, generally a difficult plant, was represented by a strong specimen, and among other *Miltomas* were the handsome blotched variety known as *G. D. Owen*, and a charming hybrid produced by crossing *vexillaria* alba with *Roezlii*, the centre part of this being bright yellow.

Messrs. Sanders, St. Albans, had many interesting plants in their excellent exhibit. Here, again, *Cymbidium* hybrids were used for the centre and along the back row, while close to them were fine examples of *Thunias*, now seldom seen, and a strong plant of the scarce *Dendrobium amoenum*, with numerous delicately tinted flowers. The exact centre was occupied with a grand specimen of *Cattleya Mossii* Wageri, having over twenty white flowers, while on either side were richly coloured *Odontiodas*, including that called *Chantier*, in which the colour was of intense scarlet. Among the fine varieties of *Miltonia* hybrids, one distinguished as *A. C. Barrage* was noteworthy; it bears sixteen large blooms, beautifully veined with soft rose. *Laelio-Cattleyas* were to be seen in *Dominiana* with eleven flowers, as well as in *Isabel Sander*, pure white, and *Aphrodite bicolor*, this latter having the petals flushed with purple.

Messrs. Stuart Low and Co., Jarvisbrook, also staged a splendid selection of *Laelio-Cattleyas*, especially good being *L. C. Aphrodite* var. *Sunray*, with flushed petals, and *L. C. Golderest*, with cream-coloured sepals and petals and a purple lip. *Cypripediums* were strongly in evidence here, and included the pretty *Maudiae*; the richly coloured *Goweri*; as well as *Rothschildianum*, always an attraction with its long outstanding petals; and *bellatulum*, a species now somewhat scarce. An old species was seen in *Aërides Fieldingii*, and another in a specimen of *Dendrobium Parishii*; while at the extreme ends were large plants of *Dendrobium thrysiflorum* with masses of yellowish flowers. *Brasso-Cattleyas* included the new *B. C. Villa Jeanne*, as well as *Cliftonii*, and another hybrid in this section was *Brasso-Laelio-Cattleya Triflantiana*. Several well grown plants of *Selenipedium grande* attracted attention by reason of their long ribbon-like petals.

Messrs. Cowan and Co., Southgate, had several excellent *Cymbidiums* in their well arranged group, especially noteworthy being the varieties *Ring Dove*, with cream-coloured flowers having a lip dotted with red, as well as *Wigeon* and *Vesta*. A species that is rarely seen so well cultivated as here shewn was *Cymbidium Devonianum*, with a pendulous spike of many flowers. The elegant *Cattleya Titius* was represented by several fine varieties; while *Odontoglossums* comprise pretty forms of *Jasper* and others of the amabile section. *Odontoglossum hastilabium*, now seldom seen, stood out prominently, as also did the handsome *Maxillaria Sanderiana* and several *Miltonia* hybrids. Among the popular *Odontiodas* were *Felicia*, with brownish flowers, and *Anethyst*, with scarlet blotching.

Messrs. J. Cypher and Sons, Cheltenham, had an attractive group at the end of the big tent. It contained many excellent *Cypripediums*, specially

noteworthy being one called *St. Swithin*, of *Rothschildianum* parentage and having the petals much elongated in vertical style. Some of the best *Brassavola* hybrids were staged here; they in-

cluded *B. L. Digbyano-purpurata*, *B. C. Digbyano-Mossii* with five immense flowers, and *B. L. C. Veitchii*, of intense rose colour. *Laelio-Cattleya Glowworm* carried six blooms of a charming golden yellow tint, the lip shaded with crimson; while along the back row was seen *L. C. Dominiana*, always handsome, and excellent examples of *Epidendrum* hybrids of the *xanthinum* section, the many flower spikes being mostly of orange and orange red colour.

Messrs. Flory and Black, Slough, exhibited two of the best *Cattleyas* in their large group; they were *Cattleya Irene* "Our Queen," a very large pure white flower, and *Cattleya Prince Shimadzu*, a grand flower having the petals unusually well formed. *Odontiodas* were in wide selection, as also were the *Miltonia* hybrids. One of the best strains of *Laelio-Cattleya Dominiana* was staged by this firm. Several elegant *Cattleyas* received worthy attention, and of them mention may be made of *C. Heatherwood*, with a large crimson lip, and the albino *Cattleya Irene*. Another speciality was *Cattleya Dr. M. Lacroze*, with bold flowers having an immense labellum of ruby crimson tints.

Messrs. Mansell and Hatcher, Rawdon, Yorks, had an effectively arranged group, the higher portion being composed of selected varieties of *Laelio-Cattleya Aphrodite* and *L. C. Fascinator*, while in *L. C. Ypres* the flower was somewhat larger and more highly coloured. A novelty was seen in *Cattleya Lady Duncan*, white with light yellow suffusion in the throat. An interesting hybrid was *Odontioda Bantingii*, obtained by crossing *Odontoglossum Uro-Skinneri* with *Odontioda Bradshawii*; it resembled the former parent, but had reddish spotting evenly distributed on all the segments. A fine specimen of *Miltonia vexillaria* stood at one end, while in the centre was *Brasso-Laelio-Cattleya Jupiter*, an immense flower of pleasing rose tints.

Mr. Harry Dixon, Wandsworth Common, exhibited several rarities, these including *Aërides crispum*, *Maxillaria nigrescens* (with flowers of

reddish brown tints) and *M. tenuifolia*. There was also a fine variety of *Lycaste Skinneri* alba, the choice *Cypripedium callosum* Sanderæ, and several curious representatives of the genus *Masdevallia*.

THE QUAINLY FOLIAGED CAMPANULA CALCICOLA.

Messrs. Armstrong and Brown, Tunbridge Wells, staged one of the best cultivated specimens yet seen of *Dendrobium acuminatum*, a species from the Philippine Islands, and bearing five many-flowered spikes of rose carmine flowers.

NEW AND RARE PLANTS

Begonia Lord Lambourne.—A very large yet refined double-flowered tuberous-rooted *Begonia* of perfect *Camellia* shape. The colour is pale orange and the foliage is nicely marked. The blooms are more freely produced than is often the case with the large double *Begonias*. Award of merit to Messrs. Blackmore and Langdon.

Campanula calcicola.—The flowers of this quaintly beautiful species are not very dissimilar from those of the *Harebell*, *C. rotundifolia*, but the foliage is very remarkable, being marvellously mottled and hairy both above and below. Award of merit to Mr. A. K. Bulley.

Carnation Donald.—This is a perpetual-flowering variety which bears large, flattish blooms of deep velvety crimson colour. The stems are long, stiff and slender, and it seems to be free-flowering. Award of merit to Mr. C. Engelmann.

Carnation Scarlet Iona.—A very shapely Perpetual-flowering *Carnation*. The flowers are of good rounded form, very full and the guard petals are prettily serrated. The colour is a bright substantial scarlet, and the stems and foliage are good. Award of merit to Mr. C. Engelmann.

Carnation Surprise.—This is a delicately beautiful perpetual-flowering variety of more than average size. The well formed fully double flowers are a beautiful soft shell pink colour, and they are carried on graceful, erect stems. Award of merit to Mr. C. Engelmann.

Hydrangea Triumph.—This is one of the dwarfest varieties, bearing large heads of bloom, that we have seen. The compact, well formed heads are of bright pink colour. It is an

exceedingly useful variety. Award of merit to Mr. H. J. Jones.

Incarvillea Bees' Pink. This is a very lovely variety of grandiflora type. The sturdy, dwarf stems bear plenty of large pale pink flowers of great fascination. Award of merit to Messrs. Bees, Limited.

Gentiana Hopei.—This is a blue Gentian of quite uncommon appearance. The plant consisted of an almost quite erect, dark purplish, fleshy stem about 9ms. high which was lightly furnished with somewhat fleshy ovate-lanceolate alternate leaves about 2ms. long. From the leaves sprang short branches of two, three or more flowers. These relatively large substantial flowers are of rich blue colour with distinctly paler blue interiors. It is rather early days to judge the value of this handsome Gentian, but its appearance suggests some difficulty of cultivation; but if it can be grown successfully, it is a highly desirable species. Award of merit to Mr. A. K. Bulley.

Rose Capt. F. S. Harvey-Cant.—We greatly admired this lovely Hybrid Tea Rose at Chelsea last May and again at the National Rose Society's Provincial Show, when it received a gold medal but we think it was even more beautiful on the present occasion. The substantial pointed blooms were of a rich shade of salmon-scarlet occasionally suffused with yellow. It should be an exhibition and cut bloom Rose with a great future, and no doubt is also highly decorative in the garden. Award of merit to Messrs. Frank Cant and Co.

Lupinus Downer's Strain.—The award was given to this now well known strain of excellent *L. polyphyllus* hybrids. Very long flower-spikes splendidly furnished with beautiful flowers of

various shades and combinations of colour were shewn. Those of pink shades and red and maroon were of striking appearance. Award of merit to Mr. G. R. Downer.

Primula chrysopa.—A very uncommon Chinese species which has all the appearance of being a splendid plant for the garden. It makes compact clumps of quite small, narrow, pale green serrated leaves. The flowers, which are carried well above the foliage on many-whorled stems are individually about the size of those on the wild Primrose, but the petals are divided into two distinct lobes. The colour is an attractive bluish mauve, much paler around the eye of the flower. Award of merit to Mr. A. K. Bulley.

Primula rigida. This very unhappily named species is very similar to *P. malacoides* as regards the inflorescence, but the foliage, as the attached picture shews, is quite distinct. It might well have received an award. Also shewn by Mr. A. K. Bulley.

Rose Chastity.—A very free-flowering perpetual climbing Hybrid Tea Rose. The medium-sized double flowers are of very pale creamy yellow colour. The neat foliage is a good dark green and the shoots are very vigorous. Award of merit to Messrs. Frank Cant and Co.

Rose Orange King.—The little blooms of this Dwarf Polyantha Rose were of the most novel and uncommon colour in the Show. The bushes are of erect habit and bear narrowly pyramidal heads of rather more than semi-double button-like flowers. As Roses they are failures, but the colouring is very fascinating. Award of merit to Messrs. William Cutbush and Sons.

Rhododendron Lady Constance. A large, perfectly formed, rounded truss of widely expanded

blooms which are of blood red colour at the margins and shade to pale pink in the centre of the flower. An exceedingly beautiful variety which appears to be rather more hardy than most of the *R. Aucklandii* hybrids. Award of merit to Mr. A. G. Soames.

Rhododendron Pink Shell. This is one of the delicately beautiful large flowered Rhododendrons which, unfortunately, are only for those who possess favoured gardens or are able to devote a glasshouse to them. It has a well formed truss of large, widely expanded blooms of delicate bluish pink colour with carmine lines radiating from the throat. Award of merit to Mr. T. H. Lowinsky.

Rhododendron "Snowflake." The award was given subject to the name, which has previously been used, being changed. It bears very large blooms of *R. Loderi* type and, except for a suggestion of green in the centre, they are snow-white. Award of merit to Mr. T. H. Lowinsky.

NEW ORCHIDS.

Dendrobium Gatton Sunray. A most attractive plant of large size obtained by crossing the two species *Dalhouseianum* and *chrysotoxum*. The semi-pendulous spikes carried fifty large flowers of yellowish colour, the lip having a reddish brown area at the base. Exhibited by Sir Jeremiah Colman, Bart., Gatton Park, Surrey.

Cymbidium Castor var. Laburnum.—This handsome hybrid between *insigne* and *Woodhamsianum* carried an arching spike of sixteen finely shaped flowers of cream and yellow colouring, the lip marked with dull red. Shewn by Mr. Pantia Ralli, Ashted Park, Surrey.

LIKE A GIGANTIC *P. SIBIRICA*, *PRIMULA CHRYSOPA*.

THE MALACOIDES-LIKE *PRIMULA RIGIDA*

Cattleya Prince Shimadzu var. Olympus.—Generally regarded as the finest Orchid in the Show. An immense flower with wide up-standing petals of mauve-purple colour, the large lip rich purple with crimson shading. The parents are *Hardyana* and *Tityus*. Staged by Messrs. Flory and Black, Slough.

Cypripedium Antinea.—A very distinct hybrid between *Godefroya* and *Lord Derby*, the sepals and petals being dull yellow evenly marked with lines of purplish red dots. Shewn by Messrs. Cowan and Co., Southgate.

Odontoglossum crispo-Solon var. Carmania.—Probably the best *Odontoglossum* seen this year

cross between *Lelio-Cattleya humosa* and *Brasso-Cattleya Mrs. J. Leeman* was of buff yellow colour, the immense labellum being prettily fringed at the margin and having a rose-tinted centre. Staged by Messrs. Stuart Low and Co.

The above received first class certificates.

Odontoglossum Gatton Emperor var. Nero.—A handsome result obtained in the collection of Sir Jeremiah Colman, Bart., Gatton Park, Surrey. The spike carried nine flowers of claret-red colour, the segments having a narrow rose-tinted border.

Odontioda Brilliant.—This is the result of crossing *Joan* and *Chanticleer*, two well known *Odontiodas* of rich scarlet colour, the same being

colour, except for a narrow whitish margin to the segments. Shewn by Messrs. Cowan and Co., Southgate.

Odontonia Olivia.—A remarkable hybrid between *Miltonia Bleuana* and *Odontoglossum triumphans*, and bearing five large flowers of light golden yellow colour effectively marked with reddish blotching. Staged by Messrs. Charlesworth and Co.

Cattleya C. P. Walker var. superba.—A compact flower in which the large labellum was richly coloured with ruby crimson. Shewn by Messrs. Flory and Black, Slough.

Miltonia Sanderæ var. Unique.—This pleasing

THE GIGANTIC EREMURUS ELWESIANUS MAGNIFICUS SHOWN BY MR. J. C. ALLGROVE.

MR. ENGELMANN'S NEW CARNATIONS SURPRISE, DONALD AND SCARLET IONA.

at Chelsea. Flowers unusually large, the segments very round and almost covered with rich purplish crimson blotching. From Messrs. J. and A. McBean.

Cattleya Irene var. Our Queen. A grand pure white hybrid obtained by crossing *Mossie* with *Suzanne Hye*. Flower of thick texture, the petals well balanced, the expansive labellum having a slight yellowish tinge in the throat. Staged by Messrs. Flory and Black, Slough.

Odontioda Duchess of York. A very pleasing hybrid of unknown parentage, but with a many-flowered spike of well formed flowers of a uniform scarlet colour tinged with yellow. Shewn by Messrs. Charlesworth and Co., Hayward's Heath.

Odontioda Radiant var. Majestic. One of the large flowering section and bearing an erect spike of twelve fleshy flowers and buds. In colour deep scarlet on a rose-tinted ground. Shewn by Messrs. J. and A. McBean, Cooksbridge, Sussex.

Brasso-Lælio-Cattleya Truffautiana var. Triumph.—The single flower carried by this

perpetuated in the seedling. Exhibited by Mr. Paula Rath, Ashted Park, Surrey.

Odontoglossum Llewellyn var. colossus.—The spike of this attractive hybrid between *amabile* and *Georgius Rex* bore six immense flowers with blue-purple blotching on a rose-coloured ground, the margin of the petals prettily toothed. Staged by Messrs. Charlesworth and Co., Hayward's Heath.

Odontoglossum crispum var. Esmeralda. A beautiful form of this popular species, the well cultivated plant bearing two arching spikes each with nine flowers of excellent texture and shape. Staged by Messrs. J. and A. McBean, Cooksbridge, Sussex.

Miltonia Butterfly var. Empress. This beautiful hybrid bore two spikes each with seven large flowers, the labellum having a crimson base. Exhibited by Messrs. Sanders.

Odontioda Seraphis var. Dusky Monarch. A handsome spike of six flowers, chocolate red in

hybrid carried a spike of eight large flowers having soft rose vening and with a blackish mask at the base of the labellum. Exhibited by Messrs. Sanders, St. Albans.

Brasso-Cattleya Villa Jeanne.—A new hybrid obtained by crossing *Cattleya Empress Frederick* with *Brasso-Cattleya Dietrichiana*, the large flower being of mauve-pink colour uniform in all the segments, the labellum deeply fringed. Shewn by Messrs. Stuart Low and Co.

Odontioda Murillo. The spike of this hybrid bore nine medium-sized flowers of reddish scarlet colour, the crest on the labellum being bright yellow. Staged by Messrs. Cowan and Co.

Miltonia Constance.—One of the best results obtained by using as parents *vexillaria* and *Isabel Sander*, the large flower having a prettily marked base to the labellum. Staged by Messrs. Charlesworth and Co.

All the above obtained awards of merit.

For Sundries and Awards, see page 300.

CORRESPONDENCE

TULIPA TUBERGENIANA.

CAN any of your readers inform me whether the above Tulip can be grown satisfactorily in Scotland and, if so, where first quality bulbs of this Tulip can be obtained? Mr. Van Tubergen of Haarlem sent an expedition to Central Bukhara in the spring of 1901, and this was one of the finds. Apparently it is a robust grower, but I should like the latest news regarding this Tulip, which appeared to be one of immense possibilities.—CARDROSS.

[Lord Cardross's letter was sent on to Mr. W. R. Dykes, the greatest living authority on species Tulips, and the following is his reply: "As far as I know, *Tulipa Tubergeniana* is now only in cultivation in a few private gardens. The firm of Van Tubergen has, I believe, no stock left at all. I have had a few of the original bulbs in cultivation since about 1908 or 1909, and from them I have raised 100 or 200 seedlings. It certainly is a very fine species, and there is no reason why it should not do well in cultivation provided the bulbs are lifted every year and planted again at the beginning of November."—ED.]

CLEMATIS FLAMMULA.

THERE are various places about the working parts of a garden that are apt to be un-beautiful but that can be redeemed by just the right planting. Such a one is the subject of the picture, a slab-walled enclosure that holds the supply of coke. It is never exactly unsightly because the rough upright slabs—the outside pieces first cut off the tree trunk by the steam saw—have a certain interest from their varied surface and cool grey colour. But in September, when the Clematis, loosely trained along the front and at one corner, is in bloom, it becomes quite a pretty garden picture. In another part of the garden a necessary roof of corrugated iron has become a bower of the wild Clematis (*C. Vitalba*), and a distressful object is converted into one of gracious comeliness.—G. J.

CLEMATIS FLAMMULA ON A SLAB FENCE.

A LOVELY PENTSTEMON.

MANY would consider *Pentstemon Scouleri* or I suppose we should write of it as *P. Menziesii Scouleri* to be botanically correct

A BUSH OF PENTSTEMON MENZIESII SCOULERI.

the best of all its clan. It has many good points, for it makes a bush large enough to be showy and its lilac rose blossoms are interesting in form, attractive in colouring and borne freely enough to make a good display. As with most of its congeners, it is readily propagated by means of

cuttings and, like many of the shrubby species, it is early summer flowering. It is seen at its best on rockwork, and should be given a sheltered corner, for it is none too winter hard, especially after a wet summer. It is well, therefore, to keep a few young plants in a cold frame or pit. The *Pentstemon* family, as a whole, is a most

ROSES AT CHELSEA.

I AM sending a few notes on the Rose exhibits at Chelsea, which I had the pleasure of judging on May 29. Generally, they were by no means up to the usual standard, but through no fault of the growers, for what can one expect in a climate like this, with no sun to bring the blooms out? One must refer to the weather in conjunction with all the exhibits, and no doubt the unpleasant duty of describing it will devolve upon your reporter who has command of the strongest language. I heard a charming young lady describe the mud outside the tents as "chocolate soufflé," a decidedly appropriate definition. The best representative group of Roses was that shown by Mr. Elisha Hicks—a bold and beautiful mass, and well staged, too. Unfortunately, the climbers and back-row Roses were somewhat weak, but to compensate for it the front row blooms were excellent. *Ophelia*, *Mme. Butterfly* and *Margaret Horton* were particularly good, and *David Lloyd George* looks promising. *Premier* is uncertain—I fear its colour turning blue, but the blooms shown were too young to judge it in a full blown state. The *Dwarf Polyanthas* were good, and the group as a whole was undoubtedly the best at the Show so far as Roses were concerned. Messrs. B. R. Cant and Sons had a fine exhibit, but chiefly of cut blooms. *Sovereign*, *Padre* and *Covent Garden* all stood out well, and it was a treat to see a good exhibit of an old favourite, *Lady Roberts*. I am by no means optimistic about *Constance Casson's* future. The full blooms discolour too much, though in the young state they are delightful. A very fresh exhibit. Messrs. Frank Cant and Co. shewed some first-class blooms,

particularly of Captain Harvey Cant, a promising new Rose. A fine row of well grown climbers as a background added materially to the good effect of this exhibit. The above-mentioned three exhibits stood out head and shoulders superior to any other Roses shown, although some of the others could claim some strong points of excellence. Messrs. Pauls of Waltham Cross showed some splendid Weepers, also good standard Hybrid Teas, but the latter were not yet in bloom. Messrs. Cutbush and Son had a pretty exhibit of Polyanthas, both dwarf and climbing, but lacking a few Hybrid Teas, etc., among them. They showed a new Dwarf Polyantha, Orange King, quite a novel break in colour and pretty in itself; but the colour will clash terribly near any pink or red Roses. Messrs. Water's group was marred by bad staging. Some of the tall climbers almost hid the centre of the exhibit from view. There were some nice and fresh blooms, but hardly enough

weight in the whole exhibit. Mr. George Prince was not quite up to his usual standard, and had an unfortunate position on the centre staging where, presumably, dark velvet background was barred, otherwise the Roses would have shewn up far better than they did. The background of climbers was decidedly weak, but what magnificent blooms of *Souvenir de Claudius Pernet*! Messrs. Pipers showed Weepers and Dwarf Polyanthas only, which do not appeal to the public so much as if a few Hybrid Teas are added. The general arrangement of this exhibit was excellent. A new Rose, *Papa Gourdault*, shewn here, was no improvement on what we already have. Mr. Pemberton's somewhat too crowded group consisted chiefly of Polyanthas. Mr. Charles Turner had a general group unfortunately mixed with Japanese Maples. Mr. Ernest Paul of Cheshunt had an exhibit which a few hours of sunshine would have materially helped.—HERBERT L. WETTER.

GARDENING OF THE WEEK

FOR SOUTHERN GARDENS.

The Kitchen Garden.

Asparagus.—This vegetable is now growing freely, but it is not wise to continue cutting after the middle of this month. In the meantime it is advisable to give the beds a soaking of liquid manure, but it ought to be applied when the soil is in a moist condition. Failing liquid manure, a light dressing of some reliable fertiliser may be given, while a sprinkling of salt can be afforded with advantage. Where the beds are in an exposed position the growths will need some kind of support to prevent them being broken down by the wind. A few stakes at intervals will suffice if string or wire is brought along between the growths. Pea sticks are also suitable.

Celery.—During the next week or two the main crop of Celery should be transferred to the trenches, for it is a great mistake to allow the plants to become starved in boxes or beds. In many instances the trenches are prepared, but in some gardens this is not always possible, and no time ought now to be lost in getting them ready. They should be about 4ft. apart, 15ins. wide and 10ins. deep when the work is completed. It will be necessary to place a liberal layer of manure in the bottom, and where the subsoil is poor the top spit should be returned to the trench to give the plants a start. Give the nursery bed a thorough watering a few hours before planting begins, and take care the roots do not become dry during the operation. The trench will take a double line of plants, and the latter should be 8ins. apart in the row. Select showery weather if possible when planting and, should we get a dry spell water the roots freely.

Runner Beans.—A late crop is always appreciated, and during the present month a further sowing should be made. Those sown earlier in the season will require staking, and after lightly pricking over the soil between the rows a mulching of manure may be given. If the weather is dry, an occasional soaking of water will be beneficial.

The Flower Garden.

Bedding Plants.—If the weather is dry, these will require frequent applications of water, and as rain and continuous watering harden the soil an occasional use of the Dutch hoe will be necessary. Pick off decayed leaves of *Pelargoniums*, and such plants as *Verbenas*, *Phlox Drummondii* and *Petunias* should be pegged down to furnish the beds well.

Brompton Stocks.—For producing a fine display in May and June these Stocks are recommended, but a long period of growth is needed, therefore the seeds should be sown during the next week or two. A cold frame is a good place wherein to sow the seeds, and directly germination has taken place admit plenty of air, and finally remove the lights to promote sturdy, short-jointed growth. When the seedlings are large enough they should be planted 10ins. apart where it is intended for them to flower.

Alpines from Seeds.—A large number of these charming plants may be raised from seeds and, now that the bedding plants are disposed of, an opportunity occurs to deal with the alpine section. *Dianthus*, especially the choice *D. alpinus* and *D. neglectus*, may be raised from seeds,

as also may *Saxifraga longifolia*, *Silene*, *Viola*, *Draba*, *Campanula*, *Aster alpinus* and varieties, *Aethionema*, *Linum* and a host of others. With care and attention success is more or less assured, and the best way to raise these plants is to sow the seeds in pots or pans which have been previously filled with fine soil. Place the receptacles in a cold frame and keep the glass shaded until the seeds germinate, when they should be gradually exposed to the light and, when large enough, pricked off in boxes or singly in small pots. Never allow the seed-pans to become dry.

Hollyhocks.—Seeds may be sown in the open ground, and when the seedlings have made two or three leaves be transplanted to their flowering quarters. The single varieties are very showy, and if these are grown there will be plenty of self-sown seedlings in the border.

The Hardy Fruit Garden.

Apples.—Trees of the pyramid or bush type are often grown in the kitchen garden, and here the object should be to secure fruit of excellent quality. This can be done by thinning the fruits directly it can be seen which will remain on the trees. Overcropping not only means inferior fruit but is detrimental to the general health of the tree. Although it is early to carry out the summer pruning, any superfluous side shoots may be removed. A mulching of partly decayed manure may be afforded, and a sharp look-out must be kept on all fruit trees for insect pests.

Fruits Under Glass.

Peaches.—When the fruit is gathered, the pot trees should be plunged in ashes or similar material on the frame ground, or given a position where it is warm and open to the sun. Keep the roots well supplied with water. Trees growing in the house from which the fruit has been picked will need all the light and air possible to enable next season's fruiting wood thoroughly to be ripened. The ventilators, both top and side, should be opened to their fullest extent and remain open at all times. The border must be kept moist but not saturated. Neglect in this respect is often the cause of bud dropping in spring or whenever the trees are started into growth. A certain amount of pruning may be done, cutting away any wood not required for next year in order more fully to expose the new shoots to the light. If the trees are infested with red spider or fly, they should be thoroughly wetted with some reliable insecticide and the following morning syringed with clear rain water. In the later houses the trees must be frequently sprayed until the fruit begins to colour, and ventilation will be necessary before the temperature in the houses rises to any great extent.

T. W. BRISCOE

(Gardener to W. R. Lysaght, Esq.),
Castleford, Chesham, Gloucestershire.

FOR NORTHERN GARDENS.

The Kitchen Garden.

Broccoli should now be planted without delay. Winter Broccoli is hardly worth troubling with in the North, and only a moderate quantity of the autumn varieties need be planted, as such Cauliflowers as *Veitch's Autumn Giant* can be had almost as late as the autumn Broccoli.

Dependence should be placed chiefly on spring varieties, for it is in spring that this crop is a valuable asset. A certain amount of space should be devoted to the variety known as *Purple Sprouting*, which is a much finer vegetable than its looks suggest. Moreover, it turns in a week or two ahead of the white varieties, when the choice of vegetables is limited.

Kales.—*Cottager's Kale* or "*Curly Greens*" is not a vegetable of superior quality, but it will succeed in spots where hardly any other vegetable will. *Asparagus Kale* or *Buda Kale* can be thoroughly recommended as an early spring vegetable, turning in as it does towards the end of March and remaining in good condition throughout April. These Kales should be allowed a distance apart of 18in. by 15ins. and Broccoli 2ft. by 1½ft.

Kidney Beans. The final sowing should be made. It will speed up germination if the seeds are soaked in cold water for a few hours; if soaked too long, they are apt to split. Allow 21ins. between the rows and 6ins. to 8ins. between the seeds. Earth up earlier sowings in due course.

Vegetables Under Glass.

Cucumbers, whether in a house or frame, will require considerable attention. As roots appear on the surface, apply a moderate top-dressing of fibrous loam plus a little bone flour or other fertiliser. Thin out the shoots where too thick and pinch those retained after the first joint beyond a fruit, and tie to the trellis if grown in a house. Shut up so that a little solar heat may be utilised after giving the plants, walls and pathways a good spraying with chilled water.

Tomatoes.—Apply bi-weekly doses of liquid manure of moderate strength to plants swelling their fruits. Go over plants in flower with a rabbit's tail about midday; pinch out all laterals.

The Hardy Fruit Garden.

Gooseberries will now be in demand for tarts, and in most cases probably, the bushes will be the better for being relieved of part of the crop. When picking for this purpose there is always a temptation to the inexperienced to take the easiest way and pick the partially developed fruits right forward; this should be guarded against, and the fruit should be thinned out as uniformly as possible over the entire area of the bush, otherwise the thinning will not relieve the bush in full measure.

Strawberries.—Where young plantations are expected to yield a crop next summer, the sooner the runners are layered the better, as the plantation should be made as early in August as possible so that strong crowns may be built up before the end of the season.

Plums.—Large specimens of *Victoria* in the open often produce such a superabundance of fruit that the branches have to be propped up to prevent them from breaking. In such circumstances thinning is a physical impossibility, but all dessert varieties on walls should be gradually thinned to reasonable dimensions if necessary. e.g., to from 3ins. to 4ins. apart on an average. This attention will both make for the benefit of the fruit retained and for the future welfare of the trees.

The Flower Garden.

Border Pinks.—These old-time favourites may now be had in great variety, and are very attractive during the early summer. Cuttings, or pipings as they are often called, if taken now or during the next few weeks will root freely in sandy soil under a hand-light behind a wall or hedge. On well drained soils the well known white *Pink Mrs. Sinkins* can be used as an edging alongside garden walks.

Polyanthuses, often called *Bunch Primroses*, and varieties of the Common Primrose, *Primula vulgaris*, which have been used for spring bedding and which have been temporarily laid in by the heels should now be lifted, divided and planted out at a distance of 12ins. by 9ins. in soil containing a good deal of humus in a cool position. Here they will recuperate and develop, and will be ready in the autumn again to be utilised for spring bedding. It is advisable, however, to have a batch of seedlings coming on, and those who have such pricked out in boxes should now accord them the same treatment as is advised for old plants.

Phloxes.—These showy herbaceous plants prefer a quarter to themselves, but whether grown separately or in the mixed border they will be much benefited by a top-dressing with a fairly rich compost, as they are shallow rooters, the roots often showing above the surface if only accorded treatment in common with the rank

and file of herbaceous plants. Phloxes are generally the first to suffer from the effects of drought.

Roses.—Keep a look-out for suckers and promptly remove them, detaching them by a sharp wrench rather than by a clean cut.

CHARLES COMFORT

(Formerly Head-Gardener to Mrs. Haig, Broomfield, Davidson's Mains, Midlothian).

GREENHOUSE AND CONSERVATORY.

Chrysanthemums will soon be ready for their final potting. The potting soil should be prepared a week or more in advance, and turned over several times in the meantime. The compost should be fairly heavy, with a little leaf-soil added and enough clean coarse sand to ensure free drainage, or old mortar rubble may be used in place of the sand. A 6in. potful of bone-meal should be added to every bushel of soil. The practice of using half-inch bones is not advisable, as I do not consider the plants have time to obtain much benefit from them. It is much better to feed at the proper time, that is, when the plants have well filled their pots with roots, as they are then in a proper condition to take advantage of any manures supplied. As firm potting is very essential, the soil should be in the proper mechanical condition, neither too wet nor too dry. After potting, the plants are best stood close together at the bottom of a wall for about two weeks.

Smaller plants may be grown in pots, and are best kept in low pits or cold frames during the summer months. Bouvardias are very subject to attacks by Begonia mite, which should be prevented by the use of the sulphur vaporiser.

Streptocarpuses are not generally regarded as suitable for furnishing the greenhouse, but a batch of plants grown on from last year have been giving a good display for some weeks now. When used for furnishing the greenhouse they should not be grown in too high a temperature, an intermediate temperature of about 50° being best. Under such conditions they grow strong and sturdy, and last in flower for a long time. Plants raised from seed sown early in the year should be grown steadily on, and should give a good display towards the end of summer. If seed is sown at this time, the resulting plants will make a good show next season.

Royal Botanic Gardens, Kew. J. COULTS.

OBITUARY

OWEN THOMAS, V.M.H.

It is with much regret that we have to record the death, at Ealing, in his eightieth year, of Mr. Owen Thomas, for some ten years Superintendent of the Royal Gardens, Windsor, and, at the time of his death, one of the oldest contributors to THE GARDEN. He had been lying in a practically hopeless condition for some weeks, following an attack of pneumonia. Much sympathy will be extended to his widow and family in their sad bereavement.

Mr. Thomas was head gardener to Sir Robert Peel at Drayton Manor, near Tamworth, in the 'seventies and afterwards successively for Mr. John Corbett, the "Salt King," at Impney Hall, Droitwich, and the Duke of Devonshire at Chatsworth. He took up the Superintendentship of the Royal Gardens in 1891. Mr. Thomas raised a number of new fruits, including the still popular Frogmore Selected Tomato and Cucumber Every Day. He also wrote a good deal on matters horticultural, particularly about fruits.

Mr. Thomas was a very successful exhibitor. He was awarded the coveted Victorian Medal of Honour in Horticulture twenty-six years ago. He leaves three sons and two daughters. His son, Mr. H. H. Thomas, is a well known and highly respected horticultural writer.

FORTHCOMING EVENTS.

June 11.—United Horticultural Benefit and Provident Society's Meeting.—Bath Gardeners' Society's Meeting.

June 12.—Fortnightly Meeting of the Royal Horticultural Society (2 days).—Jersey Gardeners' Society's Meeting.

June 13.—Yorkshire Gala (3 days).—East Anglian Horticultural Society's Meeting.

HORTICULTURAL SUNDRIES AND APPLIANCES

This is, perhaps, the most difficult section to report. One can easily enthuse over beautiful flowers, but who can enthuse over mowing machines, ladders, insecticides, etc.? However, all these things are absolutely necessary to the gardener, and without them he would be in a very sorry plight. Now to get down to business. The sundries were situated, as usual, down the Lime Avenue and in close proximity to it. Unfortunately, owing to a slight shower (which lasted all day on the Tuesday) the avenue became somewhat muddy, though it was quite practicable in waders! However, visitors were able on the two following days to inspect this section in more or less comfort.

The famous Acme labels shown by Mr. John Pinches, 3, Crown Buildings, Crown Street, Camberwell, need no description, as every good gardener is conversant with them. On this stand, too, were to be seen an improved "Radiant" stand. These should find immediate favour with the exhibitor, as they are suitable for practically any flower. The "Corona" flower displayer was much admired by the ladies; it is exceptionally useful for rose bowls. Vases of all shapes and sizes in zinc and tin were also on show. Exhibition boxes for Roses (as used by the National Rose Society) no doubt appealed to secretaries of local rose societies. Pergola chains, the "Chippendale" trainer for standard Roses, adjustable trainers for Clematises and standard Roses, together with innumerable other valuable acquisitions, all attracted attention.

The Chase Continuous Cloche Company, Chertsey, shewed its well known cloches and demonstrated their usefulness by exhibiting garden Peas, bearing pods, which had been raised under them.

Mowing machines, both motor and the ordinary "push" varieties, were shown and demonstrated by Messrs. Shanks of London.

The well known Atco motor mower was shown by Messrs. Chas. H. Pugh, Limited, of Birmingham. We had recently under trial one of these machines, and it gave the greatest satisfaction in use.

Messrs. Ransomes of Ipswich shewed their well known mowing machines, including motor mowers.

Insecticides were much in evidence. Messrs. Murphy and Son, Limited, of Mortlake had "Alvesco" on show, which is of good repute as an all-round insecticide.

Messrs. H. Scott and Sons of Woodside, London, S.E., had on view loam, weed killers, insecticides and garden barrows.

A bewildering array of admirably designed watering cans of all shapes and sizes was displayed by Mr. Haws of Clapton.

Messrs. Robinson Brothers, Limited, of Bromwich shewed lime-sulphur washes and insecticides, as well as Multiple (an excellent fertiliser for vegetables) and a new watering can fitted with two roses, which should appeal to the amateur gardener.

Garden manures were displayed by the Cross Bone Manure and Lime Company, Limited, of Bridlington.

Bee hives and appliances in great assortment, the former excellently constructed in sound timber, were shown by Messrs. E. H. Taylor, Limited of Welwyn. These found great favour with our bee expert.

Messrs. Abol, Limited, displayed their famous syringes, lawn sands, "Stictite" for grease-handling fruit trees, worm killers, etc.

Garden ornaments in great variety were to be seen on the "pitch" of Messrs. Kelly and Co. of Marylebone Road, London.

Fruit tree protectors constructed of netting were shown by Major Walker of Brecon, South Wales. Various sorts for warding off birds, wasps, cold winds and frost were on view.

Greenhouses and heating appliances were shown by Messrs. James Gray, Limited, of Chelsea.

The Key lawn fertiliser was displayed by the Key Fertilizer Company, also of Chelsea.

Garden implements of every description were to be found on the stand put up by Messrs. A. Smellie and Co., Limited, of Rochester Row, Westminster. A somewhat interesting and highly useful exhibit on this stand was a glazing-bar fork for strengthening the wooden supports of greenhouses.

The Wilkinson Sword Company of 53, Pall Mall, S.W., had on view their well known rust-proof pruners and garden knives.

Messrs. Corry and Co., Limited, Bedford Chambers, W.C.2, brought insecticides, weed killers and fertilisers.

Garden implements, lawn sands, etc., were shown by Garden Supplies, Limited, of Liverpool.

The well known horticultural builders, Messrs. William Duncan Tucker and Sons, Limited, of Tottenham, shewed greenhouses of many descriptions, also garden frames.

The Stonehouse Works Company of West Bromwich shewed various attractive kinds of spraying tackle, fertilisers and insecticides.

Garden furniture was displayed by the Papworth Industries of Cambridge.

Messrs. Arthur Moorton, Limited, had bird baths, sundials and art pottery.

The Itala House Limited, 39, Wigmore Street, W.1, shewed Italian garden furniture and pottery.

Capital extending ladders and, indeed, ladders and steps of every conceivable description were shown by the Acme Patent Ladder Company of Earlsfield and Leatherhead.

Of exceptional interest to lady visitors was the exhibit of cane garden furniture shown by the Dryad Cane Company of Leicester.

Garden tools were displayed by Messrs. Holtzapffel and Co., 53, Haymarket, S.W.1.

Horticultural washes and sprays were shown by the famous Jeyes' Sanitary Compounds Company, Limited, of Cannon Street, E.C.4.

THE LATE OWEN THOMAS, V.M.H.

Under such conditions they are not so exposed to sun and drying winds, and thus have a much better chance of establishing themselves. After the roots have got a good hold of the fresh compost the plants may be stood out in their summer quarters, standing them on a bed of ashes. Large plants grown for decorative work may be partly plunged, as this prevents them being blown over. Plants grown for exhibition blooms should not be plunged, the usual practice being to stand them on boards; they, of course, must be staked when stood out and the stakes secured to wires strained to posts.

Bouvardias.—Where large plants are required, they should be planted outdoors in a bed of rich soil. Under such conditions they make fine large plants, which in their season give goodly quantities of cut flower. The strongest shoots should be stopped frequently to ensure a good bushy habit.

The House and Garden Sundries Company, Limited, of 10, Eastcheap, E.C.3, showed their well known seed sowers, wall clips for fruit trees or climbers, netting supports for Raspberry, Currant and Gooseberry bushes, also for trees on walls. Their latest novelty is their patent straining wire for Raspberries and other hardy fruits which obviates the use of string or other tying material. They also showed a novel hammock. This will be useful to those who have no trees to which to sling a hammock. It folds up and takes up very little space. This hammock should appeal to those who are fortunate enough to be able to have "forty winks" after lunch. (Horticultural journalists, unfortunately, are not included in this category.)

Messrs. McDougall and Robertson, Limited, of Manchester showed their now well known insecticide Katakill, and a large assortment of weed killers, insecticides and fertilisers.

Wheelbarrows, ladders and trucks were exhibited by Mr. H. C. Slingsby of 142-146, Old Street, E.C.1.

Stacks of fibrous yellow loam were shown by Mr. A. B. Johnston of New Park, Cranleigh.

Spraying machines and syringes of various sorts were displayed by the Four Oaks Spraying Machine Company of Sutton Coldfield.

Messrs. James Carter and Co. of Raynes Park had a large exhibit of garden furniture, garden tools, mowing machines, etc.

Motor mowing machines were exhibited by Messrs. Dennis Brothers of Guildford.

Messrs. Boulton and Paul of Norwich had a revolving garden shelter, garden frames, greenhouses and conservatories, also garden seats.

Garden tools of all descriptions were shown by Messrs. Richard Melhuish of 50, Fetter Lane, E.C.4.

The famous Pattison lawn boots for horses were shown by Messrs. H. Pattison of Streatham Common. Here, too, were garden tools of all descriptions and Sarel's patent spiked roller. This should prove of inestimable value to golf enthusiasts. This machine is useful for draining and aerating turf, and its use does not tear the grass. They also demonstrated the Majestic revolving lawn-sprinkler, an excellent invention.

Miss A. Everitt of 2, Harriett Street, Sloane Street, S.W., had a varied collection of garden gloves. These should appeal to the ladies and amateurs who have delicate skins.

Messrs. Hawker and Botwood, Limited, of Grays, Essex, showed their well known fertiliser, Prize-Crop Here, too, were to be seen the insecticide Sox and Dyo-weed, a non-arsenical weed killer.

Greenhouse and garden frames were shown by Messrs. F. Pratten and Co. of Midsomer Norton, Bath.

Messrs. W. Voss and Co., Limited, London, E.14, displayed their famous winter and summer spraying fluids, fertilisers and weed killers.

Garden furniture was shown by Messrs. Abbott Brothers of Southall.

Fertilisers, including fish manure, bone-meal, Ichthenic guano and Tomorite (for Tomatoes) were exhibited by Messrs. Prentice Brothers of Stowmarket.

Garden frames and greenhouses were displayed by Messrs. Drummond and Co. of Ware.

Nicotine sprays, "Gyp" (a non-poisonous insecticide and fungicide) and fertilisers were shown by Messrs. Edward Cook and Co., Limited of Bow, London.

A varied assortment of ladders was displayed by Messrs. T. Drew, Clark and Co. of London, S.E.1.

Messrs. T. Green and Son, Limited, of Southwark Street, S.E., exhibited their well known mowing machines and rollers.

"Fertabs," advertised as "pills for plants," are, in fact, a very concentrated fertiliser put up in tablet form for the amateur to whom weights and measures are an abomination. These were shown by Fertabs, Limited, of 141, Moorgate, London, S.E.2.

Various lime preparations were shown by the Buxton Lime Firing Company, Limited, of 11, Queen Victoria Street, E.C.

Garden tools were exhibited by Messrs. Thomas Gunn, Limited, of 30, Fore Street, London, E.C.2.

Messrs. William Cooper and Nephews, Limited, of Berkhamstead showed various spraying fluids, nicotine washes and weed killers, including their famous Weedicide.

Mr. H. J. G. Wood of Bracknell, Berks, showed the Willmott Rival plant stakes. These wire stakes, which are painted green, are of various lengths and thicknesses. There are, for example, stakes suitable for tall-growing Dahlias and others for the frail stems of such plants as Fuchsias. These wire stakes have one great advantage, and that is that they last a long time, whereas wooden supports are easily broken and they decay.

Messrs. Skinner, Board and Co. of Bodminster, Bristol, showed their wire tension greenhouses.

Castles Shipbuilding Company, Limited, Baltic Wharf, London, S.W.1, had an exhibit of garden furniture.

Messrs. Piggott Brothers and Co., Limited, of 220, Bishopsgate, E.C., exhibited garden tents and furniture. Greenhouses and heating apparatus were shown by Messrs. J. Weeks and Co., 92, Victoria Street, S.W.1.

Garden ornaments, including a wide selection of sundials, were displayed by Messrs. Sanders and Co., 365-367, Easton Road, N.W.1.

Heating apparatus was extensively shown by Messrs. Charles P. Kinnell and Co., Limited, of Southward Street, London, including the famous Horse Show boiler, Bison boilers and the new twin fire boiler. They also exhibited hoses.

Rustic houses and a wide assortment of garden furniture were exhibited by Messrs. Harrows Limited of Knightsbridge.

Greenhouses and heating apparatus were displayed by Messrs. Messenger and Co., Limited, of 122, Victoria Street, S.W.

A large collection of garden tools, mowing machines and greenhouses were brought up by Messrs. William Wood and Son, Limited, of Taplow.

A fine assortment of garden furniture was exhibited by Messrs. A. W. Gamage, Limited, of Holborn.

Messrs. David Swain and Co., 101, Sussex Road, Holloway, had greenhouses and many garden frames.

Garden furniture and garden ornaments were shown by Messrs. Hughes, Bolckow and Co., Limited, of Dover Street, Piccadilly.

OFFICIAL LIST OF AWARDS

Sherwood Cup for the most meritorious exhibit in the Show: Charlesworth and Co. for a group of Orchids.

"Dudley Graphic" Cup for the best rock garden: B. H. P. Symons Jeune.

Cain Cup, for the best exhibit by an amateur: Mr. Pantia Ralli.

Allwood Carnation Bowl, for the best group of Carnations exhibited by an amateur: Sir William Cain, Bart.

Gold Medal and congratulations: R. W. Wallace and Co., for Lilies, Rhododendrons, etc.

Gold Medal: L. R. Russell and Co. for stove plants.

Silver-gilt Flora Medal: James Macdonald, for Grasses.

Silver Banksian Medal: Maytham Gardens, for herbaceous border.

Carnations.—Gold medal: Allwood Brothers and C. Engelmann. Large silver cup: Sir William Cain, Bart.; James Douglas, for Border varieties. Silver-gilt Flora medal: The Right Hon. Lord Lambourne, C.V.O.

Silver-gilt Banksian medal: Keith Laxford and Co. Silver Flora medal: C. H. Herbert, for Pinks; Stuart Low and Co. Silver Banksian medal: C. H. Taudévin. Bronze Flora medal: Andrew Ireland and Hitechock, for new Mascott's Dianthus.

Herbaceous.—Gold medal: George Jackson and Son, for Clematises. Large silver cup: Barr and Sons, for bulbous and herbaceous plants. Small silver cup: J. C. Allgrove, for herbaceous plants and shrubs; Bees, Limited, and W. H. Rogers and Son, for alpinos and herbaceous plants. Silver-gilt Flora medal: G. R. Downer and Maytham Gardens, for Lupins; M. Prichard and Sons, Bakers Limited, Bowell and Skaratt, Maxwell and Beale, and F. G. Wood, for herbaceous plants and alpinos; Reansbottom and Co., for Anemones; Storrie and Storrie, for Primulas, etc.; W. Wells, Jun., for herbaceous plants. Silver-gilt Banksian medal: Chalk Hill Nurseries, for hardy perennials, Mimuluses, etc.; J. Cheal and Sons, Limited, for rock and herbaceous plants and Dahlias; G. and A. Clark, Limited, for hardy flowers; G. Reuthe, for herbaceous plants, etc.; John Waterer, Sons and Crisp, Limited, W. Artindale and Sons and R. H. Bath, Limited, for herbaceous plants; K. and J. Hill, for alpinos; G. W. Miller, for hardy plants; V. C. Vickers, for Aquilegias. Silver Flora medal: B. Ladham, Limited, and Rich and Co., for herbaceous plants; G. Gibson and Co., for herbaceous plants and new Lupins. Silver Banksian medal: F. Gifford, for Paeonies.

Orchids.—Gold medal and congratulations: Charlesworth and Co. Gold medal: Mr. Pantia Ralli and J. and A. McBean. Large silver cup: Sanders, and Stuart Low and Co. Small silver cup: Sir Jeremiah Colman, Bart. (gardener, J. Collier), Cowan and Co., J. Cypher and Sons.

Silver-gilt Flora medal: Flory and Black. Silver-gilt Banksian medal: Mansell and Hatcher, Limited. Silver Flora medal: H. Dixon. Silver Banksian medal: Mr. H. T. Pitt.

Formal Gardens, etc.—Gold medal: J. Carter and Co., for water garden; Kent and Brydon, for formal rock and water garden. Large silver cup: W. H. Gaze and Sons, Limited, for informal garden. Small silver cup: J. Cheal and Sons, Limited, for formal garden. Silver-gilt Flora medal: Orpington Nurseries Company, for formal rose garden; W. Wood and Son, Limited, for formal garden. Silver-gilt Banksian medal: Ernest Dixon, En-Tout-Cas Company and R. Neal and Son, for formal gardens. Silver Flora medal: Hodsons Limited, for formal garden. Silver Banksian medal: J. Piper and Son, for formal garden.

Sweet Peas.—Gold medal: Dobbie and Co., Limited. Large silver cup: Alex. Dickson and Sons. Small silver cup: R. Bolton and Son. Silver-gilt Flora medal: Sutton and Sons. Silver-gilt Banksian medal: A. Ireland and Hitechock. Silver Flora medal: J. Stevenson. Bronze Flora medal: Preston Hall Nurseries.

Flowering Trees and Shrubs.—Gold medal: R. and G. Cuthbert, for Azaleas; R. C. Notcutt, for flowering shrubs. Silver-gilt Flora medal: William Cuthbush and Son, for clipped trees; W. Froom and Sons, for Japanese Maples; L. R. Russell, Limited, for Azaleas and shrubs; Bonard Nursery Company, for new and rare shrubs; Hillier and Sons, Limited, for choice flowering shrubs and trees; M. Koster and Sons, for Rhododendrons and Azaleas; G. Reuthe, for rare shrubs. Silver-gilt Banksian medal: Charlton and Sons, for trees and shrubs; John Waterer, Sons and Crisp, for shrubs and Rhododendrons. Silver Banksian medal: Fletcher Brothers, for Rhododendrons and conifers; J. Klinkert, for topiary; Yokohama Nursery Company, for Azaleas and dwarf shrubs; J. Cheal and Sons, Limited, for shrubs; T. Lewis, for Rhododendrons and Kalmias. Bronze Flora medal: R. Green, Limited, for Bay trees.

Firies.—Large silver cup: Angus Perry, for Firies, etc. Small silver cup: Orpington Nursery Company, for Firies. Silver Lindley medal: H. Chapman, Limited, for Firies. Silver-gilt Banksian medal: G. Bunyard and Co., Limited, for Iris garden. Silver Flora medal: G. G. Whitelegg, for Iris garden.

Fruit and Vegetables.—Gold medal: G. Bunyard and Co., Limited, for fruit in baskets. Hon. Vicary Gibbs (gardener, E. Beckett), for vegetables; T. Rivers and Son, Limited, for fruit trees in pots. Large silver cup: Laxton Brothers, for Strawberries.

Florists' Flowers, etc.—Gold medal: Blackmore and Langdon, for Begonias and Delphiniums; James Carter and Co., for flowering plants; Sutton and Sons, for annual garden. Silver-gilt Flora medal: Dobbie and Co., Limited, for Antirrhinums, etc. Silver-gilt Banksian Medal: Mr. Aubrey F. Wootton, K.C. for show Pelargoniums. Silver Flora medal: A. Dawkins, for Schizan-

thus, Godfrey and Son, for Pelargoniums, Schizanthuses, etc. Silver Banksian medal: Carter Page and Co., for Dahlias; R. J. Case, for Pelargoniums; H. Clarke, for Violas; John Forbes (Hawick), Limited, for Violas, etc., and Pelargoniums; W. Vandell, for Violas.

Imperial Fruit Show.—The Imperial Fruit Show staged in 1921 and 1922 at the Crystal Palace is, we are informed, to be held this year at Belle Vue Gardens, Manchester, between October 26 and November 3. It is this year being organised by a committee set up by and representing all sections of the fruit-growing industry, which proposes to organise the Show on a similar scale as heretofore, and to provide new features by the introduction of Potatoes and flowers in season at that time of the year. The National Potato Society are already arranging to co-operate to provide interesting features and to run competitions for the Potato section of the exhibition. Over £1,000 in prizes in the form of cash, medals and trophies will be offered in the various sections of the competition for commercially grown fruit. These sections are so arranged as to provide local competition within the county of Kent, within the Eastern Counties and within the West Midland counties, and general competition in two other sections, i.e., the Great Britain Section and the British Empire Section. Further sections are included for commercial growers in Ireland, the Channel Islands and Overseas. A further competition is also to be organised for amateur growers. The Committee earnestly invite subscriptions either in the form of guarantees or towards the prize or general fund to enable them to put the finances of the exhibition on a sound business scale from the commencement. About £1,700 has already been guaranteed.

EDITOR'S TABLE

FROM Messrs. T. Smith, Daisy Hill Nursery, Newry, Co. Down, a firm long noted for its collection of Brooms, came to hand recently a number of beautiful varieties of the Common Broom, Cytisus scoparius. Many of these are in the way of the well known variety Andreanus, but with slightly different colouring. The richly coloured Firefly is now fairly well known. Newry Seedling shows a combination of purplish crimson with the soft sulphur of the Moonlight Broom (C. scoparius pallidus). Also included in the collection is Rosy Moonlight, evidently of the characteristic spreading Moonlight habit but stained with rosy crimson. Daisy Hill splendens is another richly coloured one, Mayfly another showy one with bright bronzy crimson wings, and there is a congested form of this called Mayfly compacta. Andreanus splendens represents the best and most deeply coloured form of this popular plant, and, of a more slender habit of growth, Dragonfly has very similar colouring. Fulgens is practically a brownish crimson self, for the standards are heavily flushed to match the wings. Newry Gold is a beautiful golden orange colour, while noticeably paler than the typical scoparius is the form called sulphureus. Daisy Hill is a very distinct bicolor form now well known. Beside all these and one or two other scoparius forms, a large spray was included of the marvellously free Cytisus albus Profusion.

SAFETY FIRST

WEEDS that other killers can't shift are destroyed by **DYOWEED**. It gets down to the roots and no more weeds come. Non-Arsenical, safe, clean and goes twice as far as most. Insist on

DYOWEED

Obtainable from all seedsmen & stores from 1/6 to 10/6. Larger quantities in drums and barrels. In case of difficulty apply to

HAWKER & BOTWOOD LTD.
Grays, Essex

KILL those WEEDS!

You can destroy weeds with Weedicide—clear the garden paths, drives, etc., and do it quickly with the weedkiller that has been "commended" by the Royal Horticultural Society.

WEEDICIDE

1 Gall. (price 9/-) dilutes to 100 Galls. water, the cost of the ready-for-use weedkilling mixture is, therefore, just over 1d. per Gallon.

1 pt. tin 2/-, 1 qt. 3/3, ½ gall. 5/6.

OTHER COOPER SPECIALITIES.**FUNGICIDE.**

The IMPROVED Bordeaux Mixture for Potato Disease, Apple and Pear Scab and other fungoid diseases.

1 lb. tins 1/-, 5 lb. tins 3/6, 10 lb. 6/-.
Larger quantities at reduced rates.

TOMARITE.

Non-poisonous tomato spray for Tomatoes. Remedy and preventive of fungoid diseases of external origin. Does not mark the fruit.

1 gall. (price 14/6) makes 200 gallons of spray mixture. ½ pt. tins 1/8. 1 qt. 5/-.
Special prices for larger quantities.

CARROT AND ONION FLY DRESSING.

A Special Powder for minimising damage to growing crops from attack of the Fly.
1½ lb. packets 1/-, 7 lb. 2/-, 14 lb. bags 3/-, 56 lbs. 9/6, 112 lbs. 17/6.

The "ATCO" Turf Cultivator aerates roots, destroys plantains, daisies, etc., levels turf, loosens and collects moss, makes coarse grass fine. It can be affixed only to the "ATCO."

The most efficient Mower on Earth

DURING the mowing Seasons of 1921-22-23 the British public invested £262,500 in the purchase of 3,500 "ATCO" Motor Mowers. Prior to that period the majority of mowing was done by hand or horse mowers at a cost per annum sufficient to pay for an "ATCO" outright. Of these 3,500 "ATCO" owners not one, to our knowledge, has met with a mowing difficulty to which the "ATCO" is not equal.

THE "ATCO" LAWN EDGE TRIMMER

works with great speed and simplicity, giving a straight edge by the actual continuous "shears" action. Its efficiency and reliability have been perfected in actual use under all normal conditions.

PRICE:
57/6
delivered.

One owner writes that mowing which employed a gardener two full days is now done more efficiently in five hours with the "ATCO." At Cheddle Hulme an "ATCO" has just completed its second season without a single breakdown and without the owner having to spend a penny piece. A gardener with sufficient mowing to occupy a man and a boy six days with a push mower, now does the whole of his work in two days on less than a gallon of Petrol Mixture.

Send for Free Booklet offering FREE DEMONSTRATION on your own grass, and telling how the "ATCO" pays for itself in a year.

PRICES: 16 in. £50. 22 in. £75. 30 in. £95.

Less 5% Cash, 7 days. Cultivator extra.

ASK THE MAN WHO USES IT

NOW READY. A book every Golfer will want

PUTTING

By JACK WHITE.

With Prefatory Notes by J. H. Taylor, James Braid, Alex. Herd, George Duncan, and a Commentary by Bernard Darwin. Freely Illustrated.

4/6 net; by post 4/10.

Every Golfer who wishes to improve his game should read what Jack White has to say about the subtle art of Putting. He is acknowledged to be the best putter in the professional ranks, and his book is full of invaluable, match-winning tips, for it is on the green that matches are won—or lost.

Published at the Offices of "COUNTRY LIFE," LIMITED, 20, Tavistock Street, Covent Garden, W.C.2.

NICOTINE! NICOTINE! NICOTINE!

No Compound, poisonous or non-poisonous, is as effective or as safe as English-made Nicotine for destroying all sucking insects infesting vegetation. It cannot be bought in a more convenient form for spraying or syringing than as—

CAMPBELL'S NICO SOAP (Nicotine Soap). The best Potash Soft Soap plus 7½ per cent. Nicotine. A teaspoonful will make one gallon of strong spray fluid. Prices:—½ lb., 2/-; 1 lb., 4/-; 10 lb., 32/-.

CAMPBELL'S ENGLISH NICOTINE, 95-98 per cent. This is offered to large users or others preferring to make up their own fumigating and spraying compounds. Prices on application.

CAMPBELL'S NICOTINE VAPORISING COMPOUND. Nicotine content, 50 per cent. Prices:—10z., 1/6; 4oz., 3/9; 8oz., 7/6; ½ pint, 9/-; 1 pint, 17/6; ½ gallon, 61/-.

CAMPBELL'S NICOTINE FUMIGATING ROLLS, very simple and effective. In four sizes for 500, 1,000, 2,000 and 3,000 cubic feet. Prices:—7d., 10d., 1/6 and 2/- each.

CAMPBELL'S PATENT SULPHUR VAPORISER. The best method of exterminating Mildew from plants in greenhouses. In two sizes, for 5,000 and 10,000 cubic feet. Prices:—18/- and 20/- each.

Obtainable from Seedsmen, or, in case of difficulty, direct from the Manufacturer—

J. D. CAMPBELL, Nicotine Manufacturer,
5, LUND STREET, CORNBROOK, MANCHESTER.

"Auto-Shreds" did it!

I just burnt them on the ground and they thoroughly fumigated my plants. The judge wanted the name of the stuff that kept my flowers so insect-free. I told him "DARLINGTON'S AUTO-SHREDS." At all seedmen they cost
No. 1. (To fumigate 10,000 cubic feet.) For tender or ordinary plants, 6/-
No. 2. (10,000 c.f.) Ordinary plants, 4/6
No. 3. (1,000 c.f.) Ordinary or tender plants, 1/-
No. 4. (2,500 c.f.) do. 1/9

SUTTON'S SWEET WILLIAMS.

These beautiful flowers are now at their best, and remind us that provision should at once be made for next season's requirements.

We recommend flower lovers to try the following colour scheme:—Centre Giant White, then Pink, and finish off with a band of Scarlet.

The effect will be found most pleasing and quite unlike the old-fashioned Sweet Williams.

SUTTON'S GIANT WHITE - per packet, 1 6.
SUTTON'S SCARLET - " 2 6 & 1 6.
SUTTON'S PINK BEAUTY - " 2 6 & 1 6.

SUTTON & SONS, THE KING'S SEEDSMEN, READING.

Notes from Maidstone

STANDARD ROSES.

For the grower of Roses, May is a month of anxiety. Our standards made unusually early growth and a severe frost would have played havoc with them. The fates, however, were kind, and we can now rely upon a very fine bed of standards all on English Briar—and not Rugosa—a point which needs no emphasis to the wise rose grower.

George Bunyard & Co.,
Ltd.,
The Royal Nurseries,
Maidstone.

AN EXCELLENT BEDDING CATALOGUE

giving helpful information of the best BEDDING PLANTS, including Plants for Colour Schemes, Standards and Half Standards for Relief Bedding, moderately priced, has been issued by

The King's Acre Nurseries, Ltd
HEREFORD.

A copy will be sent to anyone applying for it, to the Nurseries, by post, and mentioning "The Garden."

Perpetual Flowering CARNATIONS

FOR THE GREENHOUSE AND THE GARDEN.

Catalogue Free on application.

C. ENGELMANN,

Carnation Grower, SAFFRON WALDEN, ESSEX.

Safeguard your plants and flowers

from the ravages of Green and Black Fly, Woolly Aphis, Mildew, etc., by early and regular sprayings with

Abol

Non - poisonous

Insecticide

1/2 pt. 1/4; pt. 2/2;
qt. 3/4; 1/2 gall.
5/3; gall. 9/6.

Abol is perfectly safe to use on all plants, fruits and vegetables. It invigorates the plant and refreshes the foliage. It is clean and wholesome to handle, has no unpleasant odour, and will not damage paintwork. An interesting book on Garden Pests will be sent to anyone, gratis and post free.

Abol Patent Syringes

give a perfect spray, which may be varied in density from fine to medium or coarse, as desired.

They are specially recommended by the National Rose Society, and have become widely known on account of their great

wearing qualities.

Many Abol Syringes have been in use for over 20 years.

[JUNE 16, 1923.]

THE LILACS, SPECIES AND VARIETIES

THE host of beautiful varieties of the Common Lilac are inclined to overshadow numerous species which are deserving of much more attention in our pleasure grounds and shrubbery borders. The introduction of several new Chinese Lilacs by Mr. E. H. Wilson and other recent travellers in China should serve to focus more attention on the family. All appear to be of similar culture to, and as easy to grow as, the Common Lilac. A larger percentage of cuttings can be rooted successfully in a close frame with slight bottom-heat than is usual with cuttings of the Common Lilac.

In May, which is the lilac-time of the poet, there is nothing more delightful in the garden. Not only have we a wealth of colour, but also delightful fragrance.

SYRINGA EMODI, the Himalayan Lilac, is a vigorous grower, forming a large bush with white or purple-tinted blossoms at their best in early June. The leaves are up to 7 ins. or 8 ins. long and half as wide. It belongs to the villosa group, but differs from that species most noticeably in the white under-surface of the leaves and the paler blossoms. Hybrids raised on the Continent between this species or *S. villosa* and the Common Lilac are interesting, and will no doubt be heard of in the future, but the Great War checked their development and dissemination. *S. Emodi variegata* with broadly margined golden yellow foliage is distinct and effective and forms vigorous-growing bushes.

S. JAPONICA, the Japanese Lilac, is valuable because of its late flowering, the white blossoms opening during the second half of June. Professor

Sargent records seeing wild specimens up to 30 ft. high; but with us 8 ft. to 10 ft., and as much in diameter, is the average size when growing as a lawn specimen.

S. JULIANÆ is a Western Chinese Lilac introduced by Mr. Wilson in 1900. It is a small-leaved species, suggesting also in flower the Persian Lilac, but is more vigorous than that species, forming a distinct stem. Round-headed bushes up to 6 ft. and eventually more in height are attractive on the lawn or in the shrubbery towards the end of May.

S. KOMAROWII is a vigorous bush with leaves up to 6 ins. or 7 ins. long and 3 ins. wide. The lilac pink blossoms are produced on a rather narrow inflorescence 5 ins. or 6 ins. long in closely packed whorls. It was introduced by Mr. Wilson in 1908 from Western Szechuen.

S. PERSICA is reputed to have been first introduced to Britain about 1640, and is still one of our most

treasured fragrant May-flowering garden shrub. The name of Persian Lilac was no doubt given because it was so well known in that country. All the evidence now available, however, points to China as its native home, wild specimens of a Lilac collected on the hillsides in Kansu being identical with *S. persica*. In common with several other Chinese plants travellers no doubt brought it westward centuries ago when trading with that Oriental empire. In addition to the form with fragrant lilac blossoms, there is a pure white variety *alba* and *laciniata* with five to nine lobed leaves.

S. PINNATIFOLIA.—This very distinct pinnate-leaved Lilac was first introduced by Mr. Wilson in 1904. It is an interesting plant for the border of choice shrubs. The pale lilac-tinted blossoms are borne in May. Even when not in flower the elegant foliage arrests attention.

S. POTANINI is another of the group with smallish leaves and blossoms. It is a native of Western Szechuen and Kansu, ultimately forming a bush 12 ft. or more in height. The rosy-purple blossoms are freely borne in May.

S. REFLEXA appears to be the most distinct and promising of the new Chinese Lilacs. It is a free-growing bush and ultimately to attain a height of 12 ft. to 15 ft. or more, with leaves 4 ins. to 5 ins. long and half as wide. The flowers are densely packed in narrow cylindric inflorescences 5 ins. or 6 ins. long and 2 ins. wide. The inflorescence is borne at the ends of the shoots, and is distinctly arching or even pendent, dark rose in colour in the bud-state, opening to a lighter shade. It was discovered and introduced by Mr. Wilson, who found it in Western China.

LILAC-TIME AT KEW.

WHITE LILAC MARIE LEGRAYE.
One of the best for forcing.

NEW LILAC PRINCESS CLEMENTINE.
Claimed to be an improved *Madame Lemoine*.

S. SARGENTIANA is allied to *S. Komarovii*, and in the last volume of "*Plante Wilsoniana*" is placed as a variety of that species. Seeds were collected by Mr. Wilson in Western Szechuen in November, 1910. The flowers are rosy or reddish purple.

S. TOMENTELLA is at present better known in British gardens as *S. Wilsoni*. Dried wild specimens shewed *S. tomentella* to have a pubescent under-surface to the leaves and inflorescence, as distinct from the slightly hairy *S. Wilsoni*, but under cultivation these differences do not hold good. It is quite the best of the robust-growing newer Chinese Lilacs, forming a large bush up to 12 ft. or, with age, probably more in height and wide in proportion. The largest leaves are 5 ins. long and 2½ ins. wide. The large, open inflorescences are 6 ins. to 7 ins. long by 4 ins. or 5 ins. wide with delicate pale rose blossoms which are at their best towards the end of May and in early June. *S. tomentella* is a good town shrub, one of the best bushes I know being in a small front garden in Camberwell.

S. VILLOSA is another Lilac with several synonyms, including *S. Bretschneideri*, figured in the *Botanical Magazine*, t. 6, 8292, and distributed by M. Lemoine, also *S. Emodi* var. *rosea*. It forms a large vigorous-looking bush 12 ft. or more high and broad, producing towards the end of May and early in June large terminal and axillary inflorescences of rosy lilac blossoms. It is a native of Northern China, and should find a place in the best six species of *Syringa* for the pleasure grounds.

S. YUNNANENSIS promises to be a distinct Lilac, flowering at the end of May and early June. It is readily distinguished by its rather smaller red-stalked leaves, which have a distinct whitish under-surface. The inflorescence is narrower and more elegant when compared with *S. tomentella* (*S. Wilsoni*).

From these notes it will be apparent that Mr. Wilson, during his several journeys to China, more than doubled the number of species of *Syringa* cultivated in our gardens. The latest "*Arnold Arboretum Bulletin*," New Series, Vol. IX., No. 5, states that twenty-seven species are in cultivation in America. This includes three new species from Korea—*S. dilatata*, *S. formosissima* and *S. velutina*.

Were I asked to select the best four of the newer species for garden decoration, my choice would be *S. tomentella* (syn. *S. Wilsoni*), *S. reflexa*, *S. Julianae* and *S. yunnanensis*.

The first hybrid Lilac is reputed to be *Syringa chinensis*, which appeared in the Ronen Botanic Gardens in 1810, the result of a cross between *S. vulgaris* and *S. persica*. It is still one of our best Lilacs for the pleasure grounds, forming a large shapely bush 8 ft. or 10 ft. high, covered in May with lilac-coloured blossoms. The name *S. chinensis* was given because of its, at first, reputed Chinese origin.

The raising of the present-day race of garden Lilacs is of much more recent date. In 1843 a Liège (Belgium) nurseryman raised *S. vulgaris azurea plena*, which is said to have been used by M. Lemoine when he commenced raising the wonderful series of hybrids which have emanated from Nancy, the fame of which is now world wide.

THE COMMON LILACS.

Among our larger-growing flowering shrubs none is more popular or more worthy of attention in our gardens than the varieties of *Syringa vulgaris*. While the cultivation of the Lilacs presents no problems to the enthusiast, in very many gardens they receive scant attention in regard to tillage of the soil and pruning, without which the bushes cannot give of their best.

While the shrubbery border is the home of many Lilacs, they are also equally valuable for massing in large beds and as single lawn specimens. Sunny positions should be selected and in cold districts shelter from the north and east is desirable. A medium loam, trenched 1½ ft. to 2 ft. deep, is the ideal soil for Lilacs. Plenty of old builders' rubble should be added to heavy ground, and liberal dressings of cow manure to light soils.

In planting give the bushes ample space to develop, as it is to mature, well ripened wood that we must look for the best trusses of flowers. It may be necessary once in a way, if the bushes become tall and leggy, to sacrifice a season's flowering and cut the branches well back into the old wood early in April. The best and most satisfactory form of pruning, however, is to cut out the old inflorescences as soon as they fade, removing at the same time weak growth and thinning crowded young shoots. This should be followed immediately by a mulching of well rotted manure.

Lilacs are readily propagated by layering and cuttings. Grafting is favoured by some growers (more especially on the Continent), using the Common Lilac and Privet as stocks.

A representative collection of the best named Lilacs should include the following twenty sorts:

Single.—*Alba grandiflora* and *Marie Legraye*, white; *Charles X.*, rosy purple; *Congo*, red; *L'Oncle Tom*, dark crimson; *Lucie Ballet*, flesh; *Mme. Françoise Morel*, violaceous pink; *Princess Marie*, pinkish lilac; *Souvenir de L. Spath*, deep purple; *Foussant Louverture*, light red.

Double.—*Alphonse Lavalée*, bluish violet; *Charles Joly*, dark red; *Condorcet*, semi-double lavender blue; *Mme. Abel Chatenay* and *Mme. Lemoine*, white; *Mme. Casimir Perier*, creamy white; *Michael Buchner*, rosy lilac; *President Grey*, lilac; *President Carnot*, pale lilac; *William Robinson*, violet mauve.

A. O.

SHRUBS FOR DRY BANKS

THERE are few subjects which more bewilder the amateur gardener than the furnishing of a poor, hungry bank. Such banks seem usually to obtrude themselves where it is essential that something be done to furnish them. It is commonly advised to remove the hungry soil and replace by good. Such a course does not, however, eliminate the droughty conditions, and if tree roots, for instance, hold the bank together, the advice is feasible only to a very limited extent.

Given adequate attention the first summer after planting—this is essential—there is, fortunately, quite a number of flowering shrubs which will make themselves at home in poor soil and under droughty conditions.

None of these is better for the purpose than the various species and varieties of Gorse. The double-flowered form of the common Gorse—*Ulex europæus* fl. pl.—is preferable to the typical plant as an ornamental shrub, because its almost

bruising, gives off a pleasing resinous odour. This is about the only *Cistus* which moves tolerably well from the open ground. *Cistus cyprius* is the plant almost always cultivated in gardens as *C. ladaniferus*. The plant has the eucalyptus-like odour of the latter species, but is actually intermediate in character between the true Gum *Cistus* and *C. laurifolius*. It has brownish red blotches at the base of the petals, which blotches are a feature of *C. ladaniferus*, and the foliage, too, "favours" that plant more than *C. laurifolius*, also the blossoms resemble *C. ladaniferus* in shape, being flatter and of stouter texture than in the other species, but borne in clusters. On dry soils this species is unlikely to suffer even in the Midland Counties, during nine winters in every decade.

The true Gum *Cistus*, *C. ladaniferus*, which is smaller growing than *C. cyprius*, is also more tender, and the same may be said of the beautiful *C. purpureus*, which has rosy purple flowers with

petals, is less hardy. The small-growing, white-flowered *H. umbellatum*, with distinct rosemary-like foliage, should also be included.

The true species of *Cistus* and *Helianthemum* are readily increased by seeds, but of the hybrids cuttings are more reliable. Cuttings of the half-ripe wood of the non-resinous species root very readily under glass, and it is wise always to have a few young plants in a frame in case a severe winter plays havoc.

MELON AND CUCUMBER CULTURE

WITHOUT liberal fire heat it is not possible, successfully, to grow Melons and Cucumbers during the winter, or even early spring months. From the middle of May and throughout summer and early autumn they may be grown inexpensively either in glass-houses or on beds in frames.

The seeds of both Melons and Cucumbers are very fleshy, and, in an uncongenial soil they quickly decay. If the soil is warm and moderately moist the seeds germinate in about four days time. A rather lighter soil should be used for Cucumbers than for Melons from the seedling to the ripening stage. It is best to sow one seed in a small pot and to place the seed with its point straight down in the soil; the new growth then pushes through the soil in the form of a swan's neck and head, and keeps its centre free from soil; if the seed be sown point upwards the seed leaves push through the soil in an open form like the swan's beak open so that soil collects between the leaves and often causes the young plant to rot off. The soil for the seeds should be in a medium state of moisture. Water will not then be required before the seedlings are quite clear of the surface soil and so less liable to damping-off.

A rather strong, retentive loam is the most suitable for Melons, and neither sand, manure nor leaf soil should be added to it. Cucumbers thrive best in a much lighter loam mixed with an equal quantity of leaf soil and a fifth part of rotted manure. Furthermore, the rooting medium for Melons must be firm, while that for Cucumbers should be looser.

Melon plants like plenty of sunshine, while Cucumbers do best if very lightly shaded during the hottest part of the day. This is especially necessary after several dull days.

Cucumbers will need more water than Melons. In either case the depth of soil at first should be 6 ins. and as the roots appear on the surface they should be lightly covered with a rich compost. When the fruits are swelling freely, feed liberally with diluted manure water and judiciously with artificials. The Melons may be grown as cordons planted 15 ins. apart. Indeed, I strongly recommend this method. Cut the fruits of Cucumbers while young and keep the plants from being overburdened; they will then continue to bear for a longer period.

Ventilate the structures a little early in the day and gradually increase the amount of air to the house or frame. Maintain a moist atmosphere while the weather is fine and bright, and much less moisture in dull weather. Syringe Melons and Cucumbers when closing the structure on fine afternoons, but cease syringing and also lessen atmospheric moisture generally, in the case of Melons when the fruits begin to ripen. Very little water will be needed at the roots of the Melons during the maturing process and nice currents of warm air passing through the structure will add flavour to the fruits.

GEORGE GARNER.

A ROSY PURPLE ROCK ROSE, *CISTUS CRISPUS*.

overpoweringly fragrant blossoms last much longer in good condition. The Dwarf Gorse, *Ulex nanus*, is more erect in habit than Common Gorse and the growths more slender. It is ornamental, does best in poor soil and is exceedingly valuable because its main flowering is in autumn. *U. Gallii* resembles in some ways both *U. europæus* and *nanus*, being indeed almost intermediate between them. It is autumn flowering. Only hardy in the more favoured parts of Britain, it is none the less a native, and will be familiar to many who have toured Southern and South-Western England in autumn.

All shrubs for dry banks should be moved small and from pots. This applies with special force to all forms of Gorse. The sunnier the bank the better these plants will flower.

All the Rock and Sun Roses are emphatically plants for dry, sun-parched banks. Many of them are, alas! not over-hardy, but they will all stand many more degrees of frost under such conditions than would prove fatal in richer soil. The hardest of all is *Cistus laurifolius*, which is, indeed, hardy in almost every district. This is rather dark-foliaged and "dour" when out of flower, but the white blossoms are very freely borne in clusters, and the foliage, even without

the same brownish red base, but these are hardier than many of the Rock Roses. Of about equal hardness is the white *C. populifolius*, a large-leaved species and quite distinct from any other *Cistus* in cultivation.

The Sage-leaved *Cistus*, *C. salvifolius*, is, for some strange reason, one much planted, but it has no special beauty to commend it beyond others, and it is, in the writer's experience, one of the least hardy. The rosy purple *C. crispus* is, if anything, hardier, so is the even more beautiful *C. villosus* with rosy blossoms, but the form of *C. crispus* called Sunset seems hardier as well as more beautiful than either. Hardier still is *C. corbariensis*, a splendid white-flowered form said to be a hybrid between *CC. populifolius* and *salvifolius*. *Cistus Loreti*, perhaps better known in gardens as *C. lusitanicus*, is another hybrid of *C. ladaniferus*. It is hardier than most, a neat, compact grower with crimson-blotched white flowers which remain open all the afternoon; too many *Cistuses* shed their blossoms about midday.

Many of the taller-growing *Helianthemums* are still called *Cistuses* in gardens. *H. formosum*, yellow, with brown blotches, is one of the best and hardiest. *H. alyssoides*, with unspotted

HARDY TERRESTRIAL ORCHIDS

I HAD lately a visit at Florare from a good English alpine plant grower who saw our orchid-bed and said to me, "We are unable to cultivate these in England." This is quite an error, and I easily proved to him that some of the best hardy Orchid cultures are in his country. Yet, of course, they are not so numerous as they might be. *Cypripediums* are the one genus really popular with amateurs, but the *Orchis*, *Ophrys*, *Scorpias*, *Spiranthes*, etc., are seldom grown. The reason is simply that people fail to treat these Orchids as tuberous plants, which they are, and so transplant them direct from the wild into the garden without giving them time to mature their tubers.

Of course, *Orchis* flowers are less vivid than those of *Daffodils*, *Tulips* and *Hyaacinths*, but they have other charms not to be despised. See those, for instance, which for the most part are easily cultivated when planted in lawns or meadows where the grass forms a protection for their roots; the herbage furnishes their flowers with a very attractive setting, and they bring brightness and colour to the green carpet. There are a dozen species in Great Britain; the whole of Europe contains more than a hundred different kinds and a great many varieties or hybrids. The French botanist Camus has published a large Iconography ("Iconographie des Orchidées d'Europe," Paris, 1921) of them, and particularly of the hybrids and varieties; this contains 122 large plates each shewing on an average eight different types. In my own Iconography, "Album des Orchidées

d'Europe," published thirty years ago, I gave sixty plates of the most important European kinds, and in the new one now being published six more, yet there are shewn only typical species and those which are most characteristic. It would be easy to enlarge that list with the hybrids and varieties, and still easier if Oriental kinds were admitted. In Asia Minor and in North Africa the regions bordering on the Mediterranean contain about twenty-five other species of real interest. I should estimate that there are altogether more than sixty species of Orchids which are, or might be made, more or less hardy in England.

The cold and temperate countries of the five continents make their contribution to our gardens as well in Orchids as in other groups of plants. North America sends us quite a collection: *Aplectrum hyemale*, *Arethusa bulbosa* (a dear little thing for moist ground), *Cypripedium acule* and *CC. arietinum*, *californicum*, *candidum*, *fasciculatum*, *montanum*, *occidentale*, *parviflorum*, *passerinum*, *pubescens* and *spectabile* (or *Regina*); *Epipactis gigantea*, which is a gigantic palustris; *Goodyera Menziesii* and *GG. pubescens* and *tessellata*; *Gymnadenia conica* and *GG. flava*, *nivea* and *tridentata*; *Liparis liliifolia*; *Microstylis diphylla*; *Platanthera* (or, better, *Habenaria*) *blepharoglossis* and *chata*, a beauty with orange flowers and *PP. dilata*, *umbriata*, *crispa*, *flava*, *fissa*, *fragrans*, *herbiola*, *grandiflora*, *Hookeriana*, *meisa*, *lucida*, *leucophæa*, *peramona*, *psychodes* and *verticillata*; *Pogonia ophioglossoides* and

P. verticillata; *Spiranthes cernua* (near to the rare *Romanzoffiana*) and *SS. gracilis*, *latifolia* and *Unalakensis*; *Tipularia discolor*, etc.

The temperate Asiatic regions give us *Bletia hyacinthina* of Japan, which is an exquisite plant for the bog garden and its white variety; *Cypripedium debile* and *CC. Franchetti*, *guttatum*, *himalaicum*, *japonicum*, *luteum*, *macranthum* (found in Eastern Europe also—so is *guttatum*), *speciosum*, *tibeticum* and *ventricosum*—the last one being a beauty introduced by the firm of Regel and Kesselring in different shades of colouring and height—*Yata beyanum*, etc.

South Africa has sent us a lot of lovely things which are, alas! not hardy here, but do well in the South of England (*Disa*, *Satyrion*, *Eulophia*, etc.).

One can safely state that the list of hardy terrestrial Orchids is rather a long one, and the amateur who likes these treasures has a big field to study. Some are suitable for grass-land and may be planted in the sward just as we do *Narcissi* and other bulbous plants. Others are for the bog or for shady woodland, some are for the rockery and many can be grown in pots or pans and treated as one does bulbous plants.

The Rev. Wolley Dod had, some forty years ago, a very important collection at Edge Hall, and wrote me enthusiastically about them. My late friend G. F. Wilson, when he established his garden at Wisley (Oakwood), spoke to me often of his desire to have there the whole lot of hardy Orchids (see for more details "Orchidées Rustiques," by H. Correvon, pages 199 and 204). He began with *O. foliosa* of Madeira, then introduced all

A GROUP OF THE HYBRID ORCHIS FOLIOSA MACULATA
AT SCAMPSTON HALL.

ONE OF THE MOST POPULAR OF HARDY ORCHISES,
O. LATIFOLIA.

THE RARE CALYPSO BOREALIS AT SCAMPSTON HALL.

the English species and later he planted *Ophryses*, *Aceras*, etc., in the driest places.

Last year I saw at Brockhurst, at Cuckfield and elsewhere some terrestrial Orchids in great beauty. The best lot I ever saw, however, is the collection of Mr. St. Quintin at Scampston Hall, near Rillington. I well believe that this clever alpine-plant grower has every one of the terrestrial Orchids which may be grown in England.

The groundwork of this collection is *Orchis foliosa*, of which the big spikes surpass all other kinds. Mixed with it are *OO. latifolia*, *incarnata*, *maculata* and *mascula*, *Gymnadenia conopsea*, etc., which have interbred and crossed also with *foliosa*, forming a very remarkable collection of hybrids. There is in that corner of the garden the most extraordinary picture a lover of the Orchises could wish to see. Near to these Mr. Quintin grows the round-tubed kinds, such as *militaris*, *mascula*, *Morio* and *coriophora*, which like moist but not quite boggy soil. The whole is a sort of slightly damp plateau with, maybe, a little peat in it. The rock garden itself, which surrounds the whole, is rich in alpine mixed with mountain Orchids: *OO. globosa*, *sambucina* and *pallens*, *Hermidium Monorchis*, *Gymnadenia odoratissima* and *G. albida* (a tender plant which always grows among *Rhododendrons* or *Ericas*), *Nigritellas*, *Epipactuses*, etc.

In some pans under glass Mr. St. Quintin had *Calypto borealis* flowering beautifully, *Listera cordata* (a difficult little plant from the dark woods), *Goodyera repens* and *Spiranthes Romanzoffiana*, the rarest of European Orchids, of which he had many flowering sets. On the driest slopes of the rock garden he grows (as well as in pots) *Ophryses* in different kinds (some of them he brought from Hyères), *Anacamptis pyramidalis*, *Aceras anthropophora*, *Barlia longibracteata*, *Cephalanthera*, even the rare and tender *rubra* which flowered with him; *Celoglossum viride*, *Orchis Simia*, *O. tridentata*, *O. ustulata* and different *Serapias* from the South.

In shady spots the *Cypripediums* (quite a collection), the *Platantheras* or *Habenarias*, etc. Then,

too, a large lot of exotic species are grown under special conditions, each species being carefully nursed and tended. H. CORREYON.

(To be continued)

FRAGRANT FOLIAGE—III

OF strictly herbaceous labiates with foliage more or less fragrant, one of the most numerous and important families is that of the Mints, many of which (*Spearmint*, *Peppermint*, *Water Mint*, *Field Mint*, etc.) belong to our native flora, though two of the most desirable for the garden—*Mentha Pulegium* var. *gibbaltaria* and *M. Requienii*—are exotics. *M. gibbaltaria* (*Penny-royal*), besides being strongly and pleasantly fragrant, is valuable for carpeting purposes, being a low-creeping and stem-rooting form with foliage of a cheerful green. Native, however, to the South

of Europe, it is, as might be expected, doubtfully hardy in most of our gardens, though I have wintered it in my own for several seasons, not, however, without sometimes coming near to losing it. This *Penny-royal*, as the varietal name indicates, is no doubt a native of Spain, but it belongs also to the flora of Calabria, where the peasantry regard it with veneration as sacred to the Virgin, so that they will not wittingly pass a patch of it without inhaling its perfume and muttering a pious *ave*, an observance due to a belief popularly expressed in an Italian couplet, which may be freely translated—

"Who sees this herb and savours not its breath
He finds not Jesus in the hour of death."

M. Requienii (*Corsican Mint*), which hails from much the same latitude as the *Penny-royal*, is surely the most diminutive of flowering plants, unless perhaps *Veronica canescens* be a rival for this lowly pre-eminence. No one who has a slab-paved garden-path and wishes when he walks upon it to press perfume from its joints will fail to grow in quantity this sweet and interesting little Mint. Were I commissioned to plan a garden for the blind, I should take care to tread it with walks of *Corsican Mint* and *Penny-royal*; which thought may have been in a mind many multiples greater than mine, when, some three centuries ago, it observed: "Of Bean flowers I speak not, because they are field flowers. But those which perfume the air most delightfully, not passed by as the rest, but being trodden upon and crushed, are three, that is, *Burnet*, *Wild Thyme* and *Water Mints*. Therefore you are to set whole alleys of them, to have the pleasure when you walk or tread." Precisely: and there you have in a nutshell a garden for the blind.

The only Mint, other than the two already mentioned, that I grow in my own flower garden is *Mentha rotundifolia*, the variegated variety, though the variegation, of a soft ivory white and pretty as far as it goes, is uncertain and capricious. Still, apart from its variegation and its scent, this Mint is worth growing for its apple

green and the downy texture of its foliage. Botany books give this plant as native to Britain, but I have never found it wild, and where it seems to be a wilding I suspect it is but a garden escape. I seem to remember from long ago a form of this plant which was called by those who grew it as a window plant, "*Apple Balm*." There was no variegation, and the whole plant, leaf and branch, was of a more slender habit than the variegated form, while the scent had more of the *Lemon* and less of the *Mint*. Such flotsam of the memory, I am quite aware, is not always to be trusted or taken for what it seems. Still, I should be glad to learn from anyone able to inform me whether the *Apple Balm* so real to my memory has, or ever had, any existence in fact. Also I would ask readers of *THE GARDEN* whether they grow or know, or know anyone who grows or knows, *Mentha citrata*, a *Mint* said to be native to Wales and Cheshire and to smell of *Bergamot*, for which reason it is called "*Bergamot*" *Mint*.

For those who value sweet-smelling foliage the *Garden Balm* (*Melissa*) needs no bush. I got my own original plant of variegated *Melissa* years ago from a stall in Covent Garden, and an excellent plant it has proved itself to be—ideal for those who like variegated foliage—the streaking and fringing of warm yellow being both abundant and regularly laid on. My borders, sometimes in quite unexpected places, are dotted with sporadic colonies of seedling *Melissas*, shewing no trace of variegation, though they are all the progeny of the Covent Garden variegated form. They are weeds undoubtedly, having no business to be where they are, but such weeds one gladly suffers. Here, again, I would ask for information from anyone who has it to give and will be kind enough to give it. Is there not another sweet-scented *Melissa* besides *M. officinalis*: a plant of low stature (perhaps 3 ins. or 4 ins.) with leaves much like those of *officinalis*, but coarser, of a darker green and somewhat curled—the scent stronger and with more *lemon* in it than that of the ordinary kind—the whole plant much less luxuriant than the other, less easily grown and propagated and extremely shy of flowering, which the typical form, unfortunately, is not? I am inclined to think that this may be the *Melissa Romana* of old Philip Miller, described as *mollis hirsuta et graveolens*; though he adds a translation of *graveolens* which would indicate something very different from the delightful *lemon* perfume in my memory.

The *Bergamots* (*Monarda*) take a high place among the fragrant herbs. I grow, myself, several varieties, white, purple, etc., but I really think that, except for those whom Miller calls "the curious" in garden matters, the handsome scarlet variety called the *Cambridge Bergamot* sums up in itself the virtues of its race, a fine bold habit, flowers of a rich glowing colour and handsome leaves of a delicate perfume. Seeing that the *Monarda* is a native of Canada (it is called *Oswego Tea*) extremes of temperature should have no terrors for the plant, and yet the English winter seems to try it, though more from its damp, I fancy, than from its cold.

Of the *Marjorams* I know only the common sort (*Origanum vulgare*) in two varieties. The typical wild variety may be consigned to the pot-herb plot; but the *aureum* variety, because of its dwarf, compact habit and its foliage of

bright feverish yellow, may be grown with advantage where edgings or sweet pavement plants are desired. Further, it is easily managed, coming up bravely from year to year without transplanting and keeping well to its own quarters, without molesting its neighbours.

Last, but far from least, in my list of aromatics comes the Balm of Gilead (*Cedronella triphylla*). There are two *Cedronellas* of my acquaintance; *Cedronella cana* belongs to the New World and,

though I grow it, is in my opinion not worth growing except by the "curious," having no great beauty of form or colour and a fragrance which, though aromatic, is not particularly sweet. *Triphylla*, on the other hand, though not much to look at, has a delightful perfume, in quality like that of Bergamot, but as strong as the fragrance of the scented *Verbena*. This Balm, coming from the Canaries, is not absolutely winter proof in this country, though not so tender as one might suppose.

I once had a garden, and not a very warm garden either, where it grew, like the *Melissa*, as a chartered weed, and where a handful of its foliage, plucked in the passing, used to be my scent bottle. At the present moment, however, I am sorry to think that there is no Balm in my Gilead, though I intend to establish it there as soon as may be, either with protection or without. As for Bacon's Burnet, what is Burnet?

SOMER.

[*Poterium Sanguisorba* most call Burnet.—Etc.]

HARDY PRIMULAS

Of the Muscarioides and Soldanelloides Sections

THESE two sections are very similar in habit and appearance, and there is a natural merging of one into the other, so that they might well be dealt with together. The characteristic feature of the members of this group is the aggregation of small or large flowers in a compact head or spike. Generally, the flowers are sessile, or have short pedicels; while the corollas are deflexed or drooping in most species. With the exception of *P. bellidifolia*, all the members of the muscarioid group are natives of Western China, while all the best-known species in the other come from the Himalayas.

They are nearly all plants of the woodland, with softly hairy leaves, a character which denotes that they are liable to suffer from the dampness of our winters. So far, several of the Chinese kinds have proved hardy, which is more than

one can say of some of the Himalayan species, like *P. Reishi* and *P. Wattii*. All are best treated as biennials, raised from seed in a little heat in spring, pricked out into boxes or pans as soon as they are large enough, and planted out in the early autumn in the places where they are to flower. A cool, shady position should be selected, where they never get the full rays of the sun, while the soil should be deeply worked and of a loamy nature, with plenty of leaf-soil and sharp sand.

In addition to the following kinds which have been, or are, in cultivation at the present time, there are other known species in both the Himalayas and West China which belong to these groups and which have yet to be introduced to our gardens.

P. CRISTATA.—This species was originally found by the Abbe Delavay in Yunnan in the year 1880,

but was not introduced till Forrest found it in Eastern Tibet and South-Western China. It is closely allied to *P. Giraldiana*, with rosettes of softly hairy leaves having entire margins. The stems rise to a height of 1ft. to 1½ft., bearing a head of violet-blue flowers in May.

P. COXICA.—In the year 1915 this species was found by Forrest in Yunnan. The leaves are produced in tufts, thin in texture, and pale green in colour and softly hairy all over. The stems which are not mealy, reach to a height of 18ins., and bear heads of pale lilac and sometimes nearly white flowers in May.

P. DEFLEXA.—This was the first of the group to come into cultivation, and is one of the most fragrant of them all, as well as being one of the most hardy kinds. Seeds were sent home by Wilson, and plants flowered with Messrs. Veitch

THE DEEP LAVENDER PRIMULA NUTANS.

THE BEAUTIFUL PRIMULA SPICATA—CHINA BLUE, SILVERED.

in May, 1900. It was also, later on, found by Forrest. *P. deflexa* grows in the mountain woods of Western China at elevations between 10,000ft. and 13,000ft., and is closely allied to *P. cernua*, but is distinguished from that species by the longer and distinctly toothed leaves, longer petioles and smaller flowers. It is also near to *P. Giraladiana*, but differs from that plant in having obtuse or emarginate lobes to the calyx, which is covered with pale yellow meal at the base. The purplish blue, fragrant flowers are borne in compact heads on stems 1ft. or more high in May.

P. GIRALDIANA (syn. *P. muscarioides*).—Closely allied to the above, which has, however, fewer and larger flowers than this plant. It differs also in having acute calyx lobes. It was one of Forrest's finds on the Wild Yak Pass, on the dividing range of mountains between the Yangtze Valley and the Chungtien plateau. He came across it in 1904 at an altitude of between 14,000ft. and 15,000ft., growing in moist, open pastures on the margins of Pine forests. The leaves have crenate margins and are fringed with soft hairs, while the stems reach a height of 12ins. or more and bear heads of dark violet blue flowers in May.

P. LITTONIANA.—The most remarkable and interesting member of the section, this species was found by Forrest in "open mountain meadows

on the range forming the eastern boundary of the Lichiang Valley in Yunnan," at an elevation of 10,000ft. to 11,000ft. It was first introduced into cultivation by Bees, Limited. During the first season from seed it produces a tuft of greyish green, hairy leaves; these in the autumn die off, and a resting bud is formed for the winter. Later than most others in spring it commences growth, sending up in June from the tuft of leaves a scape 1ft. to 2ft. long, coated with white meal and ending in a dense spike like that of a *Kniphofia*. This is often 5ins. or more long, with the bracts and calyces of a bright red colour, or almost scarlet, contrasting with the drooping purple flowers. It is quite hardy in suitable situations, and produces plenty of seed.

P. PINNATIFIDA (syn. *P. nensis*).—This, like most of the above, was first discovered by the Abbé Delavay in 1886 on the Lichiang range at an altitude of 11,000ft. to 12,000ft., just along the base of the great glacier. Here Forrest found it, and says it is a charming hardy alpine, appearing soon after the melting of the snow, carpeting large tracts of alpine meadows. It has a great range of altitude, and while those on the lower slopes averaged 7ins. to 9ins. in height, forms were met with higher up only 2ins. high. The former have pale purplish blue flowers in large heads, while the dwarfier forms have smaller heads of larger flowers of a deep Tyrian purple. As its name denotes, the leaves are deeply cut or pinnatifid.

It is quite hardy, and comes into flower early in May, the two forms retaining their habit when growing together under similar conditions.

P. WARSONI.—Wilson found this species in Western Szechuen in 1903, and it was raised from seed and flowered by Messrs. Veitch and Sons.

THE VIVID SCARLET AND SOFT PURPLE PRIMULA LITTONIANA.

A woodland plant, it has leaves like *P. deflexa*, with slightly toothed margins and mealy stems 1ft. to 1½ft. long, bearing long heads of small dark purplish flowers in May. It is one of the least desirable species.

P. NUTANS.—Of the Soldanelloid section, this also was first discovered by the Abbé Delavay in woodland pastures at high elevations in Yunnan. Forrest also found it and sent home seeds to Mr. J. C. Williams, from which plants were raised and flowered in May, 1916. It is a beautiful species, with thin, toothed, softly hairy leaves in tufts. The large, fragrant, drooping, lavender blue coloured flowers are borne in dense heads on white mealy stems 6ins. to 9ins. high in May and June. This plant likes a well drained situation, and has done well in the rock garden, flowering freely. Damp or stagnant moisture of any kind is fatal near the crowns during winter.

P. SPICATA.—Also of the Soldanelloid group, this is a charming little Primula, seeds of which were sent home by Forrest. He found it at 11,000ft. elevation in 1906 growing on slopes and ledges of cliffs on the flank of the Tali range in Yunnan. The bright blue, fragrant flowers are borne in loose spikes on slender stems 4ins. to 6ins. high. It has not proved very amenable to cultivation, neither does it always produce seed unless hand fertilised.

All the above are Chinese plants, but from the Himalayas we have several beautiful members

belonging to the same groups. One of the best known is *P. REIDII*, a high alpine plant of the Western Himalaya, at an elevation of 12,000ft. to 13,000ft. It has densely hairy leaves, and heads of creamy white flowers on mealy stems 2ins. to 3ins. high. Although a perennial, it is best treated as a biennial, and it must be given the protection of a cold frame or even greenhouse.

P. HARKOVIANA is a more recent acquisition from Bhotan, where it was found by Mr. Cooper (collecting on behalf of Mr. A. K. Bulley) in 1915. It bears a great resemblance to the above species, but the leaves are not so thickly covered with white silky hairs. It is a low-growing plant with tufts of bright green leaves having crenate margins, with flower-stems 4ins. high, mealy, bearing a closely packed head of pure white flowers. The blooms are about half an inch in diameter with the edges of the corolla fringed. It has proved quite hardy, and can be propagated both by means of seeds and division. *P. SAPPHIRINA* is a low-growing plant with sapphire blue flowers, probably not now in cultivation. *P. UNIFLORA* is remarkable for producing only one, or at most two, large pale lilac flowers on stalks 2ins. to 3ins. high. The leaves are small and deeply toothed. It comes from the Sikkim Himalayas at high altitudes, 13,000ft. to 14,000ft., and is difficult to keep. Last comes *P. WATTII*, which might be described as a purple-flowered *P. Reidii*. It is also one of the high Himalayan plants and difficult to keep in this country. All the above Himalayan species belong to the Soldanelloid group, the only representative of the other section being *P. BELLIDIFOLIA*, which is in habit somewhat like the Chinese *P. deflexa*, but with more compact rosettes of shorter leaves and heads of violet blue flowers. This is probably the hardest of all, and may be increased by means of division as well as by seeds. W. I.

BUSH APPLE AND PEAR TREES

Their Treatment in Summer.

IN my rambles during the spring I often see formal fruit trees in gardens with nothing besides their symmetry to recommend them. They look as if they had been kept clipped with hedge shears for a number of years, and when they do bear fruit it is not as good as it should be.

To grow small fruit trees is a most delightful occupation, and it is possible to obtain fruit from them of the very best quality year after year unless the weather happens to be unpropitious at flowering-time. Supposing we have some of these which have become dense bushes to deal with in the autumn. After the fruit is gathered and before the leaves have fallen, we should apply the knife and pruning saw unmercifully till we can see half way through the tree in any position. A real expert can tell how much to cut away when the trees are bare, but it is not so with the beginner. It looks to him when the tree is properly pruned as if there was little or nothing left. Do not imagine that I would treat a tree which had been properly tended with such barbarity, but it is difficult to find any such outside a nursery, and during the last six or seven years, from unpreventable causes, they have not been too plentiful there.

Having brought the trees into such a condition that when leaves are produced most of them can obtain light, we have to consider what to do next. They are frequently allowed to produce shoots

half a yard in length, and then what is called summer pruning is practised on them. This so-called summer pruning is frequently delayed till very near the autumn, when they are mercilessly cut back. The prunings make nice stakes for Carnations, but that should not be the object of growing the trees. The shoots are frequently cut back so close that the lower eyes, which should remain dormant, become excited, and often break out into actual growth, and the leaves on the new growths remain green till the frost cuts them off. We have to consider that the embryo flowers commence to be formed in the buds very early during one season for producing fruit the following year, and that light and air without too much excitement or too much of a check are necessary to produce perfect results.

Left to itself, a vigorous young tree will make long growths at the expense of the lower eyes. We should endeavour to curb such growths just sufficiently to allow the buds at their base to become perfectly developed without being excited into premature growth, and these buds should also be ripened thoroughly by the autumn. This can be done by merely taking the points out of the shoots at the end of May or beginning of June according to the season, and afterwards pulling off all growths as soon as they appear on the ends of such shoots. Any weakly shoots required for furnishing the tree should be allowed to extend for a week or two after the strong ones are stopped, and with the extra vigour transferred into them they will speedily become stronger. Other weakly ones which are not required should be cut clean out.

If one had the time and inclination, probably the best results would be obtained by early disbudding, thus preventing all unnecessary growths, as we do with Peaches and Vines. When branches are cut back in autumn or winter, they generally produce two or three shoots where there is only room for one to develop properly.

While the tree is growing one cannot remove a single leaf without producing some effect, though that effect may not be visible and may not be sufficient to produce any material harm: but if one removes a large quantity at one time one causes a check throughout the whole system of root and branch. The life blood will cease to flow, and both the tree and its fruit will for a time become hidebound. Those who are practised in budding Roses or fruit trees know what happens if they attempt to operate soon after the top of the stock has been mutilated.

Stopping the growths is a necessary evil, and requires to be done gradually and intelligently. Cutting off armfuls at a time during the growing season is an evil which is unnecessary.

When autumn arrives and the leaves have lost their green colour, pruning should not be delayed. Wounds will heal much more quickly than in the spring. All should be finished by the middle of December. Fruit trees are best when they are allowed to extend somewhat. Even with miniature trees we must leave two or three buds, and a greater number where there is a gap to fill.

It is possible with the treatment recommended to produce early fruiting miniature trees of both Apples and Pears on tree stocks, especially if they are carefully transplanted two or three times while young. There will always be corresponding growths underground with the branches. Unchecked top growths produce strong rambling roots and *vice versa*. Trees on the free stock have their roots deeper in the ground and are, consequently, not so likely to come under the surgical operation of the spade wielded by an unsympathetic hand. Also they are less liable to suffer from drought.

Where bush trees of Apples are so large that light cannot penetrate them it is well to take out the centres 2ft. or 3ft. wide. Incidentally, this makes it easier to gather the fruit.

Though it is too late in the season to practise some of the details mentioned, a beginning can be made by keeping the growths shortened as advised.
WILLIAM TAYLOR.

ON MULCHING

IT is very surprising that mulching has never come into its own as it should have done. Most people still prefer to pour gallons of water and liquid manure on to their plants and allow most of the water to be evaporated by the sun the following morning, instead of making an effort to conserve it for the use of the plants by the systematic application of mulches.

It is no exaggeration to say that mulching reduces the need for watering, at any rate, by 50 per cent. This does not quite mean that one need only apply half as much water at a time, but it means that the water one does apply lasts nearly twice as long. Where very thick mulches have been given, the use of the watering-can may be reduced by two-thirds, and this is of very great importance in districts where water is scarce and difficult to obtain towards the end of summer.

Having made some experiments with mulches, and having used them extensively myself for a number of years, I can confidently recommend the practice. There are various objections, which it is unnecessary to enter into in a short article, but the advantages far outweigh the disadvantages. Mulching has been described as an expensive and uneconomical operation, but if properly carried out it saves its cost many times over, and it certainly renders the cultivation of first-class flowers, vegetables and fruit a much simpler matter on light soils than it could be by any other method.

As I have often pointed out, mulches must vary with the kind of soil and the kind of crop. On very light soils mulches should be of a heavy type, i.e., they should be generous and of a heavy moisture-retaining capacity. On the stronger soils less sticky materials may be used, also the quantity used may be reduced, but in many cases it is an advantage when working on such soils to apply a very heavy mulch in the first instance, as this often will last right until the end of the season.

MATERIALS TO USE.

Viewing the gardening materials which one generally has at command, there are quite a number which are exceedingly suitable for mulching. Obviously such strong-smelling materials as pig manure and sheep manure will be put aside at once, though the first is very suitable for light and the other for heavy soils, did not their strong-smelling character preclude their use. One of the best mulching materials of all for a strong to medium loam is found in old hot-bed manure. This has a very great moisture-retaining capacity of the right character for such soils, but is not sufficiently sticky in character for use on very light land, as it will dwindle away rapidly until very little is left.

Farmyard manure is a very favourite mulch on most soils, but especially on heavy ones. As a matter of fact, I have found it is extravagant, and I do not recommend its use except for gross-feeding crops, such as Onions, where it serves a dual purpose. In some cases it may be used very advantageously on light land certainly, but most of us have not sufficient of it at command to warrant its use extensively as a mulch.

On strong and medium soils half-rotted leaves give very good results, and in some cases it pays to mix in with them before application such materials as dissolved bones or superphosphate of lime. This is specially necessary in cases where

the mulch is to remain for many months and watering is to be done through it, as then a light feed is given at the same time. Half-rotted leaves are probably the most economical mulch of all, as it is merely a matter of collecting a large quantity of leaves for the purpose each autumn and turning them over once or twice during the winter to encourage decomposition to set in. In heat waves, however, they are of very little use, as they dwindle down rapidly and require frequent renewing. Where they are to stand many months a thick mulch is recommended in the first instance, and a dusting of soil should be given over it to prevent the wind from blowing it about and making the rest of the garden untidy.

I am very fond indeed of lawn mowings as temporary mulches on medium loams. They are quite unsuitable for use on light land, as the first hot day will cause them to dwindle down to nothing, but on medium loams they certainly give a good result, and there is no doubt that they have saved many a row of Peas from destruction where watering was impossible. Every effort should be made to apply them as fresh as possible, as if decomposition starts before their use their strong odour generally precludes their application, although, of course, they last considerably longer when so applied.

And now what about very light soils? As already mentioned, these must have a sticky mulch, but the greatest care should be taken not to apply one on the surface of which a hard skin will form. More than once I have stopped gardeners from using pond mud as a mulch, as, although this is a very effective mulch one way, it has a nasty habit of setting hard, and then actually throws off the rain when a welcome shower falls. Cow manure is generally the best material to use on such soils, but as this also forms a skin, or rather, I should say, its outer layer sets hard when applied fresh, care should be taken not to use it until a reasonable time after it has been produced, say, eight or nine days as a minimum. Cow manure can be improved, of course, by the addition of such materials as lawn mowings and fine soil if it is required for urgent application, but I need hardly point out that this adulteration greatly reduces its ultimate capacity for reducing evaporation. On light soils mulches do not stand at all well, and it is, therefore, uneconomical in the long run to do anything which will decrease the cooling power of the mulch.

THE THICKNESS OF MULCHES.

I have made experiments with mulches of very varying thickness, and at the present time am engaged on further work upon them. Up to the present the best thickness on strong and medium soils appears to be 2ins. to 3ins. A temporary mulch on these soils need not be quite rim. in thickness. For light soils the minimum thickness in the first instance should be 4ins., although this may sound very extravagant. Those who have not yet done much in the way of mulching their crops will be surprised how very quickly the thickness of mulches dwindles on light soils, and if bulky materials, such as lawn mowings, have to be used on such, a minimum thickness of 6ins. should be allowed in the first instance, as within a few days this will have been halved by decomposition and consolidation.

I am rather interested in the question of whether it is possible to mix some deliquescent chemical with the materials used for mulching in order to keep it perpetually moist even in very hot weather. Up to the present my researches have not produced any results worth recording, but it is hoped that further light may be thrown on the question, at any rate by the end of the present summer.

In using either cow or horse manure as a mulch the most economical plan is to water through it, and not to remove it each time before watering. Naturally, one gives the plants to be mulched a thorough soaking with water or weak liquid manure immediately before the application of the mulch, as if one mulches a dry soil one keeps the roots of one's plants cool certainly, but one prevents the moisture from reaching them instead of preventing it from leaving them.

I am quite convinced that a great deal of further experimental work might profitably be done on the question of mulching, and those who have time at command will probably like to start on the question immediately. I have had several years of experiment on it myself in a small way,

and have found it one of the most interesting, not to say fascinating, of all the lines of horticultural experiment that I have handled. Flowers, vegetables, fruits and herbs all benefit by the

the survival of the fittest, the fine strain honoured by her *nom de plume*, St. Brigid. That was in an old Kildare garden near the site of St. Brigid's Oratory. The triumph of her labours of love,

A BED OF ANEMONE ST. BRIGID, CROWLEY'S WHITE.

application of suitable mulches, but it is no exaggeration to say that the most suitable mulches for these still remain in many cases to be discovered.

E. T. ELLIS.

CORRESPONDENCE

THE PERENNIAL HONESTY.

THE genus *Lunaria*, known as Satin Flower, or Moonwort, is restricted to about two species, both of which are European, of which *Lunaria annua* (which is correctly a biennial), more commonly known as Honesty, is the better known, both as a flowering plant and (more so) for the decorative value of its dry fruits. *Lunaria rediviva* is a plant very rarely met with, although it was introduced into this country as long ago as 1596, but it is one that deserves to be grown more freely, either as a border plant or for naturalising in the wild garden, as it is equally as good for partial shade as in the open. It differs from *L. annua* in being a perennial, as well as in the shape of its fruits. It is a plant 2ft. to 3ft., or even more, high, with fragrant flowers that are purplish mauve in the bud stage, almost white,

with purplish mauve veins when open, with a purple calyx and borne during May in terminal panicles well up above the handsome bright green, cordate foliage. The elliptical or lance-elliptic pods which taper to each end are perhaps not so decorative as those of the well known Honesty, but will be found very valuable for winter decoration in vases. It is readily raised from seed, or may be increased by division of the roots, while the young shoots 2ins. to 3ins. long will soon root if placed in sandy soil in a cold frame.—F. G. PRESTON, *Botanic Garden, Cambridge*.

ST. BRIGID'S ANEMONES

IT is now fifty years since the late Mrs. Lawrenson, after some years of patient selection and reselection, under annual sowing of the old garden Anemone (*A. coronaria*) achieved, in

apart from promising considerable correspondence, further threatened a penalty of publicity and a notoriety she was anxious to avoid and led to her sheltering herself under the *nom de plume*, "St. Brigid"—hence St. Brigid's Anemones.

It may be that our "soft" Irish climate has been peculiarly well adapted to the old Anemone, known to our gardens for three centuries at least, aided perhaps by St. Brigid's method of treatment. Anyway, that method under the writer's hands, for a dozen years or more, invariably resulted at this season in a gorgeous display which, even at a time when flora is prodigal in colour, was unique. Personal practice, carried out on the lines advocated by St. Brigid, may here be given in her own words: "Having saved seed the preceding May (which would mean June this deferred season) in March or April I select a piece of good ground in a warm situation. I have it well dug and made fine, and then on the surface I have spread a layer of fresh cow droppings collected from the pasture; this is dug 5 ins. or 6 ins. deep, and then some well decayed leaf-mould is mixed with the upper 2 ins. of the bed; it is raked fine, and all is ready for sowing. I then take the seed and mix it with my fingers in some sand that has a little moisture, just enough to make it adhere to the seeds and thus separate them. I next sprinkle the seed thus prepared over the bed, not too thickly, and having ready some fine mould, I, with the hand, shake enough over the bed to cover the seeds, but not to bury them."

The pure white form of St. Brigid's Anemone called Crowley's White—for which Mr. S. Crowley, Parsonsgreen Gardens, Clogheen, Co. Tipperary, received a unanimous award of merit at the spring show of the Royal Horticultural Society of Ireland, April 5, 1923 (a further award of merit being since given to it by the R.H.S. at the Royal Horticultural Hall, Westminster)—is wholly distinct, inasmuch as the anthers as well as the petals are silvery shining white. Mr. Crowley, by the way, is an old pupil of Trinity College Botanic Gardens, Dublin, where he did his "bit" under the regime of the late Mr. F. W. Burbidge, and possibly it was an inspiration derived from that master-hand which led him some few years ago to discern this novelty among a bed of seedlings, and then, by St. Brigid's care, evolve it to the end of its being fixed, a good stock of which he now holds—K., *Dublin*.

TO SUN-LOVERS.

SO many readers of THE GARDEN pass the winter in the South of France that I am sure they will be delighted to learn that the wonderful garden of succulents arranged by the late Prince of Monaco is now open to the public between the hours of eleven in the morning and four in the afternoon. Situated as it is high up on the

THE PERENNIAL HONESTY, LUNARIA REDIVIVA.

rock behind Monaco, the garden entrance is on what is called the "Moyenne Corniche," about half an hour's walk up the hill from the Casino gardens. When I was last there the Prickly Pears, or Opuntias, were in flower—an amazing sight to those who only know the naturalised Opuntia so common on this coast. There are sixty kinds named in the catalogue of the treasures in this garden, and their variety and their beauty in flower must be seen to be believed. The *Cereus* will soon take up the running and remain in flower all through the summer heats, so I would urge all garden-lovers to travel there, where they will see beauties hitherto unknown outside Mexico and Peru. The season of Roses now closing has been extra favourable, so that rose-lovers are keener than ever to add some new beauty to their collections. To such I would say that Gilbert Nabonnand's new climbing Rose Irene Boni appears to me one of the most desirable Roses I have seen for several years. For this coast it is important that it should be a good winter bloomer; secondly, that it should be free in growth with fine, big, full flowers and sweet scented. Irene Boni fulfils all these requirements, and is of the freshest pink in colour. To those who know Lady Waterlow or the fine old Bourbon Duchesse de Nemours I would say it is even better than either of them. Many modern Roses do not succeed on this coast, but I notice that Hadley, a deep red Rose which too often turns purple in northern gardens, is of the most brilliant beauty on this coast. K. of K. also does very well, and Queen Alexandra takes on a new and wonderful scarlet colouring that astomishes the new-comer. These also are particularly good in November and December, when the blooms open slowly and last a very long time.—E. H. WOODALL, Nice.

FRAGRANT FOLIAGE.

I READ the articles under the above title by "Somers" in the recent issues of THE GARDEN with peculiar interest, as I have lately written in another place on the fragrance of plants in relation to insects. "Somers" states that he does not remember ever having seen any explanation of the fact that a very large proportion of plants with fragrant foliage bear labiate blossoms, yet this is exactly what we should expect, as flowers with a lip are specially contrived to attract insects which benefit the plant. The flowers are beautiful but complex machines to secure cross-fertilisation. The flowers of the Orchids are the most complex of all, and it is a noticeable feature of many that the whole plant is fragrant. The Burnese and Indian Orchids, such as *Dendrobium moschatum* and the *Bulbophyllum suavisimum* possess the scent of new-mown hay. *Miltonia Roezlii* is scented like the Rose, *Dendrobium heterocarpon* like the Violet, *Odontoglossum odoratum* and *Maxillaria picta* smell like the Hawthorn. The late Mr. Philip Crowley, who was a relative of mine besides being the treasurer of the R.H.S., possessed one of the finest collections of exotic butterflies ever got together, and in that collection I have seen these insects bearing strange scent glands upon the front borders of their hind wings. Some of them smelled like Sweet Briar leaves, others like the flowers of Honeysuckle and Jasmine, and so attracted their mates. It will be clear that if the scent of a plant, be it in leaf or blossom, is the very one that proves so attractive to the butterflies and moths in their mates, it would draw them in great numbers from long distances to the flower and so procure cross-fertilisation and sustain the vigour of the race. Many butterflies and moths possess a sense of smell far keener than that of any dog or bird. The females of the Empress moth emit

an odour which attracts their mates from no redible distances. One female left in a box covered with gauze-net, in a room with the window open, was, in less than an hour, surrounded by more than one hundred males of her own species. Dr. Kerner in his "Flowers and Their Unbidden Guests" writes that he has seen "the *Convolvulus* hawk moth flying with the swiftness of the arrow to the flowers of the Honeysuckle at a distance from which they could not be seen in broad daylight." Through long geological ages, concurrently with the development of perfumes in flowers and plants, the development of odours in the scales on the wings of moths and butterflies has taken place. Many of these perfumes are perceptible to man, but many which we cannot detect appear to be perceived by the insect. The means by which the butterfly and moth discover the

to Heaven! It is from the earth that the plant, by some marvellous alchemy, draws its fragrance, "therefore nothing is more fit for delight than to know what be the flowers and plants that do best perfume the air." Let us then be thankful for the few we can perceive, of which "Somers" so delightfully reminds us.—H. H. WARNER.

WHITEBEAM (PYRUS ARIA).

A YOUNG tree of this handsome native has appeared at the edge of the copse where it adjoins the lawn. It was strikingly conspicuous in the middle of May, when the greater number of the side branches were tipped with the corymbs of cream-white bloom nearly 6ins. across. It came of its own good will, and is all the more welcome because it is not common on our sandy hills, though abundant on the neighbouring

THE WHITEBEAM, PYRUS ARIA.

particular plants on which to lay their eggs and so provide the proper food for the young caterpillars when they hatch out has been regarded as a mystery, but the key to that mystery is their extraordinary power to distinguish scents often imperceptible to man.

The influence of fragrance has been, and is, a profound one, and it is surprising that this question has not received the same attention as that of colour and form of the flower. The probability is that the leaves of all plants possess their own characteristic and distinctive odours, but our sense of smell is not sufficiently developed to perceive it, just as our ears cannot hear the high notes which are heard by the bat, while the ultra-violet rays perceived by the ant are lost to us. Professor Ray Lankester considers that while man's sense of smell has deteriorated in comparison with what it was in his animal ancestry, yet "he retains a large inherited capacity of unconscious smell-sense, unknown to him and unobserved." Thus it seems probable that we are attracted or repelled by other human individuals by the unconscious operation upon us of attractive or repulsive odours, producing unaccountable likings or dislikings. And what of the delightful fragrance which rises from the parched earth when the rain at length falls on the parched land! That oldest and sweetest incense which ever rose

chalk. Not only are the flowers desirable, but the large leaves have a certain aspect of importance. They are about 6ins. long by 4ins. wide, and the edges are boldly jagged with a double toothing. The upper surface is bright, deep green and lustrous, in strong contrast to the downy whitish back; this white back is specially noticeable on windy days, when the leaves seem to flash as they turn over. A few miles away, among the old Yews bordering the Pilgrim's Way on the chalk downs east of Guildford, a Whitebeam has taken root at the place about 8ft. above the ground where the Yew was originally pollarded and has sent its roots down the hollow trunk. It is now a good-sized tree with its white backed leaves curiously conspicuous above the sombre masses of the dark Yew foliage.—G. J.

TWO FINE COLLECTIONS OF RHODODENDRONS.

MANY thousands of choice varieties are splendidly grown in the charming grounds surrounding Pylewell Park and Exbury House, Hampshire, the country seats of Ingham Whitaker, Esq., and Lionel de Rothschild, Esq., respectively. At Pylewell Park the head-gardener, Mr. Hamilton, is raising hundreds of seedlings. On a gently sloping bank, under stately Oak trees, a very successful attempt is being made to establish a

colony of Rhododendrons. The soil is inclined to be stony, with leaf-mould to a depth of 1ft. or so, then gravel predominates. All the plants are in excellent condition. R. Loder's White was splendid in both form and flower; R. Roylei magnifica was covered with flowers resembling those of *Lapageria roseum*. Rhododendrons *Broughtonii aureum*, *Gauntlettii* and *Gill's Triumph* were others very noteworthy. A speciality is also made of the rarest flowering shrubs and climbers from all parts of the world, too numerous to be referred to in detail in this brief note. At Exbury House Mr. Kneller, the head-gardener,

is busy establishing Rhododendrons, Azaleas, Heaths, rock and water-loving plants over a woodland area covering many acres in extent. The collection is full of gems. R. Loderi and R. Alice were magnificent. Plants of the first named were 12ft. high and nearly as much through. The Heaths and Azaleas are planted in dells and banks, through which winding paths lead the visitor. All the soil is being trenched 2ft. deep. A series of rockeries, waterfalls and ponds extend through one charming wood about half a mile in length. This is only the beginning.—GEORGE GARNER.

GARDENING OF THE WEEK

FOR SOUTHERN GARDENS.

The Kitchen Garden.

Beet.—A further sowing of a turnip-rooted variety may be made to furnish roots during the autumn and it should be borne in mind that this kind need not be thinned too severely.

Mushrooms.—Now is a suitable time to collect the necessary horse droppings for the formation of a mushroom bed. Shake out the litter or straw from the droppings. The latter should be placed in a heap and turned over three or four times to allow the rank heat to escape. An old dark shed will suffice, and when the bed is made up and the temperature falls to about 80°, the spawning should be done.

Peas.—Late Peas are always appreciated and a sowing of a late variety such as Autocrat, Ne Plus Ultra or Late Queen should be made. If the soil is very dry the trenches should be well soaked, also the soil that will cover the seeds. This may be done the night previous to sowing. Continue to stake those sown earlier in the season, and if the weather is dry, Peas are well worth an occasional soaking of water. The ground between the rows should be frequently stirred with the hoe.

Carrots.—We usually make a small sowing of a stump-rooted variety about this date, to furnish roots in the autumn; they are less coarse than some of the long kinds. Sow in lines 9ins. apart and if the seed is sown fairly thinly, no further work will be needed except keeping the patch free from weeds. This crop usually escapes the ravages of the carrot fly.

Coleworts are useful vegetables for the winter and a sowing should be made about this date. When the seedlings are large enough, transplant them 1ft. apart, choosing a fairly rich piece of ground.

The Rock Garden.

General Work.—Weeds should be kept down, and during a spell of dry weather a certain amount of watering is essential. Some will say the rock garden is past its best, but to the plant lover there is always something of interest and at present the Rock Roses, Campanulas, etc., are still giving a good show. Plants that have finished flowering may have their old flower stalks removed, except where a little seed is wanted, and I would advise growers always to save seeds, especially of rare plants, and choice varieties of any favourite flower.

The Flower Garden.

Flowering Shrubs.—When these pass out of flower, all seed vessels should be removed and where necessary any pruning done. Lilacs may have the weak shoots cut out; Deutzias and Philadelphus have most of the old flowering wood reduced to a strong new shoot, but an eye should always be given to a well shaped specimen and the pruning done accordingly. Azaleas often develop quite a lot of seed pods which, if permitted to remain, check the new growth and reduce the number of flower buds for next season.

Bulbs in Grass.—In most instances the foliage has died down, and the grass may be mown at any time. Bulbs that were forced in pots may be planted out whenever an opportunity occurs. Drifts and clumps should be aimed at rather than isolated small patches.

The Hardy Fruit Garden.

Gooseberries.—These are best grown with a short stem, and where such a system is in vogue, all the suckers or growths at the base should be removed at an early stage. This remark also applies to Red and White Currants, but not to

the Black varieties, the best of the basal growths being retained to take the place later on of those that are exhausted. Superfluous suckers must also be cut away from the Raspberry stools and between the rows, while the whole of the fruit quarters ought to be kept free from weeds and insect pests.

The Loganberry.—In addition to the Loganberry, there are various kinds of Brambles grown in some gardens, but all need practically the same treatment. They are now making vigorous growth and as these produce the fruit next season, care must be taken to prevent them being injured. Retain sufficient for next year, cutting away the weakest where reduction in the number is necessary. Tie them to the supports and see that they do not interfere with the growths bearing fruit. These Brambles are profitable plants for training over pergolas, or any fence or wall, and moreover they are not particular as to position or aspect.

Woolly Aphis.—At this period of the year this pest spreads rapidly on Apple trees, and it is often possible to check it before it has attacked the whole of the trees. Methylated spirit applied with a stiff brush similar to that used by painters will reduce this pest considerably.

T. W. BRISCOE.

(Gardener to W. R. Lysaght, Esq.)
Castleford, Chepstow, Gloucestershire.

FOR NORTHERN GARDENS.

The Kitchen Garden.

Celery.—If not already attended to, the planting of this important crop should no longer be delayed. If the trenches were formed and prepared earlier in the season, the number of rows to each trench has no doubt been already decided upon, but where the whole or part of them has yet to be formed, one can recommend a width of 18ins., with 3ft. between the trenches. This arrangement admits of two rows to each trench, with 9ins. between the rows and 15ins. between the plants in each row, the plants to be arranged alternately, not opposite each other. If any trenches have yet to be prepared, it will be advisable to utilise some portion of the quarter from which the Broccoli crop has been cleared, and as the roots of the Celery do not travel beyond the limits of the trench, it will not be necessary to dig the quarter. The trenches should be well supplied with half-decayed farmyard manure prior to being dug and finely broken up. If available it will pay to place a few inches of old potting soil on the surface of the trenches after they have been dug and before commencing to plant. Water the plants to settle the soil about their roots.

Turnips.—Prepare a portion of the quarters occupied by Broccoli and Spring Cabbage for further sowings of Turnips. A sowing of Golden Ball should be made at once, followed by a sowing of Early Milan a fortnight hence; this will supply sweet succulent bulbs right into the winter.

Salading.—If celery trenches have to be prepared now, plant the spaces between the trenches with Lettuces and make another sowing elsewhere. Tie up Cos Lettuces as they develop and make sowings of Radishes every ten days and of Mustard and Cress every week.

Broad Beans.—As soon as the plants of the second sowing have developed sufficiently to bear a reasonable crop, they should be topped as a preventive against attacks by the fly.

Peas.—Stake the later sowings before they incline to bend over. If drought sets in, give the whole crop a copious supply of water or the pods will not fill satisfactorily.

The Flower Garden.

Hollyhocks will now be growing rapidly and attention to tying must be given as they develop; do not tie too tightly. Overhaul and readjust the ligatures from time to time or the plants will get "hanked," when the shoots are apt to snap. An occasional dose of moderately strong liquid manure will materially assist these gross feeders.

Carnations.—If seed was sown in spring and the seedlings were duly pricked out into boxes they will now be ready for planting out into their flowering quarters. The ground for their reception should be deeply dug and well broken up. If the soil is of a heavy nature, horse dung should be applied, with the addition of some road grit or old mortar rubbish. If on the other hand the soil is of a light nature, apply a moderate dressing of mixed farmyard manure and on either class of soil the addition of a little bone meal will be beneficial. Plant firmly at a distance of 14ins. apart, that not being too wide when the plants have fully developed.

Fruits Under Glass.

Vines.—Late Vines will require attention in the way of second thinning of the fruit. First of all remove berries which have in any way been damaged at the first thinning, and in the case of Muscats, remove any seedless berries which have been overlooked. Muscats require closer attention in thinning than do Hamburghs, as owing to their stiff footstalks they cannot yield to each other when left rather thick. The thinning finished, give the border a good watering and unless it is well enriched, finish with some liquid manure to assist in the swelling of the fruit. Promptly remove any sub-laterals which may appear. Increase the ventilation somewhat.

Peaches.—Continue to train succession shoots in such a way that both they and the fruit will receive the greatest possible amount of light. Although it is desirable to maintain a rather drier atmosphere as the fruit shews signs of ripening, yet a vigilant watch must be kept for red spider or thrip and, if they threaten, the garden engine or syringe must be vigorously applied morning and late afternoon, shutting up the house for an hour or so after the afternoon application, then opening the ventilators for the night.

CHAS. COMFORT.

(Formerly Head-Gardener to Mrs. Haig, Broomfield, Davidson's Mains, Midlothian.)

CONSERVATORY AND GREENHOUSE.

Gloxinias if treated as advised last week for Streptocarpuses make excellent plants for the greenhouse, the first batch to flower being grown from tubers raised from seed sown last year and started into growth early in the new year. Plants raised from seed sown early this year should give a good display towards the end of summer. They may be grown quite well in cold frames during the summer months, keeping them fairly close and moist and shutting them up early with plenty of sun-heat and moisture. If a heated frame is available, it is, of course, a great advantage during spells of dull cold weather. Gloxinias enjoy a light rich compost, and when their pots are well filled with roots may be given frequent applications of diluted liquid manure and soot water.

Freesias, Nerines and Lachenalias having finished their growth, water should now be withheld. Stand the plants in cold frames fully exposed to the sun, keeping the frame light on. If preferred, Freesias and Lachenalias may be turned out of their pots and stored in dry sand in a cool place until it is time to repot them during August or September.

Tritonia crocata and its varieties, which have been flowering for some weeks now, should, when their foliage dies down, be treated in the same way as advised for Freesias. It is surprising that this beautiful plant is not more generally grown, as it is excellent for cutting purposes.

Thunbergia alata.—This pretty annual is very useful for furnishing the greenhouse during the summer months. The twining shoots may be trained round neat supports, or to wires or string under the roof. Plants raised from seed sown early in the year are now flowering. If seed is sown at this time, the resultant plants will flower towards the end of summer.

Thunbergia Gibsoni is a perennial species with fine orange-yellow flowers. Plants may be raised either from seeds or cuttings. The slender twining stems should be trained round neat supports. This beautiful plant succeeds under ordinary greenhouse conditions.

Rehmannia angulata, which is so useful for furnishing the conservatory, is best raised from seed, which should be sown at this time. The

young seedlings should be grown on in cold frames, potting them on as they require it. The flowers vary somewhat in colour, thus, when retaining plants for seed, care should be taken to save the best colour forms. There is a fine white variety which makes a good companion plant to the type plant.

Lantana salvifolia is very useful for flowering during late summer and autumn, and good plants for the stages can be grown in six-inch pots. They should be pinched frequently during the summer to keep them dwarf and bushy. This species is very fine for covering pillars in the conservatory, planted out for the purpose in a bed or border. It grows to a height of 10ft. to 12ft., and flowers with wonderful profusion nearly all the year round.

Primulas of the *sinensis* type sown earlier in the year should be pricked off into pans containing light, rich soil. Larger plants may be potted-off singly in thumb pots. Another sowing for succession should be made at this time, giving preference to the stellata type where they are required for purely decorative purposes. *Primula floribunda* and the pale colour form *isabellina* are very useful for the small greenhouse. *P. floribunda* is interesting as being one of the parents of *P. kewensis*. *P. verticillata*, the other parent of *P. kewensis*, should also be sown at this time. Plants of this *Primula* are worth growing on for a second year as they then make fine large specimens. Seed of *Primula kewensis* should also be sown now. The type plant, or original stock of *P. kewensis* does not produce seed, and must be propagated by division. Where stocks of this plant exist, the plants should be divided at this time, keeping them somewhat close and moist for a week or so until they become established.

Royal Botanic Gardens, Kew.

J. COULTS.

A NEW BOOK ON GARDENING

FOR twenty or more years past a great change has been taking place in the kind of plants that appeal to popular taste. Those of us who worked in gardens forty or more years ago recall the important place that stove and greenhouse plants held then in public estimation. We can recall also the names of a good number of nursery firms whose fame and fortunes rested largely on that class of plants. The decline of tender and hot-house plants and the rise in favour of hardy trees and shrubs, alpine and herbaceous plants were immensely accelerated by the war. Pre-war taxation had made its influence felt, but it was as nothing compared with the state of affairs that has arisen in the last seven or eight years—high taxation combined with a greatly increased cost in labour, fuel and other material. Orchids still hold their own, but ordinary greenhouses, and still more "stoves," have either largely disappeared or been put to more utilitarian purposes. The love of gardens and gardening is keener than ever it was, but nowadays it has to be satisfied at a lesser cost than formerly.

It is to meet this new condition of things that Mr. Eley's book* is largely designed, but perhaps still more to lend a helping hand to those who have lately acquired, or are desirous of acquiring, a garden site and want to make the best of it. Mr. Eley says in his introduction, with perhaps too much modesty, that his book may be compared to someone trying to display by the light of a candle a vast collection of pictures. It does something more than that. It gives some leading ideas how the picture gallery itself should be built and where and how the masterpieces should be hung. In other words, he gives very valuable advice in choosing the site of a garden and in the choice of the best trees and shrubs to plant in it; it is these that must always make the base or framework of the garden and provide its really permanent features. The details and the refinements come afterwards, and their elaboration will

provide the garden-lover who is not in a desperate hurry with years and years of rich enjoyment.

The author devotes four chapters to garden-making, and one gathers from them that they are based on that safest of all foundations, the writer's own experience in the task. In his own words, he has been "through the mill." He is not above admitting that he has made mistakes; his desire is rather that others may learn from him how they may avoid them.

Books on gardening may be roughly classified into two groups: those in which the author gives us fine writing and literary charm but which are woefully lacking in genuinely practical guidance; and those full of useful knowledge but very dull to read. Both types have their uses for the lover of gardens. The first gives an uplift to one's thoughts and ideas, the other helps to give them reality. Mr. Eley's book, in a great measure,

ambines the two. Written in an easy manner, with no straining for effect, it affords the pleasantest possible reading, full of shrewd wit and humour, yet at the same time packed with correct information. One might compile a hundred apothegms on gardening from it. A valuable part of the book consists of some 140 pages devoted to the selection, cultivation and brief description of the very cream of hardy trees, shrubs and climbers. Other chapters on hedges, shelter and shade deal with matters in which help is often sought.

The book is admirably printed, light to handle, and is illustrated with twenty-eight full-page plates—reproductions of photographs. It is commendably and unusually free from errors in the spelling of botanical names. We have only noticed one mistake, which is in the spelling of *Trachycarpus*, correct in the text but wrong in the legend to the illustration.

35th SEASON.

MRS. PYM'S FAMOUS PLANTS

Strong transplanted healthy plants, named, and beautifully packed. All orders over 3/- post free; under 3/- please add 4d. extra to help postage. No delay. Satisfaction guaranteed. Any number can be supplied at these prices. CASH WITH ORDER. Catalogue Free.

STRONG TRANSPLANTED STURDY HARDY PERENNIALS FOR BORDERS, ROCKERIES, ETC.: *Achillea*, white or crimson, 4, 1/4. *Agrostemma*, crimson, 4, 1/4. *Alyssum montanum*, rare alpine, golden, summer flowering, 3, 1/6. *Alpine Pinks*, white or coloured, 6, 1/6. *Anchusa*, tall blue, 4, 1/4; dwarf, gentian blue, 3, 1/6. *Alpine Wallflower* (*Cheiranthus*), orange or mauve, 12, 1/4. *Alstroemeria* (*Peruvian Lily*), 3, 1/6. *Antirrhinum*, autumn sown, mixed, 12, 1/9. *Anemone japonica*, pink or white, 3, 1/6. *Anthemis* *Kelwayi*, 6, 1/6. *Aquilegia*, *Kelway's* hybrids, 6, 1/6. *Aubrietia*, purple and new hybrids, 12, 1/9. *Auricula alpinus* and show, 4, 1/4. *Aster alpinus*, 3, 1/6. *Aster* (*Michaelmas Daisy*), best named, all colours, 2, 1/4. *Brompton Stocks*, year old, 12, 1/9. *Campanula*, tall blue, white or mauve, 4, 1/4. *Campanula pyramidalis*, blue or white, two years, 3, 1/6. *Campanula*, blue or white, dwarf rockeries, 3, 1/6. *Canterbury Bells*, double and single hybrids, year old, 12, 1/9. *Candytuft*, perennial, 4, 1/4. *Carnations*, Scarlet or White *Grenadin*, *Crimson Margaret* and good border varieties, 6, 1/6. *Christmas Roses*, large roots, 1, 1/4. *Chinasee*, Indian and Japanese *Pinks*, lovely colours, 12, 1/9. *Chrysanthemums*, strong plants from cuttings, the best named early, mid and late varieties for pots or garden, all colours, 6, 1/9. *Chrysanthemum maximum*, *Giant Orange*, best large named, 6, 1/6. *Commelina*, heavenly blue, 3, 1/6. *Cistus* (*Rock Roses*), 6, 1/6. *Cornflowers*, *Kelway's* blue, 12, 1/6. *Chelone*, coral red, 4, 1/4. *Cerastium* (*Snow in Summer*), 6, 1/6. *Catmint* (*Nepeta*), 4, 1/4. *Daisies*, very large doubles, pink, white or crimson, 12, 1/4; mixed, 20, 1/6. *Dianthus*, grand bedder, all colours, double and single, 12, 1/9. *Dianthus*, rocky varieties, 6, 1/6. *Erigeron stenactis*, mauve *Marguerite*, 4, 1/4. *Quakeress*, 3, 1/6. *Foxglove*, pink, white, spotted yellow, 6, 1/4; mixed, 12, 1/6. *Francoa ramosa*, 4, 1/4. *French Honeysuckle*, red, 6, 1/6. *Fuchsia* *Crimson Bush*, 3, 1/6. *Funkia* (*Cori Lily*), 2, 1/4. *Gaillardia grandiflora*, 6, 1/6. *Galega*, mauve or white, 6, 1/6. *Geum* Mrs. Bradshaw, large two year roots, 1 - each. *Geum* *Glory*, double, scarlet, 3, 1/6. *Geum coccineum*, semi-double scarlet, 4, 1/4. *Gypsophila paniculata*, 4, 1/4. *Helianthemum* (*Sun Roses*), 4, 1/4. *Homocallis*, hardy Lily, new large double orange, 2, 1/4; orange, yellow, tawny large single, 3, 1/6. *Hollyhocks*, *Kelway's* double, 4, 1/6; single, all colours, 6, 1/6. *Hydrangea paniculata*, large plants, 1/4 each. *Hypericum* (*Rose of Sharon*), 4, 1/4. *Iceland Poppies*, 6, 1/6. *Incarvillea Delavayii*, large pink trumpet, 3, 1/6. *Iris*, large flag, mixed colours, 4, 1/6; separate mauve, white, yellow, blue, purple, 3, 1/6. *Iris pumila*, rockeries, pale lemon or Saxe Blue, 3, 1/6. *Lilies*, hardy Tiger, 3, 1/6. *Lithospermum*, rich blue creeping, rockeries, 2, 1/4. *Lobelia cardinalis*, scarlet, 4, 1/4. *Lychnis*, scarlet and salmon, 4, 1/4. *Musk*, large scarlet, 6, 1/6. *Malva*, pink or white, 6, 1/6. *Montbretias*, new hybrids, 12, 1/9. *Oriental Poppies*, salmon, 3, 1/6; scarlet, 6, 1/6. *Pansies*, separate colours, red, golden, blue, white, purple, yellow, mauve, 12, 1/6; large exhibition named sorts, 12, 1/6. *Pentstemon*, best large flowering, 4, 1/4. *Physalis* (*Cape Gooseberry*), 6, 1/6. *Pinks*, coloured, 12, 1/9; whites (*Clove*, cented, 6, 1/6. *Potentilla*, new hybrids, 4, 1/4. *Primulas*, hardy for rockeries, bogs, borders, etc., 4, 1/4. *Polyanthus*, 6, 1/4. *Primroses*, blue and purple, 4, 1/4. *Phlox*, best large flowering, 3, 1/6. *Pyrethrum*, hybrids, 4, 1/4; double white, crimson, pink, 2, 1/4. *James Kelway*, scarlet, 2, 1/4. *Perennial Sunflowers*, 6, 1/6. *Rose Campion*, crimson, 6, 1/6. *Rudbeckia* *Newmanii* and *superba*, 3, 1/6. *Sweet Scabious*, 12, 1/9. *Scabiosa caucasica*, one year, mauve, 3, 1/6. *Silene*, pink, compact 12, 1/4. *Sweet Williams*, pink, scarlet, *Crimson Beauty* and *Double White*, 12, 1/9; best *Auricula*-eyed and hybrids, 12, 1/6. *Thalictrum*, hardy *Maidenhair*, 4, 1/4. *Verbena*, blue, 4, 1/4. *Violas*, Bath's bedding, blue, yellow, purple,

white and mixed, 12, 1/6. *Viola cornuta*, splendid for rockeries, *Mauve* and *Purple Queen*, Blue and *White Perfection*, 12, 1/9. *Viola* *Maggie Mott*, best large mauve, strong plants from cuttings, 6, 1/4; 12, 2/6.

HERBS: Mint, Sage, Thyme, Marjoram, 6, 1/6. Parsley, 20, 1/6.

SPRING SOWN. Best sorts procurable. Early and late Broccoli, Brussels Sprouts, sprouting Broccoli, early and Autumn Giant Cauliflower, Cabbage, sprouting Kale, Onions, Leeks, Savoys, 100, 1/6; 300, 4/-.

Celery, strong transplanted *Giant Solid White* and *Pink*, 100, 2/6.

STRONG TRANSPLANTED GREENHOUSE AND SUMMER BEDDING. *Agapanthus*, blue *African Lily*, two year old, 2, 1/4. *Agatha*, blue *Marguerite*, 6, 1/6. *Aralia* (*Fig Palm*), 3, 1/6. *Arum Lily*, one year, 3, 1/6. *Asparagus Fern*, erect or trailing, 3, 1/6. *Asters*, double or single, 12, 1/-; *Ageratum*, blue, 12, 1/-; *Balsams*, double, 12, 1/4. *Begonias*, evergreen, perpetual flowering, 4, 1/4. *Beauty Stocke*, fragrant, 6, 1/6. *Calceolarias* (*Golden Gem*), 4, 1/4. *Cannas*, *Crozy's* hybrids, strong two year old, 3, 1/6. *Celastris cretica*, spikes yellow and mauve, 4, 1/4. *Clarkia*, 12, 1/-; *Cobaea scandens*, handsome, rapid climber, large purple flowers, 3, 1/6. *Cyclamen*, choice strain, 3, 1/6. *Dahlias*, *Peony-flowered*, *Collarete*, *Colossal*, single, *Cactus*, double, etc., 4, 1/4. *Deutzia gracilis*, 1 for 1/4. *Echeveria*, glaucous rosettes trailing red flowers, 4, 1/4. *Eucalyptus* (*Blue Gum*), 4, 1/4. *Fuchsias*, choice sorts, 4, 1/8. *Francoa* (*Bridal Wreath*), 4, 1/4. *Gloxinias*, large erect blooming, lovely colours, 2, 1/4. *Heliotropa* (*Cherry Pie*), 3, 1/6; bedding, 4, 1/4. *Heliotrope regale*, enormous heads of bloom, 4, 1/4. *Ivy Geraniums*, double pink, 3, 1/6. *Larkspur*, 12, 1/4. *Lobelia cardinalis* *Queen Victoria*, claret foliage, spikes scarlet flowers, 3, 1/6. *Lobelia*, rooted cuttings, best blue, 20, 1/6. *Marguerite* *Covent Garden* White and large yellow and sulphur, 4, 1/4. *Nemesia*, 12, 1/-; *Nicotiana*, white or crimson, fragrant *Tobacco*, 4, 1/4. *Passion Flower*, 2, 1/6. *Pentstemon*, grand bedders, 6, 1/6. *Plumbago*, blue, 1, 1/4. *Primula obconica*, new giant, lovely colour, 3, 1/6; *kewensis*, yellow, 4, 1/4. *Rehmannia*, large pink trumpet flower, greenhouse perennial, 3, 1/6. *Salvia coccinea*, scarlet, 4, 1/4. *Saxifrage* *Mother of Thousands*, 4, 1/4. *Schizanthus*, new hybrids, 12, 1/6; *Pink Pearl*, 6, 1/4. *Smilax*, trailing, 4, 1/4. *Streptocarpus* (*Cape Primrose*), new hybrids, 3, 1/6. *Stocks* (*Ten Week*), 12, 1/4. *Sweet Peas*, 20, 1/6. *Verbenas*, 12, 1/4. *Zinnias*, 12, 1/4.

Tomato, strong transplanted, best varieties, 6, 1/6.

Cucumber, best for house or frame, 3, 1/6. *Cucumber*, best hardy ridge, 4, 1/-; *Vegetable Marrows*, 4, 1/-; *Giant Pumpkins*, 4, 1/4.

STRONG HARDY CLIMBERS. *Ampelopsis* *Veitchii*, self-climbing, small leaf, large roots, several trails, each 2/-; *Clematis* *Flammula*, 2 year roots, 2 - each. *Honeysuckle*, very fine red-flowering Dutch, large plants, 3 - each. *Wistaria sinensis*, large racemes of bluish-lilac flowers, 3/6 each. *Apios*, tuberous rooted *Wistaria* (not *sinensis*), rapid climber, sweetly scented purple flowers, 3, 1/6. *Calystegia*, double pink *Morning Glory*, 3, 1/6. *Passion Flower*, hardy blue and white, 1, 1/4. *Tropaeolum speciosum*, flame flowers, 2, 1/6. *Jasmino*, fragrant white flowering two year rooted cuttings, 1/- each; very rare yellow summer-flowering, 1/4 each; yellow winter-flowering, 2, 1/9. *Ecceemocarpus*, trusses orange-red flowers, 2, 1/4.

* "Gardening for the Twentieth Century," by Charles Eley, M.A., F.L.S. (John Murray, Albemarle Street, W.), price 16s. net.)

Mrs. PYM, F.R.H.S., 10, Vine House, Woodston, Peterborough

Keep your garden produce 'fit' with COOPER'S PREPARATIONS

WEEDKILLERS.

WEEDICIDE

Highly Concentrated Weedkiller. Commended by R.H.S.

1 gal. dilutes to 100 gal. water.
1 pt. tin 2/-, 1 qt. 3/3, ½ gal. 5/6, 1 gal. 9/-

1-50 WEEDKILLER.

Similar to Weedicide, but half the strength. 1 pt. tin 1/8, 1 qt. 2/9, ½ gal. 3/9, 1 gal. 6/6

SPRAY FLUIDS.

NICOTINE (V2) SUMMER FLUID.

For Aphis, Apple Sucker, Capsid Bug, Woolly Aphis, Scale Insects, etc. 1 gal. makes 100 gal. Spray Mixture. ½ pt. 2/-, 1 pt. 3/6, 1 qt. 5/6, ½ gal. 10/-, 1 gal. 15/-

A.S. FLUID.

For Aphis, Apple Sucker, and young scale insects. 1 gal. makes 80 gal. Spray Mixture. 1 gal. 10/6, 5 gal. 42/6

ARSENATE OF LEAD PASTE.

For Leaf-eating Caterpillars, Codling Moth, Caterpillars and other chewing insects.

Kew Guild Dinner.—The annual dinner of the members of the Kew Guild, which was held at the Imperial Hotel, Russell Square, London, on May 30 last, was particularly successful from every point of view. There was a record attendance under the presidency of Mr. J. Masters Hillier; the dinner was good; the various speeches, while being of great interest and even value, were enlivened with real humour; and between-whiles the company was entertained with charming singing by Miss Dorrie Hillier, the eldest daughter of the president; Miss E. M. Harper, a past Kewite; and Mr. H. Maw. Mr. J. Masters Hillier, the president-elect, recounted many interesting memoirs of the forty-three years he had been connected with Kew and also said, that when looking back over that long period, it was very pleasant to remember that there had been exceedingly few failures on the part of the very many men Kew had sent out to all quarters of the globe, and with some of those few failures he knew there had been extenuating circumstances. Mr. J. Burt Davy, who responded to the toast of "The Kew Guild," said that when one looked over the roll of illustrious names which had been, and are, connected with Kew, it would have been excusable if the toast of the evening, instead of being the Kew Guild had been the old one of "Here's to aireselves, there may be ithers but we dinna ken them"—a toast which embodies a spirit which is good to a certain point, while it encourages one to try to do better, but it would be unwise to dwell unduly on it and by not striving strenuously find ourselves left in the lurch. He was at times disappointed that Kew men were not more often in the important positions in the Colonies and elsewhere abroad. This was due to the changing times and the spirit of the Colonies, which demanded Colonials for Colonial posts. Yet, he said, while Government posts were becoming closed to Kew men, there were other openings, particularly municipal and commercial, which the Kew training fitted men to fill, and he thought the younger generation of Kew men would be well advised to hunt up such opportunities. In proposing the health of the president-elect, the Director of Kew first expressed his appreciation of Mr. Davy's suggestions, and then paid a deservedly high tribute to the character and attainments of Mr. Hillier, particularly in his capacity of Keeper of the Museums. No matter what specimen (often very meagre) was brought to Mr. Hillier, he could almost immediately name it and indicate its commercial value. The President, in his reply, referred to the great help he had always received and in most felicitous terms to the high qualities, so well known to the older Kew men, of his predecessor Mr. John Reader Jackson.

Where KIT is indispensable

Benchworkers whether in the factory or in a shanty in the back garden find KIT indispensable. Where oil and dirt are ground into the pores of the skin—there's only one thing then that will clean you—KIT.

Even if your hands were covered with a mixture of grease and soot, KIT could shift it. And the Speed! Tar, grease and paint vanish quickly enough for you to escape the glances that always greet the late comer to a meal.

A CONVINCING TESTIMONIAL.

"I am very pleased with the Greenhouse. I have had great
pleasure in showing friends the new house. No doubt you will
have to supply others before long. I shall always be pleased to
show any enquirers the house, and can, with the greatest con-
fidence, recommend your firm for good-class work and atten-
tion. I may require others later, and will send direct to you."

"I am now awfully disappointed with my other houses I had
a few years ago from various other firms. I cannot now admire
them after seeing yours erected."

Can be erected by a youth in 90 minutes or less.
Can be taken down in same time when required
without removing a single pane of glass.

SUTTON'S SWEET WILLIAMS.

These beautiful flowers are now at their best, and remind us that provision should at once be made for next season's requirements.

We recommend flower lovers to try the following colour scheme:—Centre Giant White, then Pink, and finish off with a band of Scarlet.

The effect will be found most pleasing and quite unlike the old-fashioned Sweet Williams.

SUTTON'S GIANT WHITE - per packet, 1/6.
SUTTON'S SCARLET - " 2/6 & 1/6.
SUTTON'S PINK BEAUTY - " 2/6 & 1/6.

Notes from Maidstone.

MALTHUS IN THE FRUIT GARDEN.

In an age of frankness when youth, unabashed, speaks loudly of matters previously discussed only by the aged in hushed whispers, we need in the no apology for the introduction of restrictive measures in the fruit garden.

The moment is opportune to visit our trees and thin out their fruit to reasonable limits. Injured and diseased fruits should be at once taken away, so that all the maternal nourishment flows to the healthy and well formed individuals. *Toujours de l'audace.*

George Bunyard & Co., Ltd.,
The Royal Nurseries,
Maidstone.

"Thanks to Abol—the plants are clean and making good growth."

This is typical of what users say of Abol Non-Poisonous Insecticide—they find that a regular weekly spraying keeps down the "fly" and invigorates the plant.

Time has proved that there is no better or safer remedy for Green and Black Fly, Woolly Aphis and other pests.

Abol is especially good for Mildew on Roses and other plants, because it also has such a refreshing effect upon the foliage.

Perfectly safe to use on all fruits and vegetables. Clean to handle; no unpleasant smell; non-damaging to paintwork.

Used in the Royal Gardens.

An interesting booklet on Garden Pests, with advice as to treatment, will be sent to anyone, gratis and post free.

In square tins: ½ pint, 1 ¼; pint, 2 2; quart, 3 4; ½ gall., 5 3; gall., 9 6. A measure with each tin.

Abol

Non-poisonous Insecticide

Abol Non-poisonous Insecticide, Patent Syringes and other garden specialities are sold by all Nurserymen, Seedsmen, Ironmongers, etc. Sole proprietors and manufacturers, Abol Limited, 9, Beltring, Paddock Wood, Kent.

No. 2692.—Vol. LXXXVII.]

[JUNE 23, 1923.]

IN A JUNE ROCK GARDEN

EARLY June brings such splendour to the rock garden that one can attempt to do no more justice to the feast of colour which this season yields than to mention individually a few of those plants which, for one reason or another, make the deepest impression upon one at the moment. Though cold, sunless days and colder nights have retarded most things, weeds excepted, the Pinks have been true to their accustomed time and every day now sees a fresh clump opening some cheerful blossoms. The brightest among these is, perhaps, the dauntless little *Dianthus Spencer Bickham*, whose shrill carmine puts most others at a disadvantage, always excepting the numerous little fellows in white, the doubles and singles, the fringed and the plain which are among the most fragrant of their race. One of the prettiest of these is a small-flowered single with long and wiry stems and fine grassy foliage. This is the most highly perfumed of all and is known in old gardens as *Little Dove*, or *Little Dot*, a very dainty little thing whose easy culture is combined with that rare charm which is often indefinable. The Cheddar Pinks (*D. cæsius*) are, of course, among these earlier ones, as is the much more fastidious *D. alpinus* with its glorious big rosy flowers and irresistible attraction for ground pests. A couple of grand old Pinks of the first water, and now seldom seen, which are also in bloom and not to be passed by are *DD. Caesar's Mantle* and *Wolley Dodd*. *Dianthus E. H. Jenkins* is a newer one, after the sumptuous pattern of *Caesar's Mantle*, but it rejoices in a much greater vigour than that of the latter.

Of *Iris tectorum* we had almost despaired. Surface caterpillars and other troubles always so beset our plants that to expect blossom from them began to seem hopeless. Finally, they were put out on the top of a new retaining wall in a free, gritty soil dug from a considerable depth in the building of the said wall. Here they soon shewed their appreciation of the new conditions, and on our return after a fortnight's absence at the

time of the Chelsea Show we were greeted with a number of their exquisite flowers. There is a peculiar, fairy-like beauty about the white form of this lovely *Iris* which beggars description, and the glistening pale blue of the typical form, with its subtle mottling of a darker shade, together with the wavy elegance of falls and standards, gives the flowers of this species an unusual impression of grace and good breeding. Then how can one find words to express one's adoration for the dainty *I. gracilipes*, always so trusty and satisfied jammed in between the rocks that have imprisoned it these last ten years? Or for the wee *I. lacustris* and *cristata*, jewels of the most delicately toned china blue and fine gold?

Androsace foliosa, holding its bunchy heads of large rosy lilac flowers stiffly on 8 in. stems, must

always be given a prominent place among those of its tribe, and it is a good and hardy plant in our shaly soil with an autumnal leaf-colouring of no mean quality. *A. villosa* is another of this genus which, if not quite so reliable with us as the foregoing, is particularly happy this season, and its pale green mat of silky foliage is now being adorned with the pretty, pink-eyed, snow white flowers. *Phloxes*, like *Aubrietias*, seem to have enjoyed the cool conditions under which we have shivered these many weeks, for they have seldom remained so good for such a long period. Their day is coming to an end, however, with some of the choicest of their clan, notably the adorable little *Vivid*, *Fairy* and *aldeboroughensis*—a trio of choice and compact little things of the utmost refinement and charm.

The summer month brings the sweetest of all the *Thymes* into bloom. *T. nitidus*, if that is what we may call that big and bushy early species with its fine rosy lilac heads, now gives place to the *Serpyllum* varieties, to the grass-green white form frosted with its silvery inflorescence, the splendid *coccineum* and a number of intermediate forms. The golden-tinted *T. ericæfolius aurea* is flushed with lilac and, among the many associates of this indispensable family are several forms of *Erinus alpinus*. The white and the carmine varieties of this delightful little coloniser are perhaps the most fascinating, but all are good, and there is a form (*hirsutus*?) with larger flowers of a clearer purple than those of the type which is distinct.

Early June also ushers in the *Cranesbills*, *Geranium sanguineum*, triumphant in the fierce crimson of its gorgeous blooms, and *G. nodosum*, whose more humble aspirations in the realms of colour and form, I strongly suspect, are being "influenced," as others have been, by the fiery splendour of the native. The more æsthetic will doubtless rather abase themselves before the delectable *G. cinereum*, which is earlier here than *argenteum*, or before the still more enchanting purity and grace of *G. c. album*, whose

A CHARMING CRANESBILL, *GERANIUM CINEREUM ALBUM*.

THE BEAUTIFUL SOFT PINK GERANIUM LANCASTRIENSE.

ONE OF THE MOST BRILLIANT ROCK PLANTS, LITHOSPERMUM PROSTRATUM.

THE WHITE HORNED VIOLET, VIOLA CORNUTA ALBA.

drooping, snow white cups are the last word in refinement. The soft pink and prostrate *G. lancastrae* is botanically reckoned a form of *G. sanguineum*, but oh! how different. Nor can one pass unobserved the silvery, fern-like foliage of *Erodium cheilanthoides*, over which the "butterflies" in purple and white are so jauntily poised on their slender stems.

Into the realm of Saxifrage one hardly dares trespass in a general article, but it would seem churlish to omit to mention a few of the later ones of notable merit, if they are not of notable rarity. Among these *S. umbrosa*, Elliott's Variety, so brilliant in the vivid ruby red of stem and blossom and so amenable to all and any conditions, must be accorded a foremost place. The great branching spires of the *Cotyledon*, *lingulata* and *longifolia* sets, the air of distinction and quality which pervades *S. cochlearis minor*, the fine colours and reliability of *S. Aizoon*, in both yellow (*lutea*) and red (*atro-purpurea*), the dense green cushions of one or two of the muscoides section which bear the name of *Stemonth* and enjoy an incredibly long season among other attributes, these, together with the beautiful *S. granulata* (the single-flowered type) and a mossy with white flowers of uncommon substance and purity, *S. Stansfieldii*, both in a cool place, are but a few of the many good things of this genus which bridge the gap 'twixt spring and summer.

The *Armenas* are much in evidence just now, and not a few of these are proving their adaptability for dry wall in no uncertain manner. Bees? Ruby Thrift is still one of the worthiest of these, but of stiffer habit and with quite upright stems of 15 ins. or so is *A. Cephalotes rubra*, a variety of superlative merit. The much shorter, pure white *W. B. Child* makes a pleasing break in the ranks of these often rather shrill-toned pinks, and another plant which has a delightfully moderating effect upon such riotous company is *Veronica gentianoides*.

Vinca herbacea comes on just when its spring-flowering relations are ceasing. A fine and hearty thing this for a spacious slope, which it can cover with its runners and navy blue stars, and another Periwinkle which has been in flower without cessation since early last autumn is *Vinca acutiflora*, with blooms nearly as large as those of *V. major* in a cool glacier white. Though they suffered distressingly during the wet of the early season, the *Onosmas* have made wonderful recovery, and admirable as the old rich yellow *O. tauricum* is, with its more robust constitution, the blue-riband for refinement and unsurpassed loveliness must be awarded to *O. albo-roseum*, which is worth any amount of perseverance, and the best of good places on a level with the eye is not too good for it.

Like the Phloxes, the *Violas* have not resented the absence of heat which cut short their season last May. *Viola gracilis*, with its offshoots, VV. Clarence Elliott's var. in white, Lady Crisp (blue-lavender), Perry's Yellow and Purple Robe are still thronged with blossom, and I am constrained to put in a word of praise for the familiar *V. cornuta*, more especially the old, old blue-purple form, which is very nearly a pure blue in some lights, and the milk white variety of the same thing. These two are such splendid all-season bloomers, they are so easy-tempered anywhere and so elegant withal that even should they be momentarily eclipsed by novelties they can never go wholly disregarded.

That useful wanton, *Corydalis lutea*, is now in the heyday of its ramping abundance, and though most of its kindred grown here are "packing up," *C. squarrosa*, bearing creamy flower-clusters on stout stems, is still carrying on, and the lovely foliage of the much taller *C. ophioarpa*, terminating

in drooping sprays of ivory, grows even more attractive as the spring passes. Two shrubby *Potentillas* claim attention on a sunny slope, one being *P. fruticosa argentea nana* and the other *P. arbuscula*. Both have silver leaves and flowers of an intense yellow, those of the latter being the larger, and both are more or less prostrate and not addicted to long life with us. *Calamintha grandiflora*, on the other hand, which is also in this group, will here live for "donkey's years" and every June begin that long succession of bright rosy mauve blossoms which nestle amid its aromatic foliage. *Veronica Catarractæ* is usually among the first of the shrubby species of its kind to flower, but it is closely followed by the delicately beautiful *V. Bidwillii* and one or two of its varieties. *V. rupestris* once again pleads for the recognition that is its due, it being still one of the finest of its class, all things considered, and then there are its exquisite forms in clear rose pink and pure white, which are still scarce in gardens despite their undeniable merits. No less may be said of the golden-leaved *V. r. var. Treherne*, a plant of the rarest quality and unquestionable vigour which usually shews the first of its blue flowers soon after those of the type have appeared.

The *Lithospermums* are, of course, in great form just now, prostratum and Heavenly Blue being dappled with a galaxy of bloom. Even the somewhat gloomy-spirited *L. rubro-ceruleum* has made worthy efforts and the grassy mounds of *L. graminifolium* are bristling with flower-stems, each bearing their tassels of bugles in the purest

milkwort blue. Both *L. intermedium* and that adorable bushling, *L. petraeum*, are full of promise, the grey green of the latter already shewing the purple which precedes the gentian blue of its dainty blossoms. All of these latter, like so many plants of allied races with drooping flowers, must be placed well up in the line of sight, or one may possess them for years and never fully realise their true worth.

The chinks of the rock garden cliffs and dry walls are as well suited to the Wallflowers as they are to the *Lithospermums*, and the splendour of *Erysimum* (*Cheiranthus*) *Allionii* is never seen in a fiercer light than when against the dull green and keen blue of the above. Such strong contrasts may not always be pleasing. The beautiful *E. Allionii* some would banish altogether from the rock garden, save when it could be associated with kindred tones. In which case with it would have to go the equally gorgeous *C. Pamela Pershouse*, *Geum Borisii*, *G. Heldreichii* and many more. But if these glowing orange shades have a something about which suggests—is it bedding? (perhaps it is in *Allionii*'s case!) a lack of delicacy? or autumn?—we had better not be too fidgety about such matters, remembering that the wild Wallflower of many of our ruins and cliffs is often so full-blooded a yellow that it approaches orange. The fact is it is easy to acquire too exacting a taste in the choice and disposition of our rock garden colours. If each one of us would only be true unto himself the views of the purist would assume the perspective which is their due. A. T. J.

HARDY TERRESTRIAL ORCHIDS

(Continued from page 305)

ON the Continent the culture of hardy terrestrial Orchids is not as popular as it might be. In former times we had here some good growers of them.

We have now at *Floraire* beds of them, and some are grown in pans and in pots which give us great pleasure. We are only really successful, however, with those species which like a dry air: *Ophrys*, some of the *Orchis*, *Serapias*, *Himantoglossum hircinum*, *Anacamptis*, *Aceras*, etc. In the South of France there are some good growers of the *Ophryds* who grow them in pots and keep them at rest from the end of June until October. The pots must be well drained and, if possible, covered with stones in order to keep the roots moist. It is important to bear in mind the fact that those kinds growing in the grass do not resist heat well, as they are accustomed to have their roots—which always grow on the top of the tuber and near to the ground surface—sheltered from the sun's rays by the turf. It is for this reason that we put stones upon the soil.

May I suggest to readers to take advantage of the English atmospheric conditions to grow terrestrial Orchids? Sixty years ago the Comte de Paris at his seat at Twickenham, near Richmond, grew the most complete collection I ever heard of. His nephew once made an inventory of them for me, and I was quite surprised at the richness of the collection growing out of doors there. It is to be hoped that the R.H.S. would help amateurs in organising shows or classes at its exhibitions.

The first thing to consider in growing these plants is that they want a rest time, as do all tuberous or bulbous plants. Even such as *Cypripediums*, *Epipactises*, *Cephalantheras*, *Listeras*, etc., which have permanent roots (always fleshy

and thick) want a time of rest and of sleep. The *Ophryds*, which all possess tuberous roots that store up nourishment in their cells, want it particularly, just as do Tulips or other bulbs. These tubers are, generally speaking, double, one being the old one, the other the young one which maintains life for the coming year, just as a seed does. Some are orbicular, the others palmate, the last being generally found in marshes or wet places. The palmate tubers, then, are for the bog, but some of the entire bulbs, such as *OO. palustris* and *laxiflora*, like similar conditions. The *Ophryses* are all drought and sun-loving kinds. They grow among thin grasses on dry slopes and the "bulbs" are never deep in the soil. The *Ophryses* are always interesting because they have no spurs. Darwin ("La fécondation des Orchidées, traduction française," page 56) thought that they were not visited by insects. But since the interesting observations of Judge Pouyanne of Algier (see "Journal de la Soc. Nat. d'Horticulture de France," February-March, 1916) there is no doubt that this was an erroneous deduction, at least as far as some species are concerned, and that they mimic certain insects in order to attract those particular species. It is well known that there are *OO. apifera* (Bee Orchid), *arachnites* (Spider Orchid), *muscifera* (Fly Orchid), etc., with insect-mimicing flowers. In the South of France the genus *Ophrys* is richly represented by such beauties as *O. Bertolonii*, with a blue spot on the lip; *lutea*, with a golden border to the lip, etc. All *Ophryses* are of easy growth. It is only necessary to remember that they hate damp and want a light soil, a good sunny position and a light grass upon the roots. The grass must never be too thick or it might be dangerous for the bulbs, which only want to be slightly protected

against the heat of the sun. The *Ophryses* are, too, very easy to grow in well drained pots or pans. We have now here a full collection of them grown in that way and have had great success with them.

The remark has been made, and everybody can substantiate it, that the Orchises are denizens of hungry pastures, and that it is in the poor soils that they display their beauty. The hungry field is best for Orchids. I noted that some fields very rich in Orchises lost them as soon as manured. Yet another consideration is that they hate sandy sites. We have lost them planted in sandy ground, even during their resting-time, and kept dry. This is particularly the case with *O. Morio*,

ONE OF THE HANDSOMEST OF HARDY ORCHIDS, *CYPRIPEDIUM MONTANUM*.

which grows in heavy soil, even in clay; *O. ustulata*, *O. Simia*, *O. tridentata*, *O. provincialis* and *Himantoglossum hircinum*. Some like moist ground without being bog plants: *Celoglossum viride* (Frog Orchid), *Gymnadenia conopsea*, *G. odoratissima*, *Listera ovata*, *Orchis coriophora*, *O. militaris*, *O. pallens*, *O. Spitzelii* and all the *Spiranthes*.

For woodland the following kinds are very suitable: *Orchis maculata*, *O. fusca* (of which the "bulb" lies very deep in the soil and which is the biggest of all our Swiss species), *Platanthera* (*Habenaria*) *bifolia* and *P. chlorantha*, and *Listera cordata*.

Floraire, Geneva.

H. CORREVON.

MANY-HUED COLUMBINES

THE Columbine family, which is found scattered over the whole of the North Temperate zone, contains many beautiful and important plants from a garden point of view. There are some sixty or more species contained in the genus, many of which are rare, and have not been introduced into cultivation in this country. Those which have, form one of the most attractive features of the garden during the late spring and summer months, and in addition to the wild species there are numerous long-spurred, lovely hybrids of many shades of colour. They are indispensable for the sheltered flower border in June, and there is no more graceful or easily grown plant for this purpose. They may also be used with equal effect in isolated beds, the various coloured flowers of different shades of deep purples, delicate pinks, bright reds, rich yellows and blues of many tones being all borne on long, graceful stems, arising from tufts of elegant, fern-like foliage.

The culture of the Columbine presents no difficulties. Seeds may be sown in gentle heat in March, or even later, some preferring to sow the seeds in July and August as soon as they are ripe. By the former method stronger and larger plants are obtained which will flower freely next year in May and June. As soon as the seedlings are large enough they should be pricked out in pans or boxes and kept growing on in cold frames till the end of May or June in the case of the earlier-sown ones. By this time they should be large enough for planting out into a shady nursery border, where the only attention they require will be watering and weeding. In September the plants should be transferred to their permanent quarters where they are to flower. In the following spring they may be expected to blossom, but they are generally better the second season. It is not advisable to rely on the old plants for more than two or three years, as newly raised seedlings are more vigorous and satisfactory. Heat is not necessary for raising seedlings, for seed may be sown in a shady border during the spring. The seed, however, of this, like many other members of this family, often take some time to germinate, especially if old, therefore it is not safe to throw away the seed-pots too soon if nothing appears for a time. The following are some of the more important members of the genus *Aquilegia*:

A. ALPINA.—The Alpine Columbine is one of the most beautiful of the whole genus. The true plant is not common in gardens, forms of *A. vulgaris* often doing duty for it. It is a slender-growing perennial, with stems about 1 ft. high, bearing two or three flowers of a bright lilac blue. The sepals are 1½ in. long and more than half as wide, the petals being half as long as the sepals, and often tipped with white. The short, stout spurs are more or less incurved. It is a native of the mountains of Central Europe.

A. BERTOLONI. A slender, elegant plant 1 ft. high, with two or three bright blue flowers on each stem. It is very close to *A. pyrenaica*, but the sepals, which are oblong and 1 in. in length, are less broad and more acute than in the above species. *A. Reuteri* is a still smaller edition of this plant, which is a native of the Alpine regions of Eastern France and Northern Italy.

A. BUTLERIANA. A native of Japan, somewhat of the habit of our native species (*A. vulgaris*). The stems bear two or six flowers of a yellow colour, tinged with claret purple. The spur is slender, erect and nearly straight.

A. GERANIACE. The Rocky Mountain Columbine occupies a leading position among the members of this family. It is a charming plant, growing

about 2 ft. high and bearing several flowers on each stem. Sepals usually whitish, sometimes more or less tinted with blue, 1½ in. long and half as broad, reflexing when the flower is fully expanded; petals half as long as the sepals, with slender and straight spurs 2 in. long. It is a native of the subalpine region of the Rocky Mountains growing by the sides of streamlets. A white-flowered form is found in the Californian Sierra Nevada.

A. CANADENSIS. The Canadian Columbine is of dwarf and spreading habit, with orange-scarlet flowers, tinted with yellow. It enjoys a soil that is distinctly poor, with shelter from wind, thriving in hot, sunny positions. The spur is ½ in. long, nearly straight, thickened towards the tip, with a knob at the end of bright red colouring. Found on rocky ground.

A. CHRYSANTHA.—The Golden Columbine is one of the most showy and useful plants in the whole genus. The stems are tall, many flowered, with the lobes of the leaves much smaller than in *A. vulgaris*. In colour the sepals are primrose yellow, tinted with claret at the tip, while the petals are deeper yellow. The 2 in. spurs are slender and spreading. This species, crossed with others like *corulea* and *Skimmeri*, has produced the many beautiful hybrids which are now so largely grown in gardens. It is a native of Eastern Mexico to Arizona.

A. ECALCARATA.—From South-Western Colorado, this is interesting as having fragrant, white or rose-coloured flowers with little or no spur.

A. EISELLIANA (syn. *A. Bauhinii*).—Of slender habit, 6 in. to 12 in. high, with branching stems and flowers on long peduncles. The sepals are

spur is slender, short and incurved. It comes from Japan and is very early flowering.

A. FLAVESCENS (syn. *A. canadensis* var. *aurea*).—This is somewhat like *A. canadensis*, but taller, with lemon yellow flowers, slightly tinged with red on the back of the sepals. The spur is shorter than in that species, slightly incurved with a knob at the end. Found alongside streams in the sub-alpine zone of the Rocky Mountains, etc.

A. FORTOSA (syn. *A. arctica*).—The habit of this species is more spreading than that of *A. canadensis*, with glabrous stems and glaucous leaves. The sepals are bright red, 1 in. long, with a green tip; petals yellow; spurs ¾ in. long, slender, knobbed at the top. Alaska to California.

A. GLANDULOSA.—The Altaian Columbine is one of the favourites in this family. It grows from 1 ft. to 1½ ft. high with several flowers on its pubescent stems. The sepals are ovate, bright lilac blue, as well as the petals. The spur is short, stout and much incurved. It is found on the Altai Mountains and other districts of Central Siberia. *A. g. var. jucunda* has smaller flowers that are white tipped. *A. Stuartii* is a beautiful hybrid of this species, with large, handsome flowers of violet blue sepals and white tipped petals. Both these grow well in a moist, partly shaded position in strong loamy soil.

A. GLAUCA (Glaucous Columbine).—The flowers of this species are white and fragrant, sometimes tipped with claret, with straight spurs nearly half an inch long. (Temperate region of the Western Himalayas.) *A. nivalis* is a dwarf, one-flowered alpine variety with pale blue sepals and dark blue petals from Kashmir.

A. LACTIFLORA is a rather slender species with thin, glabrous leaves and nearly white flowers from the Altai range of mountains.

PERHAPS MOST BEAUTIFUL OF ALL OLD-WORLD COLUMBINES, *AQUILEGIA GLANDULOSA*.

bright lilac, half an inch long; petals as long as the sepals, pale blue or white; spurs slender, nearly straight. Found on limestone in Central European Alps.

A. FLABELLATA.—A very distinct kind, with glaucous leaves and short stems, bearing bright lilac or sometimes nearly white flowers. The

A. MOORCROFTIANA.—Similar to *A. vulgaris* in habit, with pubescent stems, glaucous leaves and white flowers tinted with lilac. Western Himalaya.

A. OLYMPICA.—Very near *A. vulgaris*, of which it may be called a very fine form. Flowers several on a stem, large, light claret or bright lilac-purple with white petals. Caucasus and Armenia.

A. PYRENAICA (Pyrenean Columbine).—A gem for the rock garden, only a few inches high with slender pubescent stems carrying large flowers in proportion to its size. These have bright blue sepals and petals with a slender straight spur. From the Pyrenees.

A. SIBIRICA (Siberian Columbine).—Close to *A. vulgaris*, differing in the broader, more obtuse sepals, longer and more slender spurs, and glabrous carpels. It is very variable in colour, ranging from different shades of purple to white. Eastern Siberia.

A. SKINNERI (syn. *A. mexicana*).—Skinner's Columbine has the general habit of *A. canadensis*, the lobes of the leaves being broadly rounded and glaucous beneath. It is, however, taller, with flowers having green sepals and petals, and bright red spurs 1½ ins. long. (Mountains of Guatemala.)

A. THALICTRIFOLIA.—Slender species with very distinct foliage like a *Thalictrum*. The sepals and petals are both bright lilac blue in colour. It is a native of the calcareous rock of the Tyrol.

A. TRUNCATA (syn. *A. californica*).—A Californian species of spreading habit and deep red or scarlet flowers. The lamina of the petal is truncate, with a yellow margin.

A. VIRIDIFLORA (Green-flowered Columbine).—A curious plant with slender pubescent stems; sepals and petals green; spur slender, straight, nearly ½ in. long. It comes from Eastern Siberia.

A. VULGARIS.—The Common Columbine varies from 1½ ft. to 2 ft., the many-flowered stems being finely pubescent towards the top. The colour of the flowers is generally bright lilac, or light or dark purple, sometimes white. The spur is stout, short, much incurved, with a knob at the end. Forms of this species occur throughout Europe, also extending into Siberia. Named varieties are numerous, among which is var. *atrata*, with small, dark purple flowers, and var. *nivea*, with pure white ones. The Clematis-flowered Columbines, known as *A. vulgaris* var. *stellata*, are a distinct strain of *A. vulgaris* in which there are no spurs to the flowers. They vary in colour from dark purple to white.

Owing to the freedom with which the different species cross in cultivation, there are many beautiful hybrids and strains, chiefly the result of hybridisation among a few of the better kinds, such as *AA. corulea*, *chrysantha*, *glandulosa*, *vulgaris*, *canadensis* and others. It is a difficult matter to keep the species pure. No species reproduces itself true unless isolated. W. J.

BULB NOTES

IXIOLIRIONS.—Some time back I mentioned Ixiolirions and remarked that I did not see much difference between the two varieties *Ledebouri* and *Pallasii* (or *tataricum*) except that the first named was somewhat the earlier to come into flower. Further experience has confirmed this, and brought out the additional fact that under glass there is no doubt that *Pallasii* is the paler of the two, and I think I may add the more charming. These Ixiolirions belong to the great company of plants which become more pleasing when they are given the protection of a glasshouse. The blue-purple of unprotected nature then takes on a softer and paler look altogether, which I am sure nine out of ten people would call an improvement. Of the grace of either species (?) as cut flowers there can be no question. The lightness of the campanula-like blooms is emphasised by the wantonness of the individual plants about their inflorescences. Old mother Ixiolirion is careful

to bring up her children in the right way. "Now, children, just remember you are not Victorian brothers and sisters whom custom condemned to symmetry and sameness in dress. You belong to the freer twentieth century, so put on your clothes as you like, and the more different from one another you manage to make yourselves the better pleased will I be." All that I have

found the top part of a slender stem from roots, to 15 ins. high. There is a pure white form in addition to the blue, but as I do not as a rule care for white flowers as much as I do coloured, they do not make the same appeal. *H. amethystinus* comes into flower when the Wood Hyacinths are getting over.

HEAVENLY BLUE GRAPE HYACINTH. Although this grand flower is well known, a goodly proportion of those who see it in my garden say, "I never knew it had any scent." It was not over-warm when it was in flower this year, and I did not once get a chance of enjoying that rich spicy aroma which a mass of several thousand plants in full bloom is capable of exuding when they are warmed up by a bright afternoon sun. The best I could do to satisfy my wish for a good sniff was to get a handful or two and keep them in my warm study so that every now and again I might bury my nose in them. The old Grape Hyacinth (*Muscari botryoides*) has practically no scent.

SCILLA ITALICA.—Scent reminds me of *Scilla italica*, which has none, although from the account of it in the *Botanical Magazine* (plate 663) one would suppose it to be sweet, as it is there described as having the scent of lilac. Nicholson leaves out all mention of scent. *S. italica* has not a high garden value. The individual flowers are starry and small, something after the colour of a "blue" *Scilla campanulata*. The

SNAKESHEADS, WHITE AND BROWN.

Fritillaria Meleagris is one of our most charming native plants.

come across carry out this advice "to a T," like dutiful children.

HYACINTHUS AMETHYSTINUS.—One does not very often come across this fascinating flower, so it is not very often that one is called upon to give it an English name. Perhaps one as good as any is Spanish Hyacinth; but then we have to remember that the Spanish Wood Hyacinth (*Scilla campanulata*) is a different plant. In the *Botanical Magazine* it is figured on plate 2425, and is called Amethyst-coloured Hyacinth. This is not very illuminating if anyone wants to be precise as to its colour, for amethysts have as wide a range of colour as "muddling" has of size. A Norfolk magistrate asked a man who was brought up before him what sized stone it was that he saw thrown. "A middling-sized one, sir." Repeated questions got the same answer. At last the magistrate said, "Tell me something of the same size." The yokel thought a bit and scratched his head, "Well, sir," he said, "it was the same size as a middling-sized lump of chalk." I claim but little more preciseness in using the word "blue." There are no end of blues. All I want to convey is that it is a true blue and not a purple that masquerades under this much-abused epithet. It is a pretty, graceful plant with narrow pale blue bells from ½ in. to 1 in. long and from ten to twenty in number loosely arranged

inflorescence is squat cone-shaped when fully developed, which comes rather as a surprise, for the spike in the early days of its existence looks as if the flowers would be like those of a Grape Hyacinth and be almost sessile, but pedicels are developed and the perianth, instead of remaining globular, suddenly expands and forms a little star-like flower, reminding one of *Scilla bitolia*. I would not have called attention to the flower but for its being one of the last of the bulbous plants of springtime to come on to the stage. A clump of a dozen would make a nice addition to the rock garden at the end of May, but it would not be "showy." JOSEPH JACOB.

SNAKESHEADS.—No spring-flowering bulbous plant is more graceful than the Snakeshead, *Fritillaria Meleagris*, of which the white and typical brownish purple forms are illustrated above. This is a plant which seems nowhere out of place. Towards the front of the herbaceous border, in openings in the shrubbery or even in the rock garden it looks equally in place. It has no objection to light shade and seems to do equally well in heavy soils or light, but it does prefer a sweet loam. Probably slight shade is beneficial to this species unless the bulbs are planted in grass, for when found wild it is a native plant—it is always in meadow-land and the grass naturally provides shade to the roots.

SWEET PEAS AND IRISES AT VINCENT SQUARE

THE fortnightly show of the Royal Horticultural Society next after Chelsea is not usually noteworthy for size or great importance, but that held at Vincent Square on June 12 and 13 was a decided exception to the rule. The hall was so filled with exhibits that they overflowed into the Orchid annex, and each exhibit was of a high standard of excellence.

Immediately on entering the hall the visitor could not fail to be impressed by the greater effectiveness of the new style of arrangement. It was quite a charming floral picture. In front and in the very centre of the hall there was a large circular group of Sweet Peas, Antirrhinums, Begonias, Petunias, Gloxinias and other plants delightfully arranged by Messrs. James Carter and Co. On the right front Mr. H. J. Jones had massed a large number of his sturdy, highly decorative pink Hydrangeas. Beyond these Mr. M. Prichard had a pretty floor group of miscellaneous hardy border plants. Still further beyond and rising above Mr. Downer's Lupins were to be seen a brilliant collection of Sweet Peas grown by Messrs. Andrew Ireland and Hitchcock.

On the left front there was a delightful exhibit of cluster Roses. Messrs. William Cutbush and Sons arranged them in the form of a narrow oblong bed with tall weeping standards along the middle rising above massed plants of such dwarf varieties as Mrs. W. H. Cutbush, Jessie, Ellen Poulson and Greta Khis. Beyond these were the feathery cloudly masses of the wonderful *Saxifraga longifolia* and other Rockfoils sent by Sir Everard Hambro. On their right there were numbers of Irises—mostly the tall bearded type—displayed by Messrs. G. Bunyard and Co. and Messrs. Amos Perry, while in the background was a very charming group of Sutton's Sweet Peas rising from magnificent plants of the greenhouse *Clerodendron thalictroides* and flanked by the Irises, Lupins and other border plants which Messrs. Barr and Sons grow so well.

This, in brief, was what the visitor saw almost at a glance on entering the hall, and it was only a tithe of the good things so well displayed in other parts of the hall. The masses of Sweet Peas arranged by Messrs. Alexander Dickson and Sons were very charming, and these included several 1924 varieties. Purple Perfection, Lucifer (deep shades of pink) and the pale primrose Champagne were particularly noteworthy. Mr. H. J. Danerum also had some lovely Sweet Peas. The most attractive of the varieties in commerce were Jean Ireland, Tangerine Improved, Royal Scot, Mascott's Helio, Chelsea, Doris, Frilled Beauty and Hawmark Pink. But there were very many others and of every possible shade of colour.

As we have remarked, the Irises were mostly the tall bearded varieties, and they were well shown by Messrs. Wallace and Co., and splendidly by the Orpington Nurseries. Some of the principal sorts were Alcazar, Eldorado, Ricardi, Golden Glory, Ossian, Princess Victoria Louise, Prosper Langier and Lorely; while the Orpington Nurseries had a fine mass of the splendid Thundercloud, which will be found described under "New and Rare Plants." Messrs. Amos Perry had, besides, stems of the dainty Iris Watson and L. tenax hybrids; while Messrs. Wallace and Co. included such varieties of the tall, graceful Iris *sibirica* as Emperor, alba maxima and Perry's Blue. They also showed Liliu Willmotia, Sparaxis and Ixolirion Palleni; while in the Orpington collection were bowls of Iris Suteishi.

On a floor space Messrs. Waterer, Sons and Crisp most pleasantly associated Irises with

Delphiniums, Verbascones, Oriental Poppies and the yellow Lupin, Sunshine. Messrs. W. H. Rogers and Co. had good clumps of *Meconopsis aurantiaca* plena, with various hardy Primulas and Peonies, and Messrs. Clarence Elliott, Limited, showed their Six Hills strain of scented Lupins. The large masses of *Mimulus luteus* semi duplex and *Lychnis Viscaria* fl. pl. in Mr. B. Ladhams' collection were very effective, and drew attention to his many varieties of garden Pinks, of which Mr. M. Prichard also had a good selection.

A good many hardy Orchids were exhibited by Mr. G. Reuther. These were mostly *Cypripedium* and *Orchises*; but the labels were far too plain, and several visitors passed on sadly and uninformed. *Labertia formosa grandiflora*, *Campanula glomerata*,

Pyrethrum and Day Lilies shown by Mr. W. Wells, jun., were very attractive, as also were Mr. F. Scaplehorn's hardy Primulas, *Celmisia holosericea* and *Saxifraga longifolia*. A very good strain of long-spurred Aquilegias and Marshall's White Foxglove were contributed by Messrs. Dobbie and Co.; and Messrs. J. Cheal and Sons included in their exhibit branches of *Zenobia speciosa*, *Philadelphus* in variety, *Kalmia latifolia* and the half-hardy *Mitraria coccoloba*.

Opposite the splendid large plants of *Saxifraga longifolia* exhibited by Sir Everard Hambro there were the graceful flower sprays of *Saxifraga tumbling waters* springing out from between large boulders. In displaying his plants thus

CAPTAIN SYMONS-JEUNE'S EXHIBIT OF *SAXIFRAGA TUMBLING WATERS*.
This beautiful variety obtained an Award of Merit in 1920

THE EXTRAORDINARY "BRIDAL WREATH"-LIKE *SAXIFRAGA COTYLEDON CATFHAMENSIS*.

Captain B. H. B. Symons-Jeune shewed what a lovely plant it is when growing in a natural manner. He also had a cultural commendation for his plants.

Besides the plants which received awards there was an interesting little collection of rarities sent by Mr. G. W. E. Loder. These included the Western Chinese *Philadelphus Delavayi*, which was introduced in 1887. It is quite distinct in its broader, veined leaves, brownish purple flower-stems and calyx, and in the peculiarly pleasant aromatic perfume. The white flowers have much the appearance of miniature Christmas Roses (*Hellebores*). *Buddleia Colvillei* is the largest flowered of the species that can be grown in the open, and Mr. Loder's dark form was very attractive in its dark blood crimson colouring. Sir J. Hooker considered the species to be the handsomest of all Himalayan shrubs. *Kolkwitzia amabilis* is an elegantly beautiful little shrub from Hupeh, China, and bears flowers much like those of an *Abelia*. It flowered first in this country at the Coombe Wood nurseries in 1901. *Olearia semi-dentata* is a dwarf *Celmisia*-like plant; the large single flowers are really mauve flushed, but, at a little distance, in association with the dark purple disc appear to be very pale blue.

The only exhibit of fruit was an extensive collection of well grown Melons sent by Major Pan, Wormbury Bury, Wroxboro, Herts. These were mostly Hero of Lockinge, King George, Sutton's Superlative, Best of All and Emerald Gem. The fruits were all very shapely and beautifully netted.

NEW AND RARE PLANTS.

Iris Thundercloud.—A handsome and free-flowering Bearded Iris of glorious violet colouring, which would no doubt at sunset give that rich ruby tone we all so much admire. It is a distinct and very desirable variety. Award of merit. Shewn by the Orpington Nurseries Company and raised by Mr. W. R. Dykes.

Lupinus arboreus Light of Loddon.—This very valuable Tree Lupin bears long, well disposed spikes of rich golden yellow flowers. Award of merit. Shewn by Mr. T. Carlile, Loddon Gardens, Twyford.

Pentstemon puniceus.—A quite distinct and uncommon plant. It throws up erect, slender, glaucous stems above 2ft. high, and these are furnished with opposite, stem-clasping, ovate-lanceolate, somewhat fleshy leaves. The flowers, which are borne on short, erect panicles, are of bright deep vermilion colour, and these have glaucous stems and calyces. Award of merit. Shewn by Mr. Charles T. Musgrave, Godalming.

Pyrethrum Harold Robinson.—An effective single-flowered variety of more than average size. The flat ray florets are of rich crimson colour shaded with rose pink. Award of merit. Shewn by Mr. H. Robinson.

Rhododendron diehroanthum.—This is said to be a hardy species from China, and probably it is equal in this respect to *R. Kelseyi* and *R. Roylei*, both of which the flowers somewhat resemble. The orange yellow colour of the tubular

flowers is distinctly deeper in colour where the segments overlap at the margins. Award of merit. Shewn by Lady Aberconway and Hon. H. D. McLaren.

Rhododendron insigne. The specific name is only justified by the rather uncommon colouring

BEARDED IRIS THUNDERCLOUD OF BEAUTIFUL VIOLET COLOURING.

of the smallish flowers, which are lined and flushed with pink and spotted inside. It forms a loose truss of long-stemmed flowers. Award of merit. Also shewn by Lady Aberconway and Hon. H. D. McLaren.

Rose Orange Queen.—A dwarf Polyantha Rose of similar habit and type to Orange King, which received an award of merit at Chelsea and differing only in its paler orange yellow colour. It might almost be described as being an erect, bushy Coral Cluster with rather smaller flowers of a pale orange tone. Award of merit. Shewn by Messrs. Kersbergen Bros., Boskoop.

Saxifraga Cotyledon caterhamensis.—This free-flowering hybrid Saxifrage will probably have as much value in the rock garden as *Francoa appendiculata* has in the flower border. Except that the racemes of the Saxifrage are arched and broader at the base, there is a great similarity in their floral colouring. Award of merit. Shewn by Messrs. Ingwersen and Jones, Bedwell Plash Farm, Stevenage.

Yucca gloriosa argentea. One of the best of the variegated Yuccas. A very good plant was on view; the centres of the leaves were milky white and there was a glaucous hue all over the leaves. Award of merit. Shewn by Messrs. C. Smith and Son, Guernsey.

Miltonia William Pitt.—A handsome stove Orchid. The standards are velvety purple crimson, broadly tipped with white, and half of the large lip is of dull carmine colour, the outer half is white. Award of merit. Shewn by Mr. H. T. Pitt.

Odontoglossum Goldcrest.—A very fine spike of sparkling white flowers freely spotted with pale canary yellow colour and brightened by a gold crest. First-class certificate. Shewn by Messrs. Armstrong and Brown.

Odontonia Corona var. Rajah.—A strikingly handsome spike of chocolate-coloured flowers tipped with greenish yellow. The lower half of the lip is white, the remainder flushed with maroon, and there is a blush-purple crest. Award of merit. Shewn by Messrs. Charlesworth and Co.

CELERY AND LEEKS

ALTHOUGH these vegetables may be grown to a fair size with ordinary treatment and in ordinary garden soil, really fine specimens cannot be grown without special attention. I do not, naturally, mean big coarse plants in the case of the Celery, with hollow, pithy stalks; but large, solid, succulent heads, free from blemish. In the case of the Leeks we all know that big well grown specimens are economical, milder and in every way better than small ones.

The Leek is hardy and withstands severe weather in winter quite well, but the young plants raised under glass are soon checked if they are suddenly exposed to bad weather in spring, and much valuable time is lost while they are recovering strength. The main batches of plants will mostly be planted in the trenches during the month of June. In both instances the trench should be filled to within 6ins. or so of the top, with well rotted manure and soil mixed, and while in a moderately dry condition the soil for the Celery must be trodden down a little. This rich rooting medium should be quite 1ft. deep—18ins. would be better. Having carefully planted the Celery and Leeks, the former with a nice ball of soil adhering to the roots of each plant and the latter in 6in. deep holes in the trenches, there will be nothing to do to them beyond the careful application of water when needed and the dusting of the edges of the trenches with soot.

As the Leek plants grow, the soil will fall in and fill the holes. At the end of July the first bands must be placed round the plants, strong brown paper being suitable; the tops of the plants must be free. As the plants grow the bands may be raised and soil carefully broken in against the lower part of each plant.

In the case of the Celery, especially if it be required for exhibition, earthing up or general blanching must not be done before eight weeks prior to the date of the show. In the meantime begin the work of stimulating the plants by weekly surface dressings of bone-meal mixed with soil and, in addition, a small quantity of sand, forming a circle round the base of each plant and a dusting of the entire surface of the soil with old soot and wood-ashes; not more than sufficient to cover the white roots each time. Then begin to feed with liquid manure in weakly doses every few days, thus maintaining the soil and roots in an even state of moisture. The bone-meal in the soil, supplementing the manure in the trenches, will, with the liquid applications, be sufficient. G. G.

SINGLE ROSES FOR LIGHT SOILS

WHEN the Azaleas have all but ceased to dominate the garden with their blazing colours and all-pervading fragrance it is almost with a sense of relief that one turns to the more gentle charm of the single Roses. It strikes me that a few notes upon those species and varieties of the latter which we have found so amenable to culture in our very light, gritty slopes may encourage others to go in for this delightful class of Rose. I refer especially to those gardeners who, having tried the ordinary hybrid Rose without success, have given up the quest of the Queen of Flowers on the assumption that unless you have a rose soil you cannot grow Roses. There never was a greater error than that. For wheresoever you will find the wild Briars flourishing in hedgerow and brake, on common and hillside, there you will be able to grow to perfection and, with a minimum of trouble, a selection of choice Roses extensive enough to satisfy anyone of moderate ambitions.

Among the earliest of the single Roses to flower (always excepting the May-blooming hybrid Carmine Pillar, still one of the most beautiful of its class) are the Penzance Briars. First favourites among these are, I think, Lord and Lady Penzance. The former has blossoms of a delicate orange fawn tinted with yellow, and the latter tends rather to a coppery hue suffused with clear rose. In both of these Roses, however, one notes something more than a suggestion of that orange-scarlet which they appear to have borrowed from *R. lutea* (Austrian Briar), and yet their fine foliage is not less fragrant, often sweeter, than that of their other parent, our own Sweet Briar. There are, of course, many other admirable varieties in the Penzance section, their colouring varying from the pearly blush of Julia Mannering to the almost blood crimson of Meg Merrihies. Practically the whole of these Briars may be grown as bushes in almost any light soil; they produce handsome fruits, and here, at any rate, they never get any attention beyond an occasional cutting out of dead wood. The deep crimson Anne of Geierstem is probably the tallest of the Penzance class and the most useful for a pillar or rambling over an old tree.

Almost contemporary with the above in order of blossoming is *R. lutea*, and this species might well take precedence over all others in the matter of colour. Of the two best-known forms of this wonderful Rose, that known as Austrian Copper is the more gorgeous, its very large blossoms being a reticent orange-scarlet, shading to a deep yellow centre, the backs of the petals being old gold. Not only the Penzance Briars mentioned but many other double and single Roses owe their wealth of colour to the pollen of *R. lutea*. The other form of this species, the Austrian Yellow, has blossoms of an intense nasturtium

yellow throughout. These superb Roses need rather a warmer soil than most and plenty of sun. They are, however, perfectly hardy, and may be relied upon to bloom profusely during early June in any congenial situation.

R. rubiginosa, our own Sweet Briar, has qualities sufficiently good to merit its inclusion among the best of the wild Roses. There are, however, many forms of this pretty and fragrant wilding, as almost any hedgerow will disclose, some being superior in colour to others. The Sweet Briar will prosper on exceedingly poor, sun-beaten banks and rocky places, its fruits are handsome, and it will often yield a good show of autumn blossoms. Two other natives, in addition to the common pinky white Dog Rose, are the low-growing *R. villosus* of northern England, with an emerald green foliage and rich crimson flowers (the somewhat similar *R. tomentosa* of more southern counties appears to be a form of this) and *R. arvensis*. The latter is the large, creamy white, dark-centred and scentless Rose whose trailing stems are almost thornless and of which there are some good garden forms. The Ayrshire

Another native which is not only good and useful in one or other of its wild forms, but notable as being the origin of so many dwarf Roses, especially the Scotch, is the little Burnet-leaved Rose (*R. spinosissima*) of our seashores, moors and sandy wastes. In its natural habitat this delightful shrublet may attain the height of 4ft. or even more, and you may come across miles of it and not find one of the creamy yellow blossoms more than a few inches above ground. These blooms have a delicious scent; indeed, I know of no more delightful fragrance than that which is a subtle blend of Burnet Rose, Wild Thyme and Lotus drifting on some warm shore-wind of mid-June. Most of the Scotch Roses are, of course, doubles or semi-doubles, but there are some rosy pink single forms of the Burnet, and *R. altaica* (*R. spinosissima maxima*) is a much enlarged and improved variety of the wild species, with long, trailing branches wreathed in big single white blossoms from base to tip, these being followed by round black fruits. *R. spinosissima lutea*, as grown at Kew, is another admirable form. Few places are too dry and sun-beaten for any of these Burnet Roses, and they are first-rate for associating with the Heaths and other dwarf shrubs that will prosper under such conditions.

R. Wichuriana, the Japanese type species, is also a capital plant for draping low walls, slopes of arid soil and waste spots, for this is a true creeping Rose of vigorous habit. Its glossy foliage, moreover, is evergreen and the little white, star-shaped blossoms, which are borne in loose clusters, are produced from July to autumn—much later, it will be observed, than most of the hybrids for which this species is responsible.

The single white type and the blush form of *R. alba*, the old White Rose of cottager's gardens, with its charming foliage and delightful fragrance, are first-rate kinds for use in almost any light, poor soil. Though these old-timers seem to be comparatively common in some districts, they are as rare as rattlesnakes in others. The same may be said of *R. lucida*, there being many localities where this splendid species is scarcely ever seen. The typical *R. lucida* makes a large, spreading, but shapely bush with ruddy stems, broad, glossy leaved and silvery pink flowers which open flat to some 2ins. in width. There is also a white variety. The foliage turns a rich yellow before it falls in autumn, and the orange-scarlet fruits are a conspicuous feature at that season, blending very happily with the glowing tint of the branches.

Another delightful species, much dwarfer than *lucida*, is *R. nitida*, which is also well worth growing for its autumn colouring.

The bristling array of shiny crimson spines which cover its branches are a distinctive feature of this little 18in. bush. Its flowers are single, deep rosy crimson and followed by coral red hips. *R. nitida* will associate well with any of the Burnet class, with the sun-loving *R. berberifolia* Hardii, notable for its curious cistus-like blossoms, or any

THE BEAUTIFUL YELLOW-FLOWERED ROSA HUGONIS.

Roses are supposed to have sprung from this species, and it is one that is by no means averse to lying beneath the shade of trees. *R. arvensis* var. *Miss Jekyll* is said to be distinctly attractive, but as yet it has not got beyond our "wanted" list.

of its forms, and one may add to the same company the rather uncommon *R. alpina pyrenaica*.

R. indica var. *Miss Lowe* is a lovely little single in a clear rosy crimson, but if it is not quite so tree and vigorous here as one would wish it remains faithful to its reputation as an all-season bloomer, a characteristic which it has handed on to the Monthly, Tea and other Roses. Some forms of *R. indica* appear to be much more robust than others, and I am inclined to think that this is a species which should be grown on its own roots like most of the wild Roses. It appears to prefer a warm, free soil with all possible sun.

Always one of the first of the season, the May-flowering *R. sericea* is a welcome object in any shrubbery or woodland garden. The rather small, dark green foliage of this Indian species is distinct, as are the white, four-petalled blossoms, which latter are arranged in the form of a cross. The red spines of *R. sericea* are also a characteristic feature, and one that has been extraordinarily developed in that ferocious-looking form of the same species known as *R. s. pteracantha*. Another early blossomer here is the now well known *R. Hugonis*, whose elegance and charm need no praise from me. This is also a Rose that may be well grown in poor, stony land, but trials with the gorgeous *R. Moyesii* tend to shew that this superb species demands something rather better in the way of a rooting medium—and surely no Rose was ever more worthy of the best one has to offer. Albeit, *R. Moyesii* flowers profusely in our light woodland loam (plus some old cow manure well under it at planting-time) even if it does not make its naturally robust growth.

Western America gives us several wild Roses of quality, one of the most noteworthy being *R. nutkana*, a very free grower with rich crimson blooms and gaily coloured hips which prevail well into winter—a first-rate wild garden plant. Then we have the much dwarfier *R. californica* with a soft, yellowy green foliage and vivid crimson cerise blossoms. Though often a riverside shrub in its own land, this pretty thing does better in a warm, free soil with us. *R. microphylla*, of which there are several good varieties, including a prostrate one, is distinguished by the large size of its fruits and ample, handsome blossoms, both of which remind one of *R. rugosa*, to which it is doubtless allied. The flowers of this Chinaman are deliciously fragrant. Like *rugosa*, it is not fastidious as to soil, and I have seen some admirable specimens thriving on poverty and neglect.

The *rugosas* (Ramanas) are a class to themselves, most of them being true bush Roses and well known for the size and brilliance of their beautiful and highly perfumed flowers, for their splendid foliage and handsome fruits. This is an admirable type of Rose for sandy or other dry soils, and a few specimens will quickly cover a considerable area. Some pretty hybrids have been produced from the *rugosas*—the Sweet Briar, *R. polyantha* and others having been used in the mating.

Where it can be given sufficient space *R. polyantha*, the Garland Rose, may be used with admirable effect as a bush, the long, arching branches rising and sweeping over one another in the form of a huge mound. The flowers of the Garland Rose are white, or nearly so, they are borne in immense trusses, and are among the sweetest of all Roses, their perfume often pervading the air of the whole garden. There are several forms of this fine old Rose, some having much larger flowers than those of the type and all possessing the same vigorous habit and handsome foliage. There are also, of course, those many well known named varieties among the climbers which owe no little of their quality and constitution to *R. polyantha*.

NORTH WALES.

CORRESPONDENCE

ROYAL HORTICULTURAL SOCIETY'S AWARDS.

MESSRS. GEORGE BUNYARD AND CO., LIMITED, of Maidstone have presented medals to the Royal Horticultural Society, which will be offered for award to amateurs for exhibits of Strawberries on June 26, Cherries on July 10, Gooseberries, Peaches and Nectarines on July 24, Plums and Apricots on August 8. On each occasion the medals will be either silver or silver-

have been greatly improved in recent years. One of the chief difficulties in raising it lies with those who have no heated house in which to start it during March. This applies also to Petunias, Zinnias and Helichrysums, which have some difficulty in making headway if sown in cold frames before the weather gets really warm. Salpiglossis and Petunias are covered with glands that are clammy to the touch and give off a characteristic odour that is against them for cut flowers. By reason of the glands they are just the flowers for

dry seasons, dry soils and warm situations, because they can get moisture from the night dews when other flowers are perishing for want of water. I remember one dry season in Mr. Ellam's time at Clevedon, and Petunias and Gailardias were the only thriving beds in the flower garden, when the pond was dried up and no water available.—J. F.

A NICE PLANT OF *FABIANA IMBRICATA* IN THE OPEN BORDER.

gilt. On June 26 the Clay Cup for a scented Rose will also be offered for competition. The Rose must be of good form and colour, not in commerce and possessing the true old rose scent.—W. R. DYKES, *Secretary, R.H.S.*

TULIP KAUFMANNIANA.

THIS Tulip is worthy of more attention than is given by many owners of small gardens and rock gardens. It is most prolific—no Tulip increases so rapidly with me—over a third send down droppers and about half develop side bulbs; and they flower so early—about a month before garden Tulips begin to flower. Although some gardeners may be deterred because they are not as cheap as garden Tulips (Cottage Tulips and other hybrids), they increase so rapidly that very soon a large stock is the result of a small purchase. Can any of your readers account for some increasing by side bulbs, some by droppers, and also give any reason for droppers almost side by side going some in. and some up. down? I have been told that planted too shallow the bulbs send droppers to the proper natural depth; but when, side by side, the droppers go to such different depths, that can hardly be the reason.—V. C.

THE SALPIGLOSSIS.

I AM in full accordance with "Claremont" (page 239) when he says that *Salpiglossis* is not grown to the same extent as it used to be and as it should be. The late Mr. Bain, when at Burford Lodge, used to grow it splendidly in the open air in a fully open and sunny position of the garden. The colours and veinings of the flowers

dry seasons, dry soils and warm situations, because they can get moisture from the night dews when other flowers are perishing for want of water. I remember one dry season in Mr. Ellam's time at Clevedon, and Petunias and Gailardias were the only thriving beds in the flower garden, when the pond was dried up and no water available.—J. F.

A BEAUTIFUL SHRUB.

THAT very beautiful heath-like shrub *Fabiana imbricata*, of which I send you a picture, flowers well in this neighbourhood on borders with either a northerly or a southerly aspect. It stands hard pruning well, which adds to its attractiveness. Cuttings may be taken soon after flowering and root freely.—R. G. N., *Exeter*.

PRIMULA SIBTHORPII.

THE mention of this *Primula* on page 218 recalled memories of the early nineties of last century, when gardeners knew something more of it than they do, owing to the almost unlimited number of recent introductions, at the present day. In those days it was cultivated at Kew, and looked upon as an interesting plant. It was an accepted opinion that it originated the colours now so universal among Primroses and Polyanthuses, and to that source also the colour of hybrid Cowslips may be due. There is just a possibility that a form cultivated under the name of *P. altaica* had something to do with the origin of Polyanthuses, which shew a closer relation to *P. acutis* than either the Cowslip or Oxlip, judging by the size of the flowers, the flat corolla, and the ring round the top of the tube. *P. Sibthorpii* has pale pink flowers, otherwise it closely resembles the wild Primrose. *P. altaica*, as grown in the early 'eighties, had lilac or mauve flowers, some of them borne singly on the stalks, but others in umbels, owing to the elongation of the common stalk which lies hidden among the leaves in the common Primrose. Some modern strains shew this combination of characters, and an attempt was made to distinguish them by calling them Primrose-Polyanthuses.—HORTULANUS.

THE NATIONAL ROSE SOCIETY'S SCHEDULE.

IN the schedule of the National Rose Society's Summer Show are Classes 41 to 48 for "those members who, 'without any assistance whatever,' grow and stage their own Roses." Is not this definition ambiguous and open to misconception? What does "without assistance" mean? It sounds plain enough, and one naturally presumes it means a Rose enthusiast who grows his own Roses, gets his own Briars, plants them, buds them, tends them, plants and prunes his bought plants, does manuring, watering, etc., himself, and does not employ a regular gardener. When, however, among the prizewinners is a man who employs a gardener from year's end to year's end, and the latter has help at times from the chauffeur, surely the very excellent object of these classes—the encouragement of the real amateur—disappears.—THE AGRICULTURAL LABOURER.

THE COLD GREENHOUSE.

IN these days of costly labour and fuel many greenhouses have become white elephants, and that which was formerly a pride and pleasure has declined into that which is very much the reverse. Nothing, indeed, is more depressing to a flower-lover than a derelict conservatory inhabited by shabby-genteel exotics. It is possible, however, to have a greenhouse beautiful and interesting, without such plants, filled from end to end with happy inmates needing no artificial warmth. All those blessed with greenhouses, therefore, who are on the point of scrapping their "glass" because they cannot afford heat should, before doing so, visit an alpine house. In their own homes alpine plants all the winter have blankets of frost-bound snow to protect them until the spring thaw comes. These, in our climate, are generally absent. Hence, as a wet winter may be fatal to them, cold greenhouses laid out as rock gardens have been devised in order to shelter tender specimens. One of these, seen a few days ago at the Royal Botanic Garden, Edinburgh, may be described as a complete success. The floor is paved and the soil banked up and retained in position with red sandstone, which makes an artistic and cosy-coloured setting for alpinists from all parts of the two hemispheres. It is watered by underground perforated pipes with very free drainage under the soil, so that the plants only require occasional watering overhead to clean and refresh their foliage. Here, among a crowd of notabilities is *Fabiana imbricata* from Peru, a member of the Potato family, but like a large Heath both in flower and leaf. Not far from it is a group of Rock Rose bushes from the shores of the Mediterranean—*Cistus Sunrise* with brilliant pink flowers, another with larger blooms of a duller colour, and a neat species, *Cistus rosmarinifolius* with tiny flowers on small bushes. From Australia there is *Hibbertia Readii* with profusion of golden blossom, and from China two species of *Corydalis* are present with large pale yellow blooms. New Zealand is represented by a variety of *Veronicas*, the finest being *Veronica Lavandiana* with large white heads and the hybrid *Veronica Fairfieldii* with pale lavender flowers. Near them is a clump of white, *Celmisia viscosa*, *C. coriacea* and a miniature variety. In this neighbourhood also are several *Olearias*, conspicuous among them *Olearia macrodonata*, and trailing plants like the *Gnaphalium trinerve* with daisy-like blossoms adding grace to the little landscape. A still finer trailing plant *Lotus Bertholetii* from the Canary Islands, with pale grey lace-like foliage, drapes its corner from ceiling to floor, and will be covered shortly with crimson pea flowers. Far be it from anyone to underrate

the balmy delights of heated conservatories. In days of sun failure they have been boons and blessings to which we have been glad to repair when we had the chance. But to many of us, at present, they are of the luxuries which we enjoy most when another is paying for them, and the collection described above has the advantage over a tropical one of requiring little co-operation and no coal for its upkeep. H. W. L.

CLIMBING FRENCH BEANS.

GROWERS of French Beans are apt to confine themselves to dwarf varieties, sowing in succession for a continuous supply, and to leave out of their arrangements the more recently introduced Climbing French Beans, of which from one to two sowings will meet the need of most households and ensure greater crops. For some reason many fight shy of these climbing sorts, but for cropping they are superior to the dwarfs, from the fact that they continue in bearing a much longer time. I have grown Sutton's Tender and True with very satisfactory results and gathered many nice baskets long after the dwarfs had ceased to bear. It is better to use twiggy sticks like Hazel rather than rods, as the slender growths lay hold of them quickly; in fact, any kind of stick which suits Peas will answer for these Beans.—W. LINDERS LEE.

USEFUL FOR UNDERPLANTING.

IT is a little surprising to me that the very dwarf *Bambusa pumila* is not more used as a carpet in shrubbery and semi-wild. Its lively green foliage is peculiarly attractive. The enclosed picture shews it serving as a carpet to *Berberis stenophylla*—seen on the left—and a crimson-leaved Japanese Maple, *Acer palmatum septemlobum sanguineum*—the trunk of which is included

BAMBUSA PUMILA AS UNDERGROWTH.

on the right—and the colour contrast is very pleasing. It is excellent, too, for low game cover—just as useful in its way, in fact, as the rather rampant *Bambusa palmata* is for taller cover. The picture was taken in springtime and the foliage shewn is last year's, but the silvery edges seen in the picture did but accentuate the vivid green of the remainder of the leaves. —N. H. P.

THE GALTONIA.

FEW white-flowering bulbous plants are more effective in a garden in July and August than are the Galtonias—and it may be said that few give rise to more disappointment through misapprehension concerning them. Many people whom I know, planting newly imported bulbs in March, having had their borders adorned with the tall, stiff spikes of ivory white bells, have overlooked an important fact relative to them, viz., that they are Cape bulbs and on that account not over-hardy. In rare instances only have I known these Cape Hyacinths to go through a winter without harm, and that has been when planted in sandy soil, well drained naturally, and in sheltered localities. The safest plan I have found in dealing with them is to lift the bulbs in October when the foliage has died away, to store them in sand in a cool, dry place, and plant again in spring. It is by this method that one may hope to save the stock, and so ensure their beauty the following season. Some who grow Galtonias arrange to plant the bulbs in groups of three or five in conjunction with brightly coloured Gladioli like *Principine* or the old *brechleyensis*, when the effect is certainly noteworthy, but it seems to me that they are equally beautiful when planted among *Delphiniums*. In any circumstances they are a valuable addition to the garden, and warrant the winter care suggested.—CLARE MONT.

FUNKIAS FOR SHADE.

ONE of the most cheertul-looking corners of my garden during an unusually dull, cold May was that where Funkias grow, as represented by such sorts as *F. marginata*, *F. undulata variegata* and *F. lancifolia*. They have been located

there many years, and all the trouble they entail is to take them up occasionally for the purpose of division. I do not know of any hardy plant more useful for decorative purposes in a shady position than Funkias. Complaints are sometimes made in gardens where trees overhang that nothing will grow under them, but an exception must be made in respect of these plants, as they love both

shade and moisture. I prefer the sorts mentioned because the foliage is very pretty, and they do not grow to the abnormal size of the large green-leaved sorts like Sieboldii, which is really better for the margin of a shrubbery or where space is not restricted. Funkias will grow in almost any kind of soil that retains moisture, and are never better served than when planted in the shade.

In the open the sun soon mars the colour of the yellow and whitish leaves, but given a position under trees or the partial light beneath a pergola their beauty will continue much longer. I regard Funkias as an acquisition in a garden near to town, for they thrive where some plants barely exist, and their hardiness in the most trying winters is well known. CLAREMONT.

JACK-IN-THE-GREENS

IT is a great thing for all of us of the blue-aproned fraternity to have the faculty of keeping our eyes open. It must have been very nearly everything in the past when so much of the present A B C of horticultural and botanical knowledge was still under the Gooseberry bush; before the functions of pistils and stamens were fully known; and before the more than golden writing of Mendel was awakened from its thirty-five years sleep. The strange Rose-plantains that grew in John Gerard's garden in Holborn in 1596 must originally have been the find of some sharp eye. The curious wheat-eared Carnation that is figured by Castelli among the rare plants that graced the Hortus Farnesianus at Rome in 1625; the Jackanapes Marigold (was it like a Hen-and-chickens Daisy?) of which William Coles, the famous British exponent of the Doctrine of Signatures writes in his "Adam in Eden"; the Jackanapes-on-Horseback Primrose mentioned by Parkinson in his "Paradisus," as well as the new smooth-edged Carnation, the proud possession, as he tells us, of his friend Master Tuggie; the "green" Strawberry that John Tradescant (c. 1630) found in a woman's garden at Plymouth, whither her daughter had brought it from the woods, all unconscious that it differed in any respect from the ordinary; these, and doubtless many another rarity, must have owed their introduction into garden society as lions to be made much of, because some observant eye singled them out from their ordinary fellows as being out of the common run. Later examples of what an open eye can do may be found in the green Rose James Sprunt, which the Presbyterian clergyman of Kenansville, North Carolina, spotted in 1858; in the unusual colour of a single field Poppy which the late Mr. Wilks found and from which he evolved the well known Shirley strain; and in Kettle's Lloyd George Raspberry and Mrs. Lloyd George Violet, which together have provided him with a house to live in and land to hold his treasures.

Until a mysterious box arrived last March from Guernsey I am very uncertain if I had ever seen a true "leafy Primrose," as the sender called it, certainly never any with such large leafy calyces as those which composed the regular old-fashioned tight nosegay within it were blessed with. To me they had always been Jack-in-the-Greens—a name given them from their fancied resemblance to a well known character of the ancient Morris dancers, or, perhaps, from the small bough-clad chimney sweep who, with his fellows, used to parade country towns and villages on May Day. Was this in turn but a shortened form of Parkinson's full Jackanapes-on-Horseback, taken from something ever so many people would know? But why Jackanapes-on-Horseback?

Be the explanation what it may, Mr. T. C. Corbet, my gardener friend in Guernsey, has produced from very small beginnings a fine strain of them. He has most kindly furnished me with some particulars of his work, and I may say in parenthesis that it was made much easier after

he became conversant with Mendel's Laws. Mr. Corbet happened to sow some Primrose seed in 1905. In 1906 he noticed that one plant "instead of flowering sent up 5 strong leaves on each of two stems; and this is the very start." The plant was marked. In 1907 there were six of these leafy stems, one of which produced a flower of the "ordinary common cream starry type of the wild Primrose." Divisions were made, but most of the divided bits died. Nothing more was done until 1914, when he became acquainted with Mendelism and when he found two tiny seedlings near the spot. These did not flower until 1916. They had the leafy calyces of their parents, but one had primrose-coloured and one washy pink flowers. This was a distinct break. From these two plants by means of crossings with various Primroses and Polyanthus the present wonderful strain has been produced. In the bunch sent me there was a good range of colour, and Mr. Corbet tells me about 75 per cent. come true from seed—that is, come with the leafy calyces. So far the large majority of plants are of the Primrose type, but there is every prospect of his getting a Polyanthus strain as well. He is now busy "fixing," and hopes for still further improvements in 1924, both in the colour of the blooms and in the fixity of the two types. It is of interest to note that the wild Oxlip would not mate with his seedlings. Such, boiled down, is the history of a modern Jack-in-the-Green *redivivus*.

I expect in the good old days these strange-looking uncommon Primroses were invariably increased by vegetative reproduction. They do not breed true. Now, however, Mr. Corbet hopes to be able to fix sufficiently the Primrose section of his leafy-calyxed strain that the increase may take place by the infinitely quicker process of sowing seed.

I had hoped by consulting a couple of back numbers of the *Gardeners' Chronicle* to find out something about Jackanapes-on-Horseback and

Jack-in-the-Green, but they were drawn blank. All I found was a statement that "few plants are more sportive than Primroses, and when out of their normal condition display more novelty and beauty," and a second one, that the hose-in-hose type were called Jacks in Covent Garden in 1868.

Incidentally, in one of the two references, Mr. Nelson of Aldborough Rectory, Norfolk, was referred to as the raiser of new Polyanthuses, and it is said that he produced, somewhere in the 'seventies, a fine variety called Golden Prince. This, of course, is the same man who took Lachenalias under his wing and gave us the well known Lachenalia Nelsoni which up to the present, has been almost "the one and only"

A PROLIFEROUS NARCISSUS, FROM CASTELLI'S "HORTUS FARNESIANUS," 1625.

in ordinary cultivation. Ah! but why should this be so?
JOSEPH JACOB.

FORTHCOMING EVENTS.

June 26.—Royal Horticultural Society's Fortnightly Meeting (two days).—Royal Oxfordshire Horticultural Society's Exhibition.

June 27.—Mitcham, Tooting and District Horticultural Society's Meeting.

June 28.—Royal Botanic Society's Meeting.—National Rose Society's Summer Show, to be held at the Royal Botanic Gardens, Regent's Park, London.

THE SCOURGE OF THE ORCHARDS

The Need for Summer Spraying is Urgent.

RARELY have we experienced a season when fruit trees and bushes of all descriptions have been so badly infested with insect pests as this season, and so far as aphides are concerned the trouble is by no means confined to fruits, for almost everything in the garden seems to be the host of some variety of green, black or red aphid. Sceptics and unbelievers in the value of spraying are taunting those who advocate it with the assertion that the present plague of insect pests explodes all our theories, for they say that if spraying was of any use we ought now to be almost free from garden and orchard pests, whereas we are more troubled than ever.

Such gibes and sneers must not pass without contradiction, for the matter is of too grave importance. The scepticism of the minority is very largely responsible for the slowness of progress in our warfare against garden foes. People who argue that spraying is futile should really confess that they dislike the labour and begrudge the outlay on proper spray fluids and equipment, and we might afford to leave them to their folly if the evil results of their negligence were confined to the plants and trees in their own gardens, but, unfortunately, it is the neglected corners, the odd unsprayed trees, and the few decrepid and foul orchards still to be found scattered about the country that provide fertile breeding grounds for the pests that find their way to those gardens and orchards which, having been cleaned, are healthier and, consequently, offer better fattening grounds for the migrating hosts.

The exceptionally mild winter enabled an unusually large number of pests to come safely through. The prevalence of strong winds has helped to spread the innumerable pests, and the backward growth of all kinds of trees and plants resulting from the continuance of cold nights and lack of sunshine has enabled the pests to nourish themselves upon the tender young growth before it has gained sufficient substance and toughness to ward off the attacks. Furthermore, we have had an unprecedented quantity of foreign surplus nursery stock dumped into our auction marts and market towns, and much of that foreign stock brings with it fresh hordes of pests and plant diseases.

These are the explanations of the present scourge of the orchard and the garden, and far from teaching us that spraying is futile, the facts before us should suffice to spur every garden owner and every fruit grower, large or small, on to more determined efforts than ever to kill as many insect pests as possible.

Had the benefit of spraying an orchard or a garden as frustrated if some neighbouring owner of a small garden simply neglects it and allows pests to breed and flourish without restraint, and it should be looked upon as a bounden duty to spray for the protection of neighbours as well as for personal benefit. We all dislike interference of officialdom, but unless every garden owner and cultivator voluntarily sprays it will surely come to pass before long that compulsion will have to be rigorously adopted by the Ministry of Agriculture.

The aphides can be overpowered by perseverance with simple washes. Many sprays are available, and thus early in the season the use of nicotine washes may be strongly recommended except where Gooseberries, Strawberries and other crops

needing maturity are concerned. Soluble paraffin mixtures are also good and, in fact, there is no need to dwell upon sprays, for these are available in plenty. The more pressing need is for persistence upon careful, thorough and systematic use of the sprayer. The first essential is to dilute the spray to its proper strength. It is useless to seek to increase efficacy by mixing at double strength. The probability is we may only inflict injury upon young growths. A second spraying forty-eight hours after the first is a far wiser and more effective course to adopt. Another point is the trees or plants should be thoroughly washed with clear water the day after spraying with the insecticide. Every side of a tree or plant should be sprayed. The foliage should be thoroughly covered underneath as well as above, otherwise large numbers of the insects will find dry spots and keep out of harm's way.

It is essential that any weeds which are infested with insects should be pulled up and immediately burned. Many a cleaned fruit or Rose tree has been infested by a new batch of aphides that have been hatched out on weeds growing around them. The small caterpillars now so rampant upon fruit trees are the larvae of various kinds of moths. They should be destroyed by such sprays as Katakilla, Killzall and other preparations that kill by contact. To ensure greatest efficiency a well made spraying machine should be used, fitted with a nozzle that will break up the spray

into the finest vapour-like volume, and with a pump powerful enough to drive the spray into every crevice of the bark as well as into the axils of the leaves. The larvae of the social sawfly is a pest that is difficult to deal with. The young larvae are grouped in colonies on the under surface of the leaves, and are protected by a covering web which it is difficult to penetrate. The Hubbard-Riley Kerosene Emulsion is an effective spray to use for this pest, and should be applied through a jet that will drive the fluid with sufficient force to break the web. When once the web is broken it requires but little to kill the insects. To make the Hubbard-Riley Emulsion, first boil ½ lb. of soft soap (8 per cent.) in 1 gallon of water. When dissolved and still boiling, pour the solution into 2 gallons of good quality kerosene oil. Beat the mixture up until it produces a smooth, creamy liquid. Solubility will be improved by next putting the liquid into a spraying machine and forcing it through a fine nozzle into an earthenware or wooden bowl. When cool, bottle the fluid, which may be kept at hand and diluted to one part in fifty of water as required for use. This makes a good wash for Broad Beans, Roses, fruit trees, and anything except very tender-leaved plants, that are infested with aphides or caterpillars. It cannot, of course, be used upon food crops that will be gathered within a period of a fortnight or so.

A. J. MACLELL.

GARDENING OF THE WEEK

FOR SOUTHERN GARDENS.

The Kitchen Garden.

Winter Greens.—As ground becomes vacant it should be filled with winter greens until the requisite number is planted. They embrace Kale, Savoys, Cauliflowers and Broccoli, and although showery weather is preferable for such work, there is no necessity to wait for rain if water can be afforded for a week or so until the roots are established. As a rule the plants should be set in lines 2½ ft. apart and about 2½ ft. allowed between the plants. Where slugs are troublesome dust the soil with lime or soot. In a few weeks the hoe must be used between the plants, and no further attention is needed.

Spinach.—During hot, dry weather it is difficult to keep up a supply of this desirable vegetable, and where this is a necessity cold pits and frames may be utilised for growing a crop during the next two months. Here the seedlings may be kept well supplied with water, and a quick succulent growth will result. Outside, a partially shaded position should be chosen and copious supplies of water afforded at intervals.

General Work.—A pinch of lettuce seed should be sown at frequent intervals to maintain a continual supply, and this remark also applies to Mustard and Cress and Radishes; while Turnips need attention if these are in demand. The thinning of all crops should be done early, before the young plants become unduly crowded. The best results are obtained if two thinnings are made at an interval of a week or so, especially where thick sowing has been practised. The hoe should be kept at work. Peas staked early before the growth falls over, and directly a crop becomes unproductive it should be cleared and the ground got ready for future occupants. Keep the walks free from weeds, and make the garden as clean and tidy as possible.

The Flower Garden.

Roses. The chief work in the rose garden is to keep the trees free from green fly, and directly this pest is seen the sprayer or syringe should be employed. Any reliable insecticide will kill them, but care must be taken not to use the solution too strong. Weeds are held in check by hoeing the beds occasionally, and suckers need to be removed before they make much headway. Specimens growing at the base of walls or the dwelling-house should be frequently examined for insect pests.

Anemone fulgens. This scarlet Wind-flower is one of the most showy plants known, especially

when grown in a mass. It is easily raised from seed, which it sown about this time, I have found to germinate freely. A cold frame is advised, and when the seedlings are large enough they may be pricked out in boxes containing light, peaty soil. If the position is well drained, they may be placed in their flowering quarters in the autumn, otherwise the spring is advised. For this plant a loamy soil is ideal, which is further improved by adding a little lime.

Plants in Vases and Tubs.—Care must be taken to prevent these suffering from drought. As the receptacles become filled with roots a weekly application of liquid manure will be beneficial. Stake any plants that need it, and remove any decayed foliage at once.

Cytisuses.—These shrubs are usually known as Brooms, and to keep them within bounds they require a little pruning immediately after flowering. When cut back to the old hard wood they seldom break into growth, and very often die. Choice specimens should have their seed-pods removed.

The Hardy Fruit Garden.

Strawberries.—Old Strawberry-beds are never profitable, so preparations should be made for securing runners to make fresh plantations later on. The best method is to layer the runners in pots 3 ins. in diameter filled with loamy soil. The young plants must be well supplied with water, and they should be transferred to their permanent quarters before they become starved. In the meantime if the fresh site is available it should be trenched and given a liberal dressing of manure. In any case it should have sufficient time to settle down before any planting is done.

Wall Trees.—About this time Cherries and Plums are often attacked by green and black fly and, unless these pests are destroyed, not only will the young shoots be injured, but the fruit will be disfigured. A non-poisonous insecticide should be employed, and the trees are best treated with a weak solution late in the evening when the sun has lost its power. The following morning the trees should be thoroughly cleansed with clear water.

Fruits Under Glass.

Strawberries.—It will now be necessary to prepare for the plants which will furnish a supply of fruits under glass next year. Young plants are usually set apart for the production of runners, and the first runner should be chosen, for it is believed this gives the best result. Three-inch pots should be filled with a loamy soil and the runner

pegged therein, and it is advisable to plunge the pot to keep the soil moist. When the runner is well established in the pot it may be severed from the parent plant and the pots plunged in ashes until the plants are ready for their fruiting receptacles. The roots in the meantime should be kept well supplied with water and the foliage sprayed over each evening to hold insect pests in check.

Melons.—If Melons are required in the autumn, seeds should now be sown, and at this season they germinate readily in a Melon or Cucumber house. Where fruits are approaching the ripening stage more air than hitherto must be admitted, and fruits that are swelling freely ought to be netted, before they begin to pull down the Vine. Later plants should be pinched at one joint beyond the fruit and, when sufficient female flowers are open to produce a crop they should be fertilised.

T. W. BRISCOE.

(Gardener to W. R. Lysaght, Esq.),
Castleford, Cheltenham, Gloucestershire.

FOR NORTHERN GARDENS.

The Kitchen Garden.

Asparagus.—Cutting of this choice vegetable must now cease for the season. See that the beds are kept free from weeds. Many self-sown seedlings often appear. Any that shew where a blank has occurred should be left, but all others weeded out. Another moderate dressing of agricultural salt—the last for the season—should be applied when rain is likely to occur, but if the weather remains dry the dressing should be applied and watered in with a rosed can.

Seakale Beet.—Although this cannot be termed a first-class vegetable, still it has its value as a stop-gap. It is useful during June because it is then at its best and helps to eke out just before the summer vegetables turn in and there is no great variety available. It should be cleared off, however, at the end of the month, as it then begins to "shoot" and the need for it is past.

Broccoli.—The planting of this crop should be completed by the end of the month and the quarter cleared of the Seakale Beet may, after being liberally manured and dug, be devoted to part of the crop.

Leeks.—The sooner this useful crop is planted out the better will be the results. Ground that has just been cleared of Broccoli comes in handy for Leeks. As Broccoli is an exhausting crop and the Leek is a gross feeder, the ground should be liberally manured and well broken up in the process of digging. To get specimens of exhibition standard, Leeks must be grown in specially prepared trenches and fed regularly by means of drain-pipes inserted in the sides of the trenches as earthing up goes on. Collars should also be used to assist in lengthening the blanch. Quite good Leeks for ordinary use may, however, be obtained by the following method of culture: Form drills with the draw hoe 14 ins. apart and of a depth suitable for Potatoes; then with a bunch of Leeks in one hand and a quite blunt dibber in the other form holes about 4 ins. deep and 6 ins. apart, dropping a plant into each hole as the work proceeds and pushing in just as much soil as will cover the roots. The influence of the weather will generally fill up the rest of the hole and in due course the ridges between the drills are levelled down by means of the Dutch hoe.

The Hardy Fruit Garden.

Strawberries.—Go over the plants again and cut away any further runners that may be shewing and remove any weeds that may have sprung up since the plants were "bedded." As, in dry weather especially, the birds often commence to eat the berries when only half-ripe, the plantation should be netted by the end of the month. The nets may be supported by the following means: Drive stout wooden stakes firmly in at 3 yds. or 4 yds. apart, and standing about 4 ft. high when driven. Connect them both along and across the bed by tightly drawn lacing wire fastened to small staples. By this arrangement the nets are supported and one can pick the fruit in comfort without removing the nets.

Apples.—Notwithstanding the very severe weather of this spring, a certain number of Apple trees, according to situation and variety, will have set more fruits than it is desirable to retain. Some varieties, such as Stirling Castle, set fruit so freely that if young trees had not the fruits severely thinned they would fail to make sufficient wood to form the framework of the future tree. All surplus fruits must, therefore, be thinned out by degrees. Not more than a single fruit should be allowed to develop on any one spur.

Cherries. Dessert Cherries on walls should be protected from birds by suspending a net in front of the trees. Care must be taken, however, that the net is tucked closely in at the edges, as the birds will take advantage of the smallest inlet.

Loganberries will now be making rapid growth, and the supple shoots must be tied up from time to time. If any belated surplus shoots appear, they should be cut out at an early stage.

The Flower Garden.

Carnations. Although Carnations grown for decorative purposes need not be so severely disbudded as those grown for exhibition, still a certain amount of disbudding is essential for the production of well developed blooms. A number of minor flower-buds develop at the base of the main bud, and these should all be removed, so also should the tiny buds which generally shew near the base of the stem, but of those higher up the stem occurring at the axils of the leaves a proportion, say up to half a dozen, may be retained.

Chrysanthemums are now growing freely, and should have the benefit of a little stimulant. If applied in a dry form choose showery weather for its application, failing which apply and then water it in. In any case run the Dutch hoe through the whole after the application.

Sweet Peas should now be shewing their flower-buds and will be greatly benefited by the assistance of occasional doses of rather weak liquid manure. A solution of sheep droppings is hard to beat for this purpose. If this is not obtainable, a little sulphate of ammonia or nitrate of soda will give satisfactory results. Tie in any stems which fail to cling to the stakes or other support.

Herbaceous Plants.—Cut away the flower-stems of early flowering plants. Give additional ties to extra tall plants, such as Delphiniums, Aconites and Helianthus. Keep weeds in check by the careful use of the Dutch hoe and by means of hand weeding when the weeds spring from among the stems of the plants. This is an opportune time for making a general review of the stock and for taking notes of desirable discardings or additions when the time for such operations arrives.

CHARLES COMFORT

(Formerly Head-Gardener to Mrs. Haig, Broomfield, Davidson's Mains, Midlothian).

GREENHOUSE AND CONSERVATORY.

Gilia coronopifolia.—Seed of this beautiful plant is best sown during this month. The young seedlings should be pricked off into pans containing light soil, and when large enough should be potted off singly into thumb pots. They must be well established in 60-sized pots before winter, when they should be kept on the dry side. The best place to winter them successfully is on a shelf, well up to the roof glass, in an airy greenhouse. Damp, stagnant conditions—the ban of so many Californian plants in this country—prove fatal to them. Early in the New Year, when they start growing freely, they should be given more water at the root, and may be placed in their flowering pots, which, for good specimens, should be 6 ins. in size.

Lantana Camara, of which there are many garden varieties, is very useful for greenhouse decoration. Young plants raised from seed or cuttings early in the year, should be potted on as they require it; they should be pinched frequently to keep them bushy. The old plants may be grown on from year to year and in time make large specimens.

Hypocalymma robusta.—This pretty Australian shrub should be more generally grown for greenhouse decoration. It produces its beautiful rose-coloured flowers in great profusion during April and May. It is easily rooted at this time by means of half-ripened twiggy shoots inserted in pots containing sandy peat, standing the pots under a bell glass in a cool house. This plant should be given the same treatment as that given the greenhouse *Ericas*, pinching the young plants frequently to lay a good foundation for the future plants.

Hydrangeas as they pass out of flower should have the old flower-heads trimmed off. At the same time any strong shoots suitable for cuttings should be secured and inserted singly in small pots, plunging them in a close case, in which they should root readily. Any young plants that are to be grown on as large specimens may be potted on at this time. Stand them out in an open, sunny position and, if the pots are partly plunged it will save the soil from drying up so much.

Hydrangea in the rooting plants and when well established, may copious supplies of water at the roots. When the cuttings are well rooted they should have a shift into 48-sized pots, growing them on in a cold house or frames until the autumn, when they should be freely exposed to the weather on every suitable occasion, taking care to protect them during frosty weather, otherwise the flower-buds may get damaged. There are now many fine new varieties, some of the rose-coloured forms being very beautiful, and I find they are much more dependable in flowering than some of the older varieties. Large specimen plants that were started late are now growing freely, and require ample supplies of water at the root and liberal feeding with liquid manure or diluted soot water.

Arctotis aureola. This brilliant orange-coloured Composite is now passing out of flower. It is by no means common in cultivation; this is no doubt due to the fact that its successful propagation is not generally understood. It is a difficult plant to increase by means of cuttings, but can be increased readily by layering at this time. For this purpose the plants should be turned out of their pots and planted outdoors or in cold frames, the operation of layering being rendered easier if the plants are heeled over on their side. *Arctotis asper* and *A. revoluta* are both desirable species for greenhouse decoration, and these are readily increased by means of cuttings.

Calceolarias.—Where good specimens of the herbaceous type are desired, the seed should either be sown now or early in July. The seed-pots should be watered some hours previous to sowing, the fine seeds being sprinkled on the surface of the soil. If covered at all, it should be with a light dusting of fine sandy soil. The pots should be covered with a sheet of glass and be kept shaded until germination takes place. If it is necessary to supply water, the pots should be stood in a vessel of water and not watered overhead; this is a safe rule to observe when dealing with hue seeds of any sort. Calceolarias enjoy cool, moist conditions at all times, close and warm conditions soon proving fatal to them. They are very subject to attacks by green fly, which may be prevented by frequent light fumigations. Seed of the quaint and beautiful *C. cana* hybrids is now on the market, and these plants are well worth the attention of lovers of choice plants. They are all beautifully marked, some with the violet colouring of *C. cana*, while in some of the hybrids the delicate violet scent of the parent *C. cana* is retained. As regards cultivation, they require the same treatment as the herbaceous varieties, but as many of them have the woolly leaf character of *C. cana*, care must be taken during winter not to get the foliage wet, as the plants are very apt to damp off.

Pelargoniums of the Zonal type required for flowering in winter should be in their flowering pots, which, according to the size of the plants, may be 6 ins. or 7 ins. in size. Firm potting is essential, as hard, firm growth is very important for successful flowering. For this reason the plants should now be stood out in an open, sunny position. It is an advantage if they can be given plenty of room in cold frames; they may then receive the protection of the frame lights during spells of wet weather.

Lapagerias are now growing freely, and the tramping and regulating of the shoots requires daily attention. Any young growth from the base of the plants should be protected from attacks by slugs by placing ashes round the growths. A good wad of cotton-wool wrapped round the young growth at the ground line will generally prevent attacks.

Royal Botanic Gardens, Kew.

J. CUTTS.

A Showy Olearia.—Although numbering more than a hundred species, all natives of Australasia, only one has, up to the present, proved sufficiently hardy in the open to warrant wide cultivation in the British Isles. This is *Olearia Haastii*, a native of Canterbury, New Zealand, where it grows at 4,000 ft. to 5,000 ft. elevation. *O. albidula*, is also a New Zealand species, a native of the North Island from North Cape to Taranaki, generally found growing near the sea. It is described as a large evergreen bush or small tree 10 ft. to 20 ft. high. The leaves are oblong, 2 ins. to 4 ins. long, coriaceous in texture, with a soft white tomentum on the underside. The white flowers are freely borne in large flat

panicles during late summer. Plants have grown freely for several years past in the London district, but as the winters have been comparatively mild we must wait for a hard winter to test its hardiness. In any case, for the milder parts of these islands and against warm and sheltered walls it is a very interesting and showy species.

The Nankeen Lily.—This is such a very beautiful and distinctive Lily and one so easy of culture that one wonders why it is still so seldom seen in gardens. It will prosper in almost any well drained loam or sandy peat with full exposure, and there send up its oft. stems which terminate in the later spring in generous whorls of large, recurved blossoms of remarkable loveliness. These flowers are fragrant and of a unique and very charming colour, which may be described as creamy ivory, or nankeen, the anthers being crimson. In some forms the colour may tend more towards a yellow buff, suffused with just a hint of delicate rose. In leaf and flower there is a suggestion of *L. candidum* in *L. testaceum*, as this Lily is called, and the strongly recurved flowers and other features betray the influence of its other reputed parent, *L. chalcidicum*. Anyone who has any success with the Madonna Lily will find *L. testaceum* even easier and more permanent. Syns. *isabellinum* and *excelsum*.

A Pretty Carpet.—For the margin of the bog or, indeed, any cool soil that does not get too dry there are few more fascinating little plants than *Mimulus* (*Mazus*) *radicans*. The foliage of this pretty New Zealander spreads over the soil in a perfectly prostrate manner, the dull green, purple-tinted leaves overlapping and hugging the ground like the scales of a Liverwort. Towards the end of May this sullen and apparently lifeless mat breaks into flower, and the blooms, as if to make amends for the humble obscurity of the rest of the plant, are not only large—about 1 in. across—but most striking in their milky whiteness set off with a conspicuous eye of gold and daub of violet. In bleak localities this charming thing is not to be trusted to stand the winter, but a stock may be secured by giving frame protection, and one is well repaid for such trouble.

A Stately Toadflax.—If *Linaria purpurea* (*repens*) is a plant discreetly to be omitted from the sanctuary of the rock garden, since it is a somewhat robust coloniser in some soils, it is one well worthy of a place in open woodland, among Heaths or other lowly shrubs, or the mixed border. Though not always long lived, *L. purpurea* is a perennial with the characteristic emerald foliage of the Toadflax family and branching spires which rise stiffly, yet elegantly to some 4 ft. or more, the ends of the stems and laterals terminating in spikes of little blossoms in various shades of purple. Some of these latter may be rather crude, but others—to be selected—are a delicate soft lavender, which in the mass gives a most delightful smoke-blue effect. This particular form is first-rate for associating with many of the *Ericas* when colour harmony is desired, and the white variety is a very lovely thing and not nearly so redundant as the purples. Almost any soil seems to suit *L. purpurea*, and it is excellent as a drought-resister for poor, stony, sun-beaten banks.

Trials at Wisley. The Royal Horticultural Society will carry out a trial of *Schizanthuses* and annual Larkspurs for flowering under glass during the coming winter and spring. A packet of seed of each variety for trial should be sent to the Director, R.H.S. Gardens, Wisley, Ripley, Surrey (from whom the necessary entry forms may be obtained) so as to reach him on or before June 30, 1923.

Trial of Winter-Flowering Carnations at Wisley. The following awards were recommended by a Judging Committee representing the R.H.S. Floral Committee and the Carnation Society after examination of the growing plants on four occasions, spread over two winter seasons, 1921-22, 1922-23. The awards are recommended solely on the value of the plants for flowering between October and March, and take into consideration form and colour of the flowers, habit, vigour, constitution and floriferousness of the plants. They are not intended to mark value as exhibition flowers nor as summer-flowering plants.

Awards of merit to Wivelsheld White, White Wonder, Mrs. Walter Hemus, Enchantress Supreme and Triumph, all sent by Messrs. Allwood Brothers and Mr. C. Engelmann; Bona, The Herald, General Joffre, Aviator and Jazz, all sent by Mr. Engelmann; Iceberg, sent by Mr. Jones; and Atlantic and Oceanic (Perpetual Malmaison), sent by Messrs. Allwood.

Highly Commended. White Enchantress, Jessie Allwood, Delice, Bishton Wonder, Mikado, Wivelsheld Claret, Wivelsheld Wonder, Benora and Wivelsheld Beauty, all sent both by Messrs. Allwood and Mr. Engelmann; Sunstar, May Day, Lady Northcliffe, Nora West, Elsenham Beauty, Harlequin, Fanny, Fancy Carola and Iona, all sent by Mr. Engelmann; White Pearl, sent by Messrs. Stuart Low and Co.; Countess of Wilton, sent by Messrs. Stuart Low and Mr. Engelmann; El-peth, sent by Mr. W. F. Hamilton; West Hall Scarlet, sent by Mr. G. Carpenter; Claremont, sent by Mr. F. A. Jones; and Gigantic (Perpetual Malmaison), sent by Messrs. Allwood. Some thirty other varieties were "commended."

ANSWERS TO CORRESPONDENTS

FLOWER GARDEN.

TULIPS DISEASED (C. A. Ware).—No doubt a fungus, *Botrytis parasitica*, has caused the main damage to the Tulips, and either the bulbs were diseased when planted or the soil has become infected with the resting bodies of the fungus, which will, if Tulips are again planted, cause further spread of the disease. No soil treatment is likely to avail, and it would be well to abstain from planting Tulips here for a few years.

FRITILLARIAS UNSATISFACTORY (W. F. M. C.).—The Fritillarias are not diseased, but evidently fail through lack of water. They prefer damp quarters, and would be the better for replanting in a damp (not to say wet) spot in the sun.

MADONNA LILIES ATTACKED (Mrs. C. Hants).—The Lilies are attacked by the common lily disease. This disease may be avoided by planting in a soil rich in lime, and in a place not subject to cold draughts or to late frosts.

THE GREENHOUSE.

CHRYSANTHEMUMS AND THE LEAF MINER (H. D. N.).—Spray affected plants with a good nicotine wash. Take care that old potting soil is not used, and that all frames and other places where the plants have been grown are thoroughly cleansed before using again.

KITCHEN GARDEN.

TOMATOES UNSATISFACTORY (D. M. G., North Devon). No parasites were to be found on the Tomato plant. Something has probably been amiss with the cultivation.

TOMATOES ATTACKED (T. A., Sutton-on-Trent).—The Tomatoes are attacked by the fungus *Phytophthora cryptogea*, which attacks the plant from the soil. Probably the soil used was infected. The tops of the plants may be rooted and new plants grown on, this saving time.

FRUIT GARDEN.

APPLE TREES ATTACKED (C. E. D., Dorset).—The Apple trees are badly attacked by apple mildew. Cut out the diseased shoots behind the point at which the mildew is apparent and burn them. Spray the rest of the tree with potassium sulphide (1 oz. to 4 gallons of water).

STRAWBERRY PLANTS DISEASED (B. E. S.).—The Strawberry is affected with "cauliflower disease" due to the attack of the stem eelworm, *Tylenchus devastatrix*. The plants should be destroyed and none should be planted in the affected ground for some years to come, nor should the runners from these plants be used for propagation.

CHERRY AND APPLE TREES ATTACKED (M. E. B.).—The Cherry tree is attacked by the cherry black fly and aphids, which is very abundant this year. The tree should be sprayed once, or twice if necessary, with *Katakilla* or with a nicotine wash, and so should the Apple tree. The latter is attacked by a different aphid, and from what our correspondent states, by American blight in addition. Wherever the latter occurs the place should be painted with methylated spirit.

MISCELLANEOUS.

A PROLIFEROUS DAISY (A. H. C., Newick).—The specimen sent for examination is the well known Hen and Chickens Daisy, grown and figured by many old herbalists and gardeners. It is produced by the continued growth and branching of the flower-stalks.

PLANTS FOR IDENTIFICATION (A. R., Lanark).—The plants sent for identification are: 1, *Diaplas glutinosus*; 2, *Fabiana imbricata*; 3, *Berberis stenophylla*. The best way to propagate *Fabiana imbricata* is to make cuttings of firm young shoots in spring, insert them in sandy soil, and place the pots in a cold close frame. Keep them shaded from direct sun till they are rooted and then gradually allow more air. Seeds provide the best means of increasing *Diaplas glutinosus*, and they are produced freely. Sow as soon as they are ripe, or they may be kept till the following spring. Cuttings also will root readily if inserted in sandy soil and placed in a little heat.

PRESERVING TOADSTOOLS FOR INSTRUCTIONAL PURPOSES (C. B., Essex).—Toadstools are very difficult to preserve. Perhaps the best method is to remove the top and place it on a piece of paper covered with a glass until the spores fall and make a pattern of the gills, which may be preserved. The top may be skinned and the skin dried by placing in warm sand, and the general form may be recorded by cutting the toadstool through the middle so as to obtain a slice showing all parts. This may also be dried, either in the same way or between pieces of paper as ordinary plants are dried.

THE DESTRUCTION OF WOODLICE (G. H. P., Malvern).—On a rock garden the best method of dealing with woodlice is to trap them. This may be done by placing here and there halved Potatoes, in which a hollow has been scooped, with the hollowed side down. If these be examined daily, and the woodlice caught by killing by dropping into boiling water or water with a covering film of paraffin, the pest may be reduced to small numbers.

NAMES OF PLANTS.—F. M.—*Mimulus luteus maculatus*.—H. J. Whyteleaf.—*Claytonia perfoliata*. (This is a North American plant now naturalised in many places in this country).—E. T., Prenton.—*Muscari comosum*, "Tassel Hyacinth."—Mrs. H., Saltwood.—1, *Esecalonia macrantha*; 2, *Tricuspidaria lanceolata* (red flowers); 3, *Olearia macrodonta* (white flowers); 4, *Picea pungens*.—C. B., Limerick.—*Billbergia nutans*.—Mrs. J., Sussex.—*Olearia stellulata* also known as *O. Gunniana*. (A native of Australia, this plant is only hardy in the warmer parts of this country).—R. M., Essex.—*Lathyrus Aphaca*.—S. R.—1, *Crassula coccinea*; 2, *Salvia pratensis*; 3 and 4, Yellow and white forms of the Banksian Rose (*Rosa Banksiae*).—"Llanrwst."—*Genista hispanica*, "Spanish Broom."—R. F. C.—*Libertia grandiflora*.

This New Continuous Sprayer

These illustrations clearly show the unique features of this New Sprayer, including detachable barrel and adjustable and detachable Jet. The Spray is CONTINUOUS and suitable for use with Insecticides for spraying Roses, Fruit Trees, etc., also for Disinfectants, Fly-killing compounds, etc., in Houses, Factories, Workshops, Ships, Cinemas, etc.

The Jet may be varied from a coarse spray to a very fine mist by merely turning an adjusting screw, every part is easily detachable and accessible for cleaning purposes, and all working parts being interchangeable can be renewed at small cost.

Undoubtedly the finest mist Sprayer on the market.

NICOTINE! NICOTINE! NICOTINE!

No Compound, poisonous or non-poisonous, is as effective or as safe as English-made Nicotine for destroying all sucking insects infesting vegetation. It cannot be bought in a more convenient form for spraying or syringing than as—

CAMPBELL'S NICO SOAP (Nicotine Soap). The best Potash Soft Soap plus 7 1/2 per cent. Nicotine. A teaspoonful will make one gallon of strong spray fluid. Prices:—1/2 lb., 2/-; 1 lb., 4/-; 10 lb., 32/-.

CAMPBELL'S ENGLISH NICOTINE, 95-98 per cent. This is offered to large users or others preferring to make up their own fumigating and spraying compounds. Prices on application.

CAMPBELL'S NICOTINE VAPORISING COMPOUND. Nicotine content, 50 per cent. Prices:—10z., 1/6; 4oz., 3/9; 8oz., 7/6; 1/2 pint, 9/-; 1 pint, 17/6; 1/2 gallon, 61/-.

CAMPBELL'S NICOTINE FUMIGATING ROLLS, very simple and effective. In four sizes for 500, 1,000, 2,000 and 3,000 cubic feet. Prices:—7d., 10d., 1/6 and 2/- each.

CAMPBELL'S PATENT SULPHUR VAPORISER. The best method of exterminating Mildew from plants in greenhouses. In two sizes, for 5,000 and 10,000 cubic feet. Prices:—18/- and 20/- each.

Obtainable from Seedsmen, or, in case of difficulty, direct from the Manufacturer—

"Auto-Shreds" did it!

I just burnt them on the ground and they thoroughly fumigated my plants. The judge wanted the name of the stuff that kept my flowers so insect-free. I told him "Darlington's AUTO-SHREDS." At all seedsmen they cost:
No. 1. (To fumigate 10,000 cubic feet.) For tender or ordinary plants, 6/-
No. 2. (10,100 c.f.) Ordinary plants, 4/6
No. 3. (1,000 c.f.) Ordinary or tender plants, 1/-
No. 4. (2,500 c.f.) do. 1/9
W. DARLINGTON & SONS, LTD.,
HACKNEY, LONDON, E.8.

NOW READY.

Nearly 250 pages, with Index. Over
40 Illustrations and 8 Coloured Plates.

THE PRIMULAS OF EUROPE

With Botanical Classification, Descriptions, and
Cultural Instructions

By JOHN MACWATT, M.B.

Crown 8vo, Cloth, 12/6 net; Postage 9d. extra

The aim of the author has been to produce a handbook that will assist in the identification of those species of the genus *Primula* which are native to the European continent, and at the same time furnish practical guidance to the cultivation of such of them as have been introduced to our gardens where conditions differ so widely from those prevailing in their natural habitats.

Dr. MACWATT is an acknowledged authority on *Primulas*, and his book presents in a concise and interesting manner the results of many years of close personal observation and experience.

Published at the Offices of "COUNTRY LIFE," LTD.,
20, Tavistock St., Covent Garden, London, W.C.2.

The increased rainfall
of the past twelve
months has greatly
benefited these plants.
Our beds this year have
never looked better, and
the crop of fruit, given
some sun, will be phe-
nomenal. We shall hope,
therefore, to be able to
supply vigorous runners
in the autumn, and are
now booking orders for
early delivery.

George Bunyard & Co., Ltd.,
The Royal Nurseries,
Maidstone.

**"Thanks to Abol—
the plants are clean and making
good growth."**

This is typical of what users say of Abol
Non-Poisonous Insecticide—they find that a
regular weekly spraying keeps down the "fly"
and invigorates the plant.

Time has proved that there is no better or
safer remedy for Green and Black Fly, Woolly
Aphis and other pests.

Abol is especially good for Mildew on Roses
and other plants, because it also has such a
refreshing effect upon the foliage.

Perfectly safe to use on all fruits and vege-
tables. Clean to handle; no unpleasant smell;
non-damaging to paintwork.

Used in the Royal Gardens.

An interesting booklet on Garden Pests, with
advice as to treatment, will be sent to anyone,
gratis and post free.

Abol

Non-poisonous Insecticide

In square tins: ½ pint, 1/4 ;
pint, 2/2 ; quart, 3/4 ; ½ gall.,
5/3 ; gall., 9/6. A measure
with each tin.

Abol Non-poisonous Insecticide,
Patent Syringes and other garden
specialities are sold by all Nursery-
men, Seedsmen, Ironmongers, etc.
Sole proprietors and manufacturers,
Abol Limited, 9, Beltring, Paddock
Wood, Kent.

No. 2693.—VOL. LXXXVII.]

[JUNE 30, 1923.]

GARDEN HYBRID CLEMATISES

Excepting only the Rose, the Clematis has no rivals among hardy climbers. In small gardens where they get some shelter we sometimes see them excel Roses, the majority of which thrive best in open situations.

THE many and varied species and varieties of Clematis vary in habit from herbaceous perennials 1 ft. or rather more in height to vigorous climbers with thick woody stems up to 50 ft. or more in length. The Clematis is a hardy climber which every garden-lover can grow successfully. With such a large and varied family there are plants for all positions. Failing a border, because of stone paving or other causes, Clematises to clothe verandahs or treillage in the roof garden may be grown in large tubs or boxes.

The sudden dying away of branches and, finally, of the plants for no apparent reason has been attributed to several causes. Grafting comes in for abuse as the predominant factor in the very large number of losses, but having watched carefully both species and varieties for a considerable number of years I am firmly of opinion that it is almost, if not entirely, a question of soil and position. Examination of the stems of shrivelled branches or plants will shew the bark to be split. This may be due to exposure to sun or frost. The injury is not apparent perhaps at once and fungus may establish itself in the wound, but that is not the start of the trouble.

SOIL.

The first essential is a very well drained soil. If the ground is at all heavy or water-logged, dig in an abundance of builders' rubbish (old mortar, brick and sand); also plant, if possible, on a little raised mound. It is well known that Clematises thrive in calcareous soils, though such are not essential. Ordinary garden soils are improved by the addition of a little well decayed manure and leaf-mould, but the ground should not be made excessively rich. The very vigorous fleshy stems are more liable to split than those of normal growth. A mulching of decaying

leaves and old manure is helpful on light soils in summer and a protection from frost in winter.

POSITION.

From what has already been written it will be apparent that a southern aspect with exposure to hot sun on the older stems should be avoided.

If Clematises are planted in positions facing south, shade should be afforded to the roots and the lower parts of the stems by planting among shrubs. Sometimes moderately tall perennials are employed with satisfactory results. For northern, eastern and, particularly, western aspects, Clematises cannot very well be planted too freely, to clothe walls, fences, arbours, pergolas, arches, porches, trelliswork and verandas. The strongest-growing species, if planted on the outskirts of trees and given a little support to begin with, soon ramble away up among the branches. We have our orthodox methods of pruning, but several times in poking about neglected corners I have come across the old Jackmanni Clematis rather bare below certainly, but with a wealth of growths over an old shed or wall. If this one will thrive, so will hosts of others. Plant them about where Roses and other climbers have failed.

It is worth while, to begin with at least, to give the Clematis some support in the form of rough branches, oak or bamboo for preference, as these last well. These save a lot of trouble in the first year or two's training of Clematises, especially against a wall.

PROPAGATION.

Seeds, cuttings, layers and grafts may be relied on to provide ready and rapid increase of stock. Besides raising the species from seeds it is very interesting work cross-pollinating and raising seedlings in the endeavour to obtain new and improved varieties. Unlike most plants, internodal cuttings produce roots much more freely than those taken in the usual way below the node. Layering is practically a sure method of increase, the stems being bent or twisted when pegged down and covered with sandy soil.

To propagate the named varieties in the huge quantities required by flower-lovers to-day, grafting is the only possible method as a paying

PART OF A GRAND OLD PLANT OF CLEMATIS PERLE D'AZURE
AT GRAVETYE.

recommended proposition. These flower who object to grafted plants can soon solve the problem and have them on their own roots by planting deeply or digging a sloping hole.

As Clematises are almost entirely grown in pots, the question of a suitable time for planting rarely arises. It is probably desirable not to plant from November to January if the plants are to stand in pots.

GARDEN VARIETIES.

Is there any family of handy plants exelling in beauty a representative collection of garden varieties of Clematis? They provide a succession of blossoms from May to September or October. The flowers are large and dainty, and combine rich colouring with a graceful habit of growth. The majority of named sorts have originated by the intercrossing of four species, *C. florida*, *C. lanuginosa*, *C. patens* and *C. viticella*. Because the hybrids from these species have several distinct characters, requiring rather different pruning, with also some differences in flowers and the flowering season, the specific names are in general use to distinguish each section or type. With the continual intercrossing it is not, however, an easy matter in some cases to classify them.

PATENS (AZURE) GROUP. This section is the first to flower, producing a wealth of blossoms in May and June, usually extending into July. Because of its early and free-flowering qualities, this section is valuable for culture in pots for cool and unheated greenhouses. The flowers are produced on the ripened wood of the previous year's growth. It is thus desirable to remove

thin and useless wood in July after flowering. All that can be done in early spring is to remove the thin, unripened end of the shoots. Good sorts include Fair Rosamond, bluish white, pale wine, red bar; Lady Forbesborough, silvery grey; Lasurstein, purplish blue; Miss Bateman, white, chocolate anthers; Miss Quilter, pure white; Mrs. George Jackman, satiny white, cream bar; Sir Garnet Wolseley, bluish red, round, plum, red bar; Stella, light violet, reddish plum bar; and The Queen, lavender.

FLORIDA GROUP. This section has large double flowers and, being produced on the ripened wood, requires light pruning as in the Patens group. The flowering season is June and July. In this section come Belle of Woking, silvery grey; Countess of Lovelace, bluish blue; Duchess of Edinburgh, pure white; and Lucie Lemonie, white.

LANUGINOSA GROUP. In this section are included some of the largest and best flowering Clematises. The blossoms are borne more or less throughout the summer and autumn on the short lateral shoots of the year. If the plants made good growth the previous year the knife may be used fairly freely in February to remove the thinnest wood and straggling ends of the shoots. Space out a little the shoots remaining to furnish the allotted space. There are many sorts, but I will limit the selection here to ten: alba magna, pure white; Beauty of Worcester, bluish violet (has single and double blossoms); Blue Gem, cerulean blue; Fairy Queen, bluish, pinkish bar; Gloire de St. Julien, large white, yellow stamens; Henryi, creamy white; Lady Northcliffe, lavender blue;

Lord Neville, dark plum; Marcel Moser, mauve-violet, red bar; and Nellie Moser, mauve, red bar.

VITICELLA GROUP.—This is a free-flowering type of vigorous growth. The blossoms being produced in summer and autumn on the current season's growth, early free pruning may be carried out in February. A good six are Ascotensis, azure blue; Kermesina, red; Mme. Grange, crimson velvet; rubra grandiflora, red; Ville de Lyon, carmine red; and Viticella alba luxuriens, white.

JACKMANI GROUP. Producing quantities of blossoms in late summer and autumn, this section benefits by harder pruning than any other group of garden varieties. In fact, when only required to cover a low wall or fence I have seen the violet-purple Jackmanni cut annually to within 2 ft. to 3 ft. of the ground in February. The most popular of all Clematises in our gardens to-day, Jackmanni is the result of a cross between *C. lanuginosa* and *C. Hendersonii* made in Messrs. G. Jackman's Woking nursery in 1858. Other sorts to grow in this section are Comtesse de Bouchaud, satiny rose; Gipsy Queen, dark velvety purple; Jackmanni rubra, red; Jackmanni Snow White, pure white; Jackmanni superba, dark violet-purple; Star of India, reddish plum; and The President, deep violet, darker centre.

I would reiterate that shade for the roots and the lower parts of their growth is very necessary for Clematises, and that planting in unsuitable positions is responsible for the vast majority of failures. *Verb. sap.* A O
(Consideration of the Clematis species is held over for a further article.)

THE RICH PURPLE CLEMATIS JACKMANI.
Typical of a series of hybrids.

SNOW WHITE CLEMATIS THE BRIDE.
One of Messrs. Jackman's novelties.

THE CULTURE OF PENTSTEMONS

IT may be said with perfect truth that Pentstemons are largely grown and may claim place among the flowers we term "popular," but so far as England is concerned, and particularly the southern half, my contention is that we but seldom see a good collection of Pentstemons grown in a manner that brings out

winter with little attention until the rush of early spring work is over, and thought turns to planting out the summer-flowering plants.

When the Pentstemons are overhauled, some are found to be throwing up a lanky shoot or two, some look a bit stunted and sickly, and some have "gone west," but they are taken out and

A FINE MASS OF THE SOFT PINK PENTSTEMON DAYDREAM.

in any way their real value. In Scotland, and in the northern counties of England, Pentstemons are more generally grown and are certainly grown with greater skill and care. If asked to express an opinion as to why we do not oftener see this plant at its best, I should submit two reasons, but should hesitate as to which should take priority, for each is in a measure the outcome of the other. My reasons are that southerners have not, generally speaking, the keen appreciation of the qualities of a Pentstemon that northerners have, and that they do not take the pains to grow them well. Lack of appreciation may be accounted sufficient reason for casual treatment, but on the other hand full appreciation of the qualities of a flower can only be aroused when the flower is seen in a high state of perfection, and the probability is that the sight of a batch of Pentstemons that had been skilfully handled and grown to perfection would awaken the enthusiasm that is their due.

It is not that there are mysterious secrets surrounding the culture of Pentstemons, nor is it that their requirements are so exacting that only the exceptionally favoured can provide them, indeed, it is rather the reverse, a Pentstemon makes a fairly good hand at thriving even under unfavourable circumstances, and responds so readily to even the slightest encouragement that all too often the very little help is considered sufficient, and the fairly good attempt at display is accepted as the full measure of which the plant is capable.

It is generally understood that Pentstemons may be propagated from cuttings in autumn and should be planted in their flowering quarters in spring, but if the truth be confessed many a propagator will have to admit that those autumn cuttings are frequently snapped off just as frosts threaten to cripple the plants, are put round the edge of a flower-pot and put away on a shelf or odd corner in the greenhouse to go through the

planted, with the conviction that they will soon "pull round," and with a bit of "feed" later on will make a show.

To secure the finest results a few stock plants should be set apart, their flower spikes removed by the middle of August, and cuttings taken of healthy vigorous young growths from the base as soon as they have formed four or five closely set leaf-joints. It is of great advantage to insert the cuttings singly in thumb pots, rather than putting

several into one receptacle, for thus they may be potted on without once having the check of disturbance at the root. The cutting-pots should be plunged in a frame in a shady place and kept close until the cuttings shew signs of root-formation. Early cuttings will root soon enough to admit of a shift into "sixties" during autumn, in which pots they may pass through the winter, either in a pit or a cool house. Early in the New Year the points of the shoots may be pinched out and, as soon as new growths break from the axils, the plants should be potted on into "forty-eights," and kept cool and well ventilated until good weather justifies planting out.

The bed should be well and deeply dug and some manure worked in, this preparation being carried out a month or two before planting time. Give the plants a couple of feet of space each way and plant firmly. As soon as convenient, select three or at most four well placed and strong shoots and remove the rest. Secure each growth separately to a neat but strong stake and see to it that no green fly or other pest gains a foothold on the points of the young growth.

As soon as flower spikes become visible commence feeding, preferably with liquid animal manure, and if the weather becomes hot and dry, mulch the bed with hops or with stable manure passed through a potato riddle. With such culture some magnificent spikes of large, well formed bells will be produced and the Pentstemon bed will prove to be an outstanding feature in the best furnished garden.

Remember that every check and every delay in the routine of culture, such as postponing potting until the plants are pot-bound and starved, neglecting to water so that lower leaves fall, forgetting ventilation while in the pits, or neglecting staking until wind plays havoc with the young growths, or leaving a superfluity of weak side shoots, will have a marked effect upon the ultimate strength and beauty of the flower spikes and bells. After all, we simply deny ourselves half the pleasure of cultivation by neglecting such simple tasks and unless we afford our plants good culture we can expect no more than just mediocre results. On the other hand, few plants respond more readily and generously to good treatment than does the Pentstemon.

A. J. MACSELF.

THE HERONSBILL FAMILY

THE genus *Erodium* contains in all about fifty species, mostly from the North Temperate regions, although a few are found in South Africa and Australia. More than half this number are in cultivation, but many of them are annuals of little or no garden value. Among the hardy perennials are many beautiful plants which hardly receive the attention they deserve in our gardens. They are ideal for the sunny rock garden and, provided they are given ample drainage, all the dwarf species may be successfully grown. For planting on steep rocky banks or in the crevices of old walls there are no more suitable plants, as they quickly make large tufts and furnish a welcome display of bloom for a long period during the early summer months. Cold, wet soils are unsuitable, as in such situations many kinds are liable to damp off during winter.

Propagation is effected by means of cuttings or seeds. The former should be inserted in sandy loam in June or July, selecting some of the younger shoots with a heel attached. The pots of cuttings should be placed under a bell glass or in a close frame till they are rooted, when they may be

potted off singly and grown on in a cold frame till they are fit to plant out. Seeds may be sown at any time, preferably in spring in a little heat.

The members of this genus cross with each other very readily, and there are numerous hybrids in cultivation. This tends to make the matter of nomenclature very difficult, and thus we frequently meet with the same plant under various names. Both species and hybrids, however, are charming plants and well worth a good position, and if a little care is bestowed on them at the time of planting they will amply repay with a wealth of flower for a long period. Some of the easiest kinds to grow and, incidentally, some of the most beautiful are given below.

E. absinthoides (syns. *E. Sibthorpium* and *E. olympicum*).—This pretty plant comes from Mount Olympus in Bithynia, where it forms tufts of woody stems with silvery leaves some 3 ins. or 4 ins. high. The flower-stems are branching, and during July and August bear its pinkish veined flowers well above the foliage. As an example of the confusion of names, the name *absinthoides* has also been given to a form of *E. chrysanthum*.

E. CHAMÆMELOIS.—One of the best border plants of the family, growing from 6 ins. to 12 ins. high, with masses of silver grey soft hairy leaves, and numerous pure white flowers in July and August. It is a native of Syria, and has proved quite hardy in a sunny ledge. It also reproduces itself by means of self-sown seedlings near the old plants.

E. CHEILANTHIFOLIUM (syns. *E. guttatum* and *E. trichomanefolium*).—One of the most attractive species from the rocky ledges of the Sierra Nevada in Spain. From a mass of woody stems and grey-green, finely cut leaves the flowers are produced very freely during the whole of the summer months. These are almost pure white, but the two upper

ERODIUM CHEILANTHIFOLIUM, OFTEN KNOWN IN GARDENS AS *E. TRICHOMANEFOLIUM*.

ERODIUM CORSICUM GROWING IN A WALL.

E. CHAMÆMELOIS (var. *E. Richardii*) is a tiny species from the Balearic Islands. It forms a carpet of small heart-shaped leaves just above which are borne a little white flow-er which are delicately veined with dark lines. There is also a pink-flowered form of this species now in cultivation.

petals are heavily blotched with dark purple. The plant grown in gardens under the name of *E. guttatum* is a form of this species, but in this the flowers are larger and only one petal is blotched. It may be conveniently called *E. cheilanthifolium* var. *major*. *E. guttatum*, true, is a coarse growing annual from Algeria. There is also a smaller

flowered form grown with greyer leaves. These varieties may, of course, be hybrids.

E. CHRYSANTHEMUM. A native of the mountains of Greece, this plant makes a tuft of silvery fern-like leaves, and bears rich yellow flowers. Many complaints are received of this species failing to produce seed. It may be explained that the plants are unisexual, and it is necessary to get both male and female plants if it is desired to increase it in this way. When planted together it will be found that self-sown seedlings will appear near the old plants. It is one of the best and most attractive members of the whole family. *E. c.* var. *album* is a pure white form.

E. CORSICUM.—One of the smaller kinds, this grows from 1 in. to 4 ins. high, and produces small orbicular leaves that are softly hairy and deeply crenate. The flowers are $\frac{3}{4}$ in. in diameter and vary in their shades of rosy pink, while the veins are of deeper colour. They are produced from May to September. This species is found growing on granite rocks by the sea, in Corsica and Sardinia.

E. DAUCOIDES comes from the Sierra Nevada in Spain and is only a few inches high. It has very hairy grey leaves and whitish flowers, with a darker blotch on the upper petals.

E. GUICCIARDI.—One of the taller and more handsome kinds with tufts of silvery grey leaves up to 6 ins. high. These are finely cut and very elegant. The rosy pink flowers are produced in the later summer months on branching leafy stems 1 ft. to 1½ ft. high. A native of Northern Greece, it is one of the rarer species in cultivation.

E. HYMENODES.—For planting on a rough rocky bank with a sunny aspect there is no plant more suitable than this North African species. In such a place it will make itself at home and reproduce itself freely from self-sown seeds. It reaches a height of from 1 ft. to 2 ft., and has rounded, lobed leaves on long stalks. The inflorescence consists of eight to ten flowers, which are nearly white but veined with pink, while the two upper petals are blotched with rosy purple near the base. The whole plant is clothed with soft hairs, and it is very free-flowering, coming into bloom early in the year and continuing till frost comes. This plant is frequently met with in gardens under the name of *E. pelargoniflorum*, which species is a native of Asia Minor. The latter may be distinguished by the awn-like tip to the sepals, otherwise the plants are very much alike.

E. KOLBIANUM is a hybrid between *E. supra-cannum* and *E. macradenum*, intermediate in habit, nearer to the latter in height, but with lighter-coloured flowers of larger size.

E. MACRADENUM.—A free-growing plant from the Pyrenees, which quickly forms handsome tufts of finely cut green foliage on woody stems. It only grows about 6 ins. high, with umbels of six or more flowers, on stalks reaching well above the foliage. In these the lower three petals are white, veined with deep pink lines, while the upper two are blotched and veined nearly all over with dark purple. It is one of the easiest and hardiest species. *E. m.* var. *Willkommianum* is a variety of this with larger flowers which are lighter in colour.

E. MANISCARV. This is more of a border plant, but comes in useful for the larger rock garden. It grows about 2 ft. high, with deeply divided pinnate leaves and purplish red flowers in summer.

E. PETRAEUM. Very compact in habit with short woody stems and finely cut green leaves, this is a very free-flowering kind valuable for the rock garden. Although the flowers are only borne two together on each stalk, the stalks are very numerous. In colour the petals are all rosy pink, veined with darker lines, and are produced throughout the late spring and summer months. A strong growing hybrid of this with taller, more

robust habit is a handsome plant with six or more flowers to each umbel, but the individual flowers are very little larger. It is generally known as *E. macradenum roseum*, but bears no relationship to that plant. A native of Spain, this plant has been grown in gardens under the names of *E. trichomanetolium* and *E. cheilanthifolium*.

E. SUPRACANTUM.—A charming low-growing kind from Spain with beautiful silvery leaves that are harder in texture than in *E. chrysanthum*. The flowers, three to each stalk, are pale pink, or nearly white, veined with deeper pink lines. *E. s. var. album* is a pure white-flowered variety without veins. There is a hybrid in gardens

between this plant and *E. macradenum* known as *E. supradenum*. This has silvery foliage, but the flowers approach those of *E. macradenum* in colour.

E. TRICHOMANETOLIUM is a Syrian species which I have not seen. It has densely glandular leaves, and other plants do duty for it in gardens. W. L.

COLOUR-GROUPING IN A KENTISH GARDEN

MAY sunlight on a flashing sea to the south, northward the pale swell of the Downs, beneath one's feet, facing seaward, the turrets of an ancient castle looming amid trees, and the square tower of a noble church, also half hidden by foliage. Lower still the spires and roofs of a nestling town and then the great expanse of shingle which sweeps round to the far curve of Dungeness—all this makes a charming setting to a very different scene which may be found near by, a scene shaped lovingly by the hands of cultured men.

For near this picturesque town of Hythe, and nearer still to this gem among villages—Saltwood—lies the Garden House, a beautiful dwelling seated on the sunny slope of a gentle hill, with castle and church and sea below, and within its grounds a sheltered and secluded valley that has been made into one of the most charming gardens the mind can conceive.

The garden, be it said, was begun long before the house. I believe it was a former incumbent of the benefice of Saltwood who first realised the possibilities of the valley, with its sheltered site, as a garden. Perhaps it is a hundred years or more since the idea first germinated. It was certainly an incumbent, although of a later

generation, who gave the garden fame. He was a Hodgson, and the name of Hodgson is still given honour in horticultural Kent. Because Mr. Hodgson put in a quantity of what were once classed as "American plants," and gave them the wherewithal to flourish, the garden became known as "the American Garden." It bore that name for half a century and, in our country, names stick. One may still hear people speak of "the American Garden at Saltwood." The title might, however, drop. American plants do not now predominate here and although the present owner is ever ready in the generosity of his nature to throw open the garden to appreciative visitors, it is purely a private place.

When the already famous garden fell into the possession of Mr. A. C. Leney, he developed it lovingly. He built too, the fine and handsome

THE FINE PLANT OF CLANTHUS REFERRED TO.

dwelling of which it is one of the most distinguished ornaments. A spacious house, it is yet perfectly homelike. Broad terraces surround it. There are roomy borders beneath the walls, supporting a splendid range of creepers and shrubs. The scene from its terraces is one that lingers on the mind.

In a bygone year I remember seeing on one of the walls of the Garden House—it was a northern or north-western wall I think—a plant of that singular and impressive New Zealand legume, *Clanthus puniceus*. I recalled that memory to Mr. Leney in the present year of grace, and forthwith he led me round to the south side and showed me a successor to that old-time plant—a successor without of trebled size and effect. One of the photographs which accompany these notes depicts it. It was a wonderful plant, spreading like a luxuriant Peach tree and laden with innumerable flowers. To see a plant like this, as happily and as full of bloom in the open as a Cornish Fuchsia is a rare experience.

The greatest feature of the garden proper is certainly supplied by the Rhododendrons. Mr. Leney is a warm lover of this marvellous evergreen, and not only does he plant all the meritorious novelties as fast as they come out, but he cultivates them thoroughly and thereby gets fine specimens. Still further, he "places" them with the utmost care, in order to secure beautiful colour-harmonies. Rarely does one have an opportunity of seeing such glorious colour pictures, at once opulent and refined, as one sees here.

With respect to varieties, perhaps the gem of the collection on the day of my visit was *Loderi*, admirably grown and supremely beautiful. *George Hardy* was magnificent, too, and very appealing in its delightful shade of colour. Besides these noble varieties, even the once-worshipped and still popular *Pink Pearl* suffered. *Cornubia* was in very fine condition. In sheer size and beauty the peerless *Falconeri*, here grown out of doors, was almost unequalled. *Campylocarpus*, *Smithii*

A SPRAY OF THE SCARLET CLANTHUS PUNICEUS.

aureum and Corona were other gems of the collection. Indian, Mollis and Ghent Azaleas form a beautiful subsidiary feature.

There was great interest in huge plants of *Solanum crispum*; in the stately *Gunnera manicata*; in the Japanese Maples, of which there is a good collection; in the Camellias; and not least

in *Rhododendron Cunninghamii*, forming a foreground to an old tree covered with *Clematis montana*.

Space does not permit of further details, but Mr. Lacey is always ready to share his joy in his beautiful garden with any true flower-lover, and a visit is a pure delight. WALTER P. WRIGHT.

GARDEN CONSTRUCTION

I.—The Elements of Terracing.

SO many gardens are to be seen in which the terracing is badly managed that it may be worth while to write shortly on this subject alone. Bad terracing is neither confined to small gardens nor yet to modern ones; some of the largest gardens in Britain are

taken to make a section of the whole series of terraces concave, whereas the series shown in Fig. 1 is convex. Fig. 3 contrasts a concave stairway with a convex one; a series of terraces is really just a stairway with gigantic "steps" of varying widths and treads. Further, it is

disfigured by bad terracing, and bad old work is plentiful.

The principal fault is illustrated in Fig. 1. Sitting, or even standing, on the topmost terrace, one gets only very awkward partial views of the gardens below, except the terrace walk in the immediate foreground. The seated figure in the diagram, indeed, can see nothing of the expanse of formal gardens except the hedge which marks the further boundary of the lowest terrace. His companion, who is standing, gets partial views which are almost worse than seeing nothing at all! The terracing is shown as steep embankment.

Banking at the angle which is feasible for mown turf (2ft. rise in 7ft.—see Fig. 2) is less likely to cause such unfortunate obliteration and, as we might expect, walling is the most difficult kind of terracing to manage satisfactorily. Reference to the dotted-in sitting-height parapet, marked "A" in Fig. 1, will show that such walling accentuates the disastrous effect. A parapet is obviously necessary with a retaining wall of any height, so that retaining walls, unless very carefully placed, are doubly disadvantageous.

How, then, may the unpleasant effect we have demonstrated be avoided? In most cases very simply. In the first place, great care should be

almost always traversed by stairways in which the flat breadths of terrace serve as landings—extremely wide, sometimes, it must be admitted!

Let us now refer to Fig. 1 again. Assuming that, originally, the terracing was carried out without importing soil from a distance, the original gradient must have been somewhat as represented by the line BC. Let us take, then, a slope such as that represented and see what can be done with it. We shall now find that concavity of the terracing alone will not solve our difficulty, but that a certain ingenuity is necessary in the design if the effect is to be all it might be. The slope selected is shown by the interrupted line BC in Fig. 4. Now, in order to obtain concavity it will obviously be better to maintain the height of the topmost terrace, and for the same reason we should provide straight away a considerable fall. Let us, then, excavate below the mean level to a depth sufficient

to provide the earth necessary to make the topmost terrace—that is, to X in the figure. We shall then easily arrive at some such arrangement as is indicated (mainly by dotted lines) at NOPQ. Since the bank OP lies on the line of sight of an observer on the topmost terrace, the whole of the planting on the terraces NO, PQ is now in view by anyone leaning on the retaining parapet at M. This notwithstanding, it is obvious that the arrangement is anything but ideal, owing to the disproportionate size of the bank OP. The problem now is to produce a treatment which will obliterate this ugly bank without sacrificing the view from the parapet M. This may be done by introducing walling at O and so treating the ground which lies out of sight from M that it forms a feature entirely distinct from the area already denoted by the letters PQ. It may be noted at once that further excavation at O will produce a quantity of extra earth which, unless otherwise disposed of, will raise the height of the bottom terrace PQ.

It will, obviously, be better to insert a terrace path (XY) than to have sheer walling. Besides the gain in appearance afforded by this arrangement, we have provided a very pleasant sheltered walk from which an excellent view is obtainable of the lower garden. The whole scheme is thus shown in plan lines (BMNWXYZIV), in which TV is laid out as a garden complete in itself so as to form a satisfactory picture from the upper terrace. The treatment of the upper terraces, and indeed of the whole scheme of gardens, must be worked out in plan as well as in elevation, and if the amateur designer possesses the gift, it is well to draw in perspective views of the completed gardens from various aspects. The professional designer, it worth his salt, will not need to do this—unless to explain a design to a client—but the

FIGURE 3.—THE CONVEX AND THE CONCAVE CONTRASTED!

ability to visualise a complete design without the aid of pen or pencil comes only with training and experience.

There is no law which can be invoked to conjure up a series of terraces. The scheme suggested is not laid down as the only suitable one for the slope under consideration, nor even as the best under the conditions given. There are quite a number of distinct ways in which such a slope could be laid out, and the best placing of the separate terraces might well depend upon interconnexion with other parts of the gardens—the garden designer has always to think in terms of cross-views. The style and size of the house, too, must necessarily affect to very great extent the character of the terracing which supports it. It is not, then,

FIGURE 4.

the actual design which is held up to imitation, but the method of work which led to it. The professional often meets a problem of garden design which taxes all his ingenuity and takes a considerable amount of time to solve; the amateur must be content to find what seemed, at first blush, a promising scheme turn out quite impracticable when reduced to exact measurements, for in this, as in most other arts, there is no royal road to success. Terracing simultaneously from two directions brings in a variety of complications with which it is not practicable to deal in a single article. It is certainly wise, moreover, in such a case, to call in the services of a qualified garden-architect.

In a subsequent article we propose to deal with the treatment of the several levels in a complete scheme of terracing, for the art of terracing needs considering in plan as well as in elevation. It will be seen from the points already made that if expert help is invoked, a fairly free hand should

be allowed, since to follow the unconsidered requirements of the owner may well be entirely to ruin the design.

There is a movement afoot to depreciate "paper-gardens," as those gardens which are properly planned are slightly called, and the detractors of the planned garden talk wisely of a garden as "a place to accommodate well grown plants." It must be admitted that a certain school of house architects with no real knowledge of plants have done garden design much disservice; but exaggerated statement leads nowhere, and the definition of a garden given above does not appeal to the writer. Substitute "see" for "accommodate," and the importance of adequate design at once becomes evident. The garden designer has Nature herself for an ally, and there is a fascination about sketching in the outlines of a picture which, if firmly lined, will *complete itself*, which can scarcely be exceeded in any other branch of art.

THE HYBRIDIST AND THE LUPIN

DURING the past two years we have seen some remarkably fine new Delphiniums, and improvements in other hardy herbaceous plants have not been wanting, yet, with the possible exception of the Bearded Iris, no plant has of late years recorded such progress as the Lupin. On second thoughts it is perhaps scarcely wise to except even the Iris; for, probably, progress with that flower has been less spectacular than with the Lupin.

Less than a generation ago the herbaceous Lupin was an affair of rather sombre purplish blue colouring, varied by an occasional dingy white. The first noticeable variation—a so-called pink—was of Continental origin. This was probably—almost certainly—obtained by crossing other species of *Lupinus* on to the old and dingy *L. polyphyllus*. Subsequently the Tree Lupin was used as a pollen parent and, largely by its influence, we have to-day not only good whites and yellows—which, though herbaceous, shew a deal of the Tree Lupin in their habit of growth—but wonderful clear blues and exquisite mauve shades. By careful selection it is now possible to obtain almost every conceivable shade of blue or purple, from the strongest to a faint suffusion where the colour gives little more than a delicate washed effect. Many of the most beautiful varieties are bicolors of blue or purple and yellow or white, while distinct shades of the same colour on wings and standard are common also.

The first-raised "pink" varieties were pleasing enough when the blossoms opened, but as the lower

ones went off they took on a purplish tinge (almost the hue of decaying meat), which was anything but lovely. Some of the newer introductions are

NEW GIANT GOLDEN TREE LUPIN LIGHT OF LODDEN.

much better in this respect, though there is still room for improvement. From these "pinks" some truly remarkable colours have been evolved, culminating in Downer's Delight, a tall and imposing variety of reddish terra-cotta hue. Mr. Downer's strain recently received a well deserved award of merit from the Royal Horticultural Society—vigour and size of spike are particularly

noticeable in this strain—but it must be borne in mind that the "red" shades are apt to clash badly with the blues and purples.

The Tree Lupin, *Lupinus arboreus*, is pleasantly scented and some of the herbaceous *Lupinus* with "Tree blood" have inherited this precious gift of fragrance. Notable in this respect is the delightful Six Hills strain, which last year at Vincent Square secured an award of merit, for which, no doubt, their fragrance was largely responsible, though the colourings shewn by this strain are very charming—delicate shades predominating. In the North of England, especially, yellow, buff, and bronzy shades have received a deal of attention and the well known north-country house of John Harkness and Sons of Bedale are to the fore with these. With yellow, buff, bronze, "pink," "red," blues and purples of varying intensity and pure and ivory whites, the herbaceous Lupin has, indeed, developed a wonderful colour-range.

The Tree Lupin, that rather short lived but quite indispensable plant for the back of the herbaceous border, is also being improved immensely. Good white and rich yellow forms there have been for a long time now; though they are no more valuable than the old soft yellow form, which is, indeed, well high indispensable. Cross pollination with the herbaceous varieties, however, has produced a number of forms delicately tinted with blue, mauve or pink. A Tree Lupin really strongly tinted in these colours the writer has yet to see, though he has heard talk of such; but, judging by the spikes shewn, the new buttercup yellow, Light of Loddon—which obtained an award of merit at the meeting of the Royal Horticultural Society on June 12—marks a real advance, for the colouring is rich and pure, the spike shapely and, for a Tree Lupin, of immense size. The Lupin has made tremendous progress of late; it is destined to make much more in the near future.

THE CAMASSIAS

CAMASSIAS belong to that omnibus race of "ought to be more grown" (Hort. writers) which at once defies any hard-and-fast definition and yet is fairly easy to recognise by those who garden. My Camassia bed, in which there are several species and varieties growing side by side, has made it clear to me that, for the time being at any rate, the whole family must be tentatively added to it. "What are those tall blue flowers?" "I have never seen them anywhere, and they are nice." "I must have nice." These were the sort of remarks made by visitors when they saw my little show this year. They seem to me to be typical of what a considerable number of people might say, for one does not at the present find them here, there and everywhere like Rambler Roses or Darwin Tulips. This might seem to suggest what I can only call "rather a tall order," but why should it not be so—the best at any rate? They have hardiness, prolificness, beauty and a potential usefulness to recommend them. They reverse the order of things when we think of the introduction of Tulips into Western Europe. The first consignment of Tulips that ever came from the East might easily have been the last. Just to see what would happen a few were saved and planted in a kitchen garden, as they were presumed to be a new article of food; and it was not until they bloomed that their decorative value was known! Camassias, on the other hand, have left their culinary usefulness behind them in North America, and we should no more think of planting them in the kitchen garden, as if they were Onions or Potatoes, than
